Q. Do you know that there are about 1300 trains in Arkansas, on the Iron Mountain alone, in one month?
A. I don't know anything about that.
Q. But you think these 18 trains out of 1000, would be fairly representative of the percentages as you have given them here?
A. Yes, I think it would, because in taking that we represent all of the territory; practically all of the territory.

Mr. MOORE: You do not intend to testify that there are 1300 cars a month——
Mr. HILL: No, I asked him if he knew.
Mr. MOORE: Mr. McPherson says you are mistaken.
Mr. HILL: How many are there, Mr. McPherson?
Mr. MCPHERSON: I should think 15% of that.
Mr. HILL: Local trains run in a month.
Mr. MCPHERSON: Yes.

Mr. HILL:

Q. What do you define a terminal expense to be, Mr. Whittenton?

I find some difference of opinion about that, and I would like to get your definition of what a terminal expense is, as you have referred to it in your testimony here.

A. I understand by terminal expense, anywhere that freight originates. In other words, its initial and final destination—the point of origin and its destination.

1994 Q. That is your definition of a terminal expense?

A. Yes sir.

Q. How do the expenses of terminals compare one with another—extensive terminals, say of a city like St. Louis, with a terminal in a small country town?

A. I do not know; I have never had any experience in a terminal like St. Louis, Judge.

Q. Say Little Rock, then: how does the terminal expense at Little Rock compare with the terminal expense at Plummerville?

A. The terminal at Little Rock, in my opinion, would be more expense; a larger terminal as a general thing is.

Q. I do not mean that the terminal would be more expensive; I mean the terminal handling of a ton of freight.

A. That will depend, of course, upon the facilities. You might spend a great deal of money and get a facility that you could handle your business very cheap with, but if you did not have a modern facility your terminal expense for handling might be heavy.

Q. I am not talking about what might be. I am trying to get down to actual facts. In your experience as a railroad operating man, which do you think is the most expensive, a terminal like Little Rock, or a small country town like Plummerville?

A. Well, take our expense (and when I say our, I mean the Rock Island) at Little Rock; our terminal expense there is high because our facilities are not the best, and the terminal expense at Little Rock, compared with a place like Brinkley—local trains that run to

1995 Brinkley, it is higher at Little Rock, per unit, than it is at Brinkley.

Q. What do you say about that as a general proposition, whether the terminal handling at a small country town or at the larger cities, is the more expensive handling, per ton?

A. I expect that the cost at the smaller terminal is larger per ton, than at the larger terminal, because of the volume of business handled.

Q. Why is that?

A. It is due to the amount of business that is handled there.

Q. Would a larger terminal expense, distributed over larger tonnage, reduce the amount per ton at large stations to something like what it would be at the small stations? Is that the idea?

A. That is the idea.

Q. Of course you understand how cotton is handled in Arkansas?

A. Yes, I know something about it.

Q. How many terminal handlings does it have before it gets out of the state?

A. Well, it generally has about three handlings before it gets out of the state.

TORN PAGES

Q. Three terminals in the handling of cotton, as a general proposition, including its final shipment to the east?

A. I think that about covers it.

1996 Q. How is grain handled?

A. We have very little in Arkansas that is purely state business.

Q. Yes, I suppose intrastate grain traffic is what has been denominated in this case as a "negligible quantity."

A. I don't know just what that is. I know our grain intrastate in Arkansas is very little.

Q. I am speaking of grain shipped into the state and distributed throughout the state: that is very large, is it not?

A. Yes.

Q. How large is that?

A. Generally that comes into Little Rock; goes to an elevator; is unloaded, reloaded and shipped out again.

Q. How many terminal handlings in the state, taking the usual course?

A. If delivery is in the state—its final destination when it comes out of the elevator, it would have three, I guess.

Q. How is lumber handled that is carried into the planing mills on the rough material rates: how many handlings does that have?

A. You refer to the rates——

Q. I said carried in on the rough material rates. You of course understand that movement?

A. I don't know that I do; I don't profess to know anything about the rates; I don't know a thing in the world about them, but

1997 I know that lumber is loaded at the smaller mills, for instance, and some places loaded from sidings—mills in the interior, in the rough, and hauled to some larger planing mill and there unloaded; goes in and is planed and finally comes out and is loaded again and goes to its destination.

Q. A great majority of that goes to its final destination out of the state, does it not?

A. I expect that is true.

Q. It goes out of the planing mill (whether out of the state or not) or to some other point in the state, on a rough rate from the point of origin, does it not?

A. I do not know a thing about it, Judge.

Q. Is that out of your jurisdiction?

A. Yes, that is out of my jurisdiction.

Q. Well, assume that that would be the case; then how many terminal handlings would you have of that—say it started from some little place on your line and is carried to a larger place where there is a planing mill and there dressed and then shipped out to St. Louis?

A. There would be the same as in the grain; or cotton rather more nearly describes it. There would be the handling at the point of origin; it would have to be handled again where it was unloaded in the planing mill, and again when it was loaded up and shipped out.

1998 Redirect examination.

By Mr. MOORE:

Q. Mr. Whitenton, do you say a larger part of the expense incident to the handling of intrastate business is the switching that grows out of it; the terminal expense and the additional train cost involved in handling it, owing to the consumption of fuel and supplies of that character, which you say is increased by reason of the switching service and wear and tear of equipment? Those are part, at least of the elements that enter into the increased cost of handling state business, is that what I understand you to say?

A. Yes sir.

Q. Now, suppose, taking the example put to you by Judge Hill, that you have a local way train going from Little Rock to Van Buren; 50% of your loading on that train is interstate freight going to Van Buren, and the balance of the loading on that train is freight for local distribution; would the way freight going to Van Buren produce any expense in the way of switching or things that grow out of it, and the station service that is required—would there be anything of that sort required in hauling that freight through from Little Rock to Van Buren straight?

A. At intermediate points, you mean?

Q. Yes.

A. No, it would require there only the initial and the final.

1999 Q. There would be no service involving switching and delays, increased consumption of fuel and supplies on account of that through freight that was shipped from Little Rock to Van Buren?

A. No.

Q. And yet there would be a very large additional expense growing out of the necessity of intermediate service in distributing the local freight, would there not?

A. Yes sir.

Q. The average length of haul between state and interstate, would in that case, and generally, govern to a large extent the cost of handling the traffic, regardless of whether it was handled in a local or through train, would it not?

A. I think so, if, as I stated before, it was a question of long and short haul as to the distributing expense.

Q. Speaking of terminal stations—terminal service, the sense in which you use that word as between state and interstate business, is that service connected with receiving of freights at the places at which they are received for shipment, including everything incident to receiving them—clerical labor and every sort of labor and the service that is incidental to the delivery of it at the station to which it is consigned: that is what constitutes terminal expense, is it not?

A. That is the terminal expense, certainly.

2000 Q. In that sense, is it or is it not true that every station, as to the freights received or shipped at that station, is a terminal expense?

A. Most assuredly.

Q. You were speaking about terminal expense; Judge Hill asked you if there were three handlings on cotton in the movement he mentioned, and which I need not go over again; he said terminal handlings, and you stated there were three terminal handlings: are there three terminal handlings in the sense that you used that, in the cotton movement to which Judge Hill called your attention?

A. Well, there are three handlings——

Q. I know, but are they terminal handlings, in the sense in which you use that with reference to the difference of expense as between state and interstate?

A. When I answered Judge Hill's question I thought he was asking how the cotton was handled that moved out of the state. It is loaded at the local station, moved to the compress, there unloaded and loaded up again; there is some expense on both at the compress point to the railroad company.

Q. Speaking of grain: is that loaded by the railroad company or the owner?

A. That is loaded by the owner.

Q. In regard to the rough material, forest products: is that handled in loading or unloading, by the carrier or by the owner?

2001 A. By the owner, in carloads.

Q. I will get you to explain a little more fully in regard to the three handlings of cotton that you spoke of: just as far as you know, state what the handling and expense incident to the handling of each of the three handlings is.

A. Well, the expense at the initial point, or at the country station, we will say for instance, at Ola, going to Little Rock—we pay so much a bale for loading that cotton in the car; that goes to the compress; it is unloaded by the compress and we have a man there to check it out; the railroad pays that check clerk.

Q. That is service rendered by the railroad at the compress?

A. Yes, when the cotton is unloaded. Now, when that cotton goes out of the press we still have a man there to check it as it goes into the car.

Q. It is loaded by the compress, is it?

A. Yes, it is loaded by the compress; that costs the railroad at the compress—the unloading and loading at the compress does not cost the railroad, but we —at least the Rock Island—checks its cotton out to the press, and into the cars from the press again.

Q. Save the expense of the check clerk, that is one handling, so far as the expense of the handling is borne by the Railroad Company: that is, the handling at the place of origin?

A. Well, there is some other expense at the compress point to the railroad.

2002 Q. Please explain that.

A. Taking into account the way-bill, and then billing the cotton out again after it is compresed and loaded up.

Q. In shipping the cotton out from the compress you have pretty much the same service as at the point of origin, except that the compress loads it?

A. Yes sir.

Q. But in unloading it there you have a check man to take account of it?

A. We have a check clerk to check the cotton to the compress, to check over and receipt for it; when it is compressed and loaded we have him check it into the car and receipt to the compress for it.

Q. And bill it, I suppose?

A. It has to be way-billed.

Recross-examination.

By Mr. HILL:

Q. Mr. Whitenton, is not the company also at the expense of shipping that car to the compress, taking it into it and taking it out?

A. Oh, yes, a car has to be switched into the compress to be unloaded, and picked up by a switch engine again when it is loaded and taken out.

Q. Mr. Moore spoke about the car being loaded and unloaded by the compress: is not all carload freight loaded and unloaded by the shipper and consignee?

2003 A. What I call carload freight is—of course we load cotton ourselves at the local stations.

Q. That cotton goes into the compress less than carload, does it not?

A. I think that is true.

Q. Of course, you make up a full car of it if you can, but it will be made up of less than carload shipments constituting a car of cotton?

A. It is considered a less than carload commodity.

Q. Until after it is compressed and re-shipped; then is it not shipped as a carload commodity?

A. I don't know as to that, Judge Hill; I would not say positively.

Q. As a matter of fact, are not these three terminal handlings more expensive than the average terminal handling of commodities which your road handles in Arkansas, taking into consideration the less than carload movement, the casualty risk and the extra men you have there to check it out and in: would not that make the terminal handling on cotton more expensive than the average terminal handling on your traffic in Arkansas?

A. Well, it would be more expensive than some other traffic; I don't know how it would average up with the general line. I do not believe it would be more expensive than the terminals necessary for handling high class freight, such as merchandise package freight or freight of that character.

2004 Q. I expect that is true, but it would be more expensive than handling low grade commodities, such as coal, brick, sand and hay?

A. I think it would.

Q. Well, thinking over the difference, would you not say that

the average of each one of those three terminal expenses would be higher than any other one terminal expense on the average of your traffic?

A. I will answer that in this way:

I think regarding the handling of cotton, that the cost of handling it would probably be up toward the top of the list as compared with other commodities.

Q. And the terminal cost of handling would be up toward the top of the list?

A. That is what I refer to, the terminal cost; I had that in mind in the answer.

The MASTER:

Q. Who pays the compress for compressing the cotton?

A. I don't know.

Mr. HILL:

Q. You estimated the cost of handling state business higher in Arkansas, than you did in Missouri, did you not?

A. Well, I don't know about that; it has been some time since I testified in the Missouri case.

Q. I have a copy of what I believe is your testimony. This was a question and answer, as I find it here, by Mr. Hagerman:

2005 "Q. What is your judgment as to the extra cost of doing state freight business over the interstate?

"A. It is my judgment that the extra cost will run from three to six times as much.

"Q. Do you make that estimate upon a ton or revenue basis, or just generally leave the court to determine what is the true basis?

"A. I had in mind when I answered the question, a ton mile basis.

"Q. Putting it on a revenue basis, what would you say, if it makes any difference?

"A. My opinion on that would be it is about twice as much."

Q. Is not that a correct statement of your testimony?

A. I think that is probably correct.

Q. You stated over here that you thought the revenue basis was a better basis of dividing the expense between state and interstate, than the ton mile basis: why do you say that?

A. It would seem to me that you are conducting a business on the amount of money you get out of it, and you want to know what it costs you. It seems to me that you have got to take the money side on both ends of it to get at that.

Q. Why would you use the revenue derived from your state business as a factor to determine the cost of your state business?

2006 A. I am not qualified to answer that because I am not an expert on any of the theories that have been put forward as to the division. It just seems to me that if I was running a business, I would want to know what I was getting out of it and what my expenses were. I would take the money end both ways.

You understand, as an operating man I know nothing about the

revenue of the company, in so far as what we are earning on any class of business is concerned.

I simply have to do with the expense of conducting the business, and here, in keeping out tabulations and figures, we figure what it is costing us to do our business.

Q. As a business man, do you think that you ought to take the gross earnings to determine the cost of conducting that business?

A. As I said, I am not qualified—if I was running a dry goods business and wanted to know what I was making out of it, I certainly would want to know what the gross earnings and operating expenses were.

Q. But here the gross earnings are taken to find out what the operating expenses are?

A. I don't know what they are taking.

Q. Then you do not understand what theory they are basing this on, do you?

A. No, I do not.

2007 Redirect examination.

By Mr. MOORE:

Q. You made an affidavit in this case in August 1908, did you not, prior to the time the application for an injunction was made at St. Paul?

A. Somewhere about that time; I do not remember the exact date.

Q. Do you recall what your statement was then, as to the difference in expense—in that affidavit?

A. If my memory serves me right, my affidavit was to the effect that the extra cost was more than twice as much.

Q. I want to ask you if your views have undergone any change or modification since you made that affidavit and testimony in the Missouri case? If so, state fully in regard to it, and what brought it about.

A. When I made the affidavit in 1908, in the Arkansas case, it was at a time that I had not given the matter any special study or thought. I was simply basing my testimony on my experience, without having made any special investigation. I made what I believed was a conservative statement.

After I got into the matter and studied the various elements that go into the handling of the business, why, when I testified in the Missouri case, I thought that that was about the ratio in Missouri, being familiar with the Rock Island lines in Missouri, on account of having operated them for 2½ years. I put that figure,
2008 which I considered at the time a conservative figure of the extra cost in Missouri, for the Rock Island lines.

Now, my testimony in this case and the figures that I have given here, are based upon what I now believe, after having considered the matter further and taking into account various items of what seem to be to me, extra items of cost. For Arkansas my figures give about the same ratio that I think one bears to the other.

In other words, the more I go into this thing, the more thoroughly

I become convinced that there is an extra cost in handling the state business as compared with the interstate because it is largely a short haul business. That which I put in my first statement or first affidavit, was entirely too conservative, but it is greater than that first affidavit.

Mr. MOORE: We offer "The Western Classification No. 47" as an exhibit, which is accordingly marked "Plaintiff's Exhibit 49", and which exhibit is in the words and figures as follows, to wit:

For Exhibit 49, see Volume 8, page 5416.

2009 The Complainants here rest.

2010 R. E. KIMBELL, being recalled on behalf of defendants, testified as follows:

Direct-examination.

By Mr. HILL:

Q. You have been sworn as a witness in this case?

A. Yes, sir.

Q. I wish you would turn to your Exhibit #32; what does that show your revenue from State freight traffic to have been for six months ending Dec. 31st, 1907, in the State of Arkansas?

A. $173,064.45.

Q. What does that Exhibit show your revenue on interstate freight traffic in the State of Arkansas for that period?

A. $1,597,230.02.

Q. Please turn to Exhibit 35, that is one of your exhibits, what does that exhibit show the state tons carried one mile in Arkansas to have been for that same period; that is, six months ending December 31st, 1907?

A. 8,512,807.

Q. What does it show on interstate business?

A. 184,831,455.

Q. If you divide the revenue by the tons carried one mile, on which that revenue was earned, the result will give you the average revenue per ton per mile will it not?

A. Yes, sir.

Q. Please make these two calculations, and tell what was your average revenue per ton per mile in Arkansas, on these two classes of business, for the six months ending December 31st, 1907?

2011 A. On the State business, the average revenue per ton per mile $0.0203.

Q. That is 20 mills, to put it in mills?

A. Yes, sir.

Q. It would be 20 mills and a third, to put it in round figures?

A. Yes, sir.

Q. On the interstate business?

A. $0.0085.

Q. That would be 8 mills?

A. 8½ mills, you might say.

Q. We have 8.64 mills here, the way we figured it?
A. I have figured it over, it is 0086.
Q. That would be 8 mills and 6 tenths?
A. Yes, sir.
Q. I hand you what purports to be a statement of the St. Louis, Southwestern Railroad Co., for the State of Arkansas, statement of trans-State, Interstate and State freight, handled during the month of January, 1909, and ask you if you recognize that statement?
A. Yes, sir.
Q. Is that a correct statement of what it purports to be?
A. Yes, sir, it appears to be a copy of a statement I filed.
Q. You gave that statement to Mr. Wharton?
A. Yes, sir.
Q. I will ask you to attach this to your deposition and mark it Exhibit "A."

2012 For Exhibit "A," see Volume 9, page —.

A. I will do so.
Q. I call your attention to the statement that the average revenue per ton per mile shown in Exhibit "A" is 39.867 mills; that is on state business?
A. Yes, sir.
Q. And what is the average revenue per ton per mile of the interstate business?
A. 9.454 mills.
Q. During the time that your Exhibit- 32 and 35 were made up, that is, for the six months ending December 31, 1907, the State revenue was produced under Standard Distance Tariff #3?
A. Yes, sir.
Q. During the time that your Exhibit "A" was made up, that is for the month of January, 1909, your revenue was produced under tariff made by your own company, without any State regulation, was it not?
A. Yes, sir.
Q. That was the tariff that was put in November 2nd, after the injunction was obtained by you in this suit, was it not?
A. Yes, sir.
Q. You made an increase in your interstate rates, about the time or shortly after you increased your state rates, did you not?
A. That is true, yes, sir.
Q. Now, I will ask you to compare the amount of average revenue per ton per mile on your state business in January, 1909, of your state business in this period of six months, and com-
2013 pare the same figures with your interstate figures, and I will ask you if this is not a fact, that your interstate revenue per ton per mile was increased 9.4% and your state revenue was increased per ton per mile 96.1%; there is the calculation that might aid you?
A. The increase in interstate business was 9.4%; state business was 96.1%,: figured on the average rates.
Q. Turn to exhibit #33 please?

A. Yes, sir.

Q. It shows your gross freight revenue in Arkansas for the six months ending December 31, 1907, to be how much?

A. All sources $1,795,355.49.

Q. Now take the state?

A. State, $173,069.45.

Q. Now interstate?

A. $1,597,230.02.

Q. Now, if the rates which produced the increase in average revenue per ton per mile shown in your January, 1909 statement of 96.1 per cent on state freight and 9.4% on interstate freight had been in effect during the last six months of 1907, I want you to calculate the gross revenue of your freight traffic for that period. Assume now that that increase had been in effect during that period?

A. That is quite an assumption; to assume that that same volume of business and same rate would obtain for any period like six months. Now, is it necessary for me to figure this rate at

2014 this time.

Q. You want a little time to figure it?

A. Yes, sir.

Q. You have all the data necessary to make that?

A. Yes, sir.

Q. Now, I want you to show from that calculation, the increased amount of expense that would have been apportioned to the state traffic under that increase, and the decreased amount apportioned to the interstate traffic under that supposed increase, following the line of your Exhibit #23, except applying these actual figures to that six months,—to what was the illustration there?

A. You want an Exhibit 23, on the basis of that increase.

Q. On the actual figures of your six months, assuming the increase of your January business had obtained during that six months?

A. All right, sir.

Cross-examination.

By Mr. MOORE:

Q. When did the rates that were put in by the railroads, after the injunction granted in these cases, take effect?

A. November 2nd, 1908.

Q. That was the state rates?

A. Yes, sir.

Q. Was the adjustment of the interstate rates made at the same time, or did that come later?

2015 A. I do not understand it was made at the same time; it followed in the course of business.

Q. How long after November 2nd, 1907, did it take to make the readjustment of interstate rates, so as to form them and keep them in harmony with the changes that had been made in the state rates?

A. I am of the impression that it took quite a time to get them all adjusted.

Q. Would the re-adjustment be reflected in the business of the following January?

A. I think not, sir.

Q. What effect would that have on the value of the comparison that is made on these figures here?

A. My idea is that it would make them very disproportionate.

Q. I believe your statistics in this case, show the average haul of state and interstate business, does it not?

A. Yes, sir.

Q. What is it?

A. You want it for the six months we are discussing?

Q. Yes, sir, I will say for the six months ending December 1907?

A. On state business, 43 miles; interstate business, 232 miles; that refers to freight.

Q. Now, I want you to state, in view of that difference in the length of the haul, between state and interstate business, and of the difference that would naturally exist in the character of commodities involved in state hauls and interstate and trans-state hauls, what, in your judgment, is the value of the comparison ob-

2016 tained in the exhibits we have just been asked for?

A. Since the question has been raised, if there is no objection, I would like to have an opportunity to analize the question and answer it.

Q. You prefer to answer it later?

A. I would.

Witness excused to be recalled.

2017 G. W. SWAIM, being first duly sworn and examined, on behalf of the defendants, deposed as follows:

Direct examination.

By Mr. HILL:

Q. State your name, age, residence and occupation?

A. G. W. Swaim, 36 years old, I live here in Little Rock; I am rate clerk of the Railroad Commission.

Q. How long have you been rate clerk of the Arkansas Railroad Commission?

A. Since May, 1904.

Q. During that period of time, have you made a study of the rates prevailing in Arkansas, state and interstate?

A. Yes, sir, I have made somewhat of a study of rates, state rates especially.

Q. Are you familiar with the records of the Arkansas Commission, and of its proceedings, in regard to rate matters?

A. Yes, sir, fairly familiar, I think.

It is agreed, that no objection will be raised to this witness testifying as to the facts which he has obtained from the records; that

he is to give references so that they may be verified, and the records will be held accessible to the plaintiffs at all times.

Q. Mr. Swaim, have you prepared a memorandum of the changes which have been made in the Arkansas intra-state tariffs, since the joint rates were put in effect in 1903?

2018 A. Yes, sir.

Q. I believe 1903 is the correct date when the joint rates were put in effect?

A. Yes, sir, July, 1903.

Q. I wish you would commence with the changes that were made then and follow it up with all changes that were made in the tariff all changes that would affect rates from July, 1903, up to the time of the granting of the injunction in this case, September, 1908?

A. I have made a compilation in this form; I will give you the headings; the article and the reference to the amendment of the tariff or classification, where the change is found; the next column is under the head of remarks; I show what the change was from and what it was to, and the next column is the date effective of the change, and the basis that I used to determine the amount of the change, the extent of the change, figuring the rates for 25, 50, 75, 100 and 200 miles, at both the old rate and the rate to which it was changed, and I take the totals of those rates for those distances and from these totals, I figure the percentage of the reduction; I believe they are all reductions more or less. Which statement is as follows, and is made a part hereof as exhibit "B." For Exhibit "B," see Volume 9, page 5762.

Q. The first item I see in your statement, is L. C. L. rate on bagging and ties, which amounts to a reduction of 39% on that rate, calculated as you have explained; I will ask you if you know

2019 the extent of the movement of that commodity, under this rate?

A. No, sir, I do not.

Q. Have you any data by which you could make an estimate of the extent of that movement?

A. No, sir, not so as to give you a figure, but I can give some data that will throw some little light on it.

Q. Give us that.

A. The railroads in their reports to the Commission, make what they call a tonnage statement, uniform in all the reports, and they report the tonnage under the following general headings: Products of Agriculture, animals, mines, forest, manufactures, merchandise and miscellaneous; in Products of Agriculture they include grain, flour, hay, tobacco, cotton, fruit and vegetables and other products, and Products of Manufacture; they include petroleum, and other oils, sugar, naval stores, iron, pig and bloom, iron and steel rails, other castings, and machinery, bar and sheet metal, cement, brick and lime; agricultural implements, wagons, carriages, etc.; wines liquors, household goods and furniture; now, they are drawn out that fine; they are classified into that many classifications; on this report, there is no item which covers bagging and ties; I suppose it

is included, on account of its insignificance, with merchandise shipments; I will give you the percentages of merchandise.

Q. This is an L. C. L. movement; do you know what the percentage of L. C. L. intra-state movement is to the entire movement?

2020 A. No, sir, I do not; I have heard it variously estimated. I think it is a very small part of the carload.

(Mr. Johnson, do you remember the statistics of your road, as to the percentage of the L. C. L. movement?

A. Yes, I remember it for one month, October, 1907, which I consider a fairly representative month, of the total movement, and it is 4½%, but I do not know that it is an exact apportionment between carload and less than carload.)

Q. Mr. Swaim, assuming that the L. C. L. movement is approximately 4½% of the total movement of the state, I will ask you if you could make any estimate of what proportion of that 4½% bagging and ties movement would be?

A. I have a report here for the Iron Mountain, for the years of 1908 and 1909, and for the Cotton Belt for the same years; these are percentages that I am dealing here in; the heading for 1908 report for the Iron Mountain is State of Arkansas estimated; 1909, is Arkansas intra-state; the Cotton Belt 1908 heading reads "Arkansas interstate and intra-state" and the same heading for the year 1909; now, the merchandise——

Mr. MOORE:

Q. What are you reading from?

A. I am reading from memoranda I made from the reports.

Q. Where did you get those headings you read?

A. They were taken from the headings as made in the report, quoted; we have those reports; I didn't bring them over, but they are accessible; I just took off the percentage because we could

2021 deal with anything but percentages; the merchandise part of this traffic for the Iron Mountain is 17 per cent for one year, and the other year is 16 per cent.

Q. What are you speaking of now, the percentage of what?

A. The percentage of the total traffic, which is assigned to merchandise shipments.

Examination resumed by Mr. HILL:

Q. That is both state and interstate?

A. Yes, sir.

Q. Do you think that same proportion would hold good as to intrastate business?

A. It shows here on the Iron Mountain—it says "State of Arkansas;" it does not say intra-state; the next year it says "intrastate;" one year is 16 and the other, it is 16.19.

Q. Take it that the merchandise is about 17% of the entire traffic, and that is not divided into carloads and L. C. L.

A. No, sir, that includes both.

Q. Would there be any difference, in your opinion, as to the movement carload and L. C. L., as to this particular item of bagging and ties?

A. I do not understand that question.

Q. Would the same proportion hold good as to carload and L. C. L. movement of bagging and ties, or would it be different?

A. I think it would hold good.

Q. We have then, an estimate that all mercandise is 17% of the total traffic, and that proportion would hold good in carloads and L. C. L., and that reduces your estimate to this, that the L. C. L. movement is 4½ per cent of the whole, and of that 4½%, 17 per cent is merchandise, is that right?

2022

A. Yes.

Q. Now, what percentage of the merchandise would bagging and ties be?

A. I was going to get it down just as far as I could, and then guess at it; it is not appreciable, but it is some small fraction of the 4½% of the 17% ; it is too small to equal any percentage at all.

Q. At any rate this movement, from the data you have and your knowledge, is very insignificant, comparatively speaking.

A. Yes, sir.

Q. Take your next, cotton seed, cotton seed meal, and cotton hulls; there seems to have been a change in that of 26%; that is L. C. L. movement; what is the extent of that?

A. That would be included under the head of products of agriculture, and that runs from about 12% up to 17%, and of course, that includes such items as grain, flour, hay, cotton and other products, and necessarily, this would be a very insignificant movement.

Q. Wooden cross arms is the next change I find; there is a change of 49% on that, another L. C. L.

A. That would be very little; there is some little movement but it is very small.

2023

Q. They have coined a word in this hearing—"a negligible quantity," would that describe that?

Mr. MOORE: I think you had better educate him a little, you and I haven't been able to comprehend it fully yet.

Q. How about infinitesimal; this would rather come in the classification of infinitesimal?

A. Yes, sir.

Q. The next item is fire brick; change in carload rate of 28%, and change in L. C. L. rate of 29%; state what you know, if anything, about the extent of the movement of that?

A. I don't have any special knowledge about the extent of any of these movements, but I am sure, from my general experience, that it could not be much; it is not used much; shipments are very light.

Q. That is usually a few stray cars here and there?

A. Yes, sir, it moves sometime in L. C. L., where a man wants to build a chimney back, or something like that; I guess they keep it in small quantities in little towns.

Q. There are a few occasional movements?
A. Yes, sir.
Q. The next item is wagons, farm and logging?
A. Yes, sir.
Q. There is a change on the carload rate, of 30%, and L. C. L. rate of 25%?
2024 A. We have here in the Cotton Belt report for 1908, under this head, including wagons, carriages, tools, etc., they make a report here that it is .92 of 1%.
Q. Of the whole movement?
A. Yes, sir
Q. What is included in that?
A. Wagons, carriages, tools, etc.
Q. That is, farm wagons, and farm and log wagons, would be only a small proportion of that classification?
A. I don't think it would include any large part of it.
Q. The whole business is less than 1%?
A. Yes, sir, about .9 of 1%.
Q. The next rate change is cider, ginger ale, and pop soda, and mineral springs water; that seems to have been changed to class "C"?
A. Commodity rate.
Q. What was the effect of that change?
A. Of course, there is a right smart movement of that, but that case goods, I think, moves largely by express; cider in barrels, there would not be much of that.
Q. You don't give any percentage on that?
A. No, sir, and I don't see anything here on that.
Q. In this total, you don't give the percentage of change of that rate?
A. No, sir; that was changed from class "D" to commodity rate; I will complete that.
Q. You think most of that stuff moves by express?
A. Yes, sir, that case goods, I am satisfied, it does.
2025 Q. Here is a matter that don't seem to be a rate, but it is changed; agricultural implements, stop allowed in transit for $5. charge?
A. Yes, sir, we followed an interstate arrangement; it does not change the revenue but gives the shipper better advantages, so he can ship a car to two or three destinations, instead of one.
Q. And they put a charge on that of $5. to the Railroad Company, to cover that privilege?
A. Yes, sir.
Q. The next item I see is plow points?
A. That is what that item is, plow parts, or points, etc.
Q. Is that L. C. L.?
A. Yes, sir.
Q. There is a change of 13% in that? Do you think that change would be of any moment?
A. No, sir; there is nothing here in these items, even a small item,

that would even include that; the nearest to it is bar and sheet metal, and they don't divide that—done far enough.

Q. Would it come under agricultural implements?

A. It may be included there; that is .92 of 1%.

Q. This would be necessarily an extremely small part of that?

A. Yes, sir, this is just plow irons.

Q. The next seems to be canned goods, L. C. L., construes pickles to include catsup, and horse radish.

A. Those are the only items affected by the reduction.

Q. That was a change in the classification, was it not?

2026 A. It was adding some other items to the canned goods mixtures, putting those items in commodity rating; it was more of an interpretation, whether they were all included under the word "pickles"; there was a question came up about it, and the Commission included it, to settle that; I think there had been some question about it before that.

Q. That was more of a ruling than a change of rates?

A. Yes, sir.

Q. Portable houses, seems to be the next; that was changed to lumber rate, plus 3 cents?

A. Yes, sir; I thought there would be so little of that, I didn't figure it at all; I know there came a demand for the rate; there must have been some movement.

Q. This was knocked-down houses?

A. Yes, sir, houses built at the mills.

Q. The rate was made just for some occasional movement?

A. Yes, sir, camping outfits or something like that.

Q. Hay is the next, may be shipped with flour or grain at the highest rate of any items; not a reduction, but provides for larger mixture.

A. Yes, sir, hay and flour rates were about the same, but they could not be shipped together, and the effect of that was to allow them to be mixed together; of course, it gave a rating on less carload, carload rating on less carload shipments, by making these two items the same; it was of some advantage to the shipper, of course.

Q. That was L. C. L. movement?

A. No, sir, carload; L. C. L. would not have been any dif-

2027 ferent because the rates were about the same.

Q. This amounts to waiving two separate minimums and allowing the car to be loaded, part with flour and part with hay?

A. Yes, sir.

Q. The next I find here is rule in return shipments; I wish you would just explain that?

A. That is just an interpretation of the rule; there is no change there; both sides agreed to that.

Q. Here seems to be another bagging and ties?

A. In the former instance, it was reduced to 2½ times the carload rate, and there it was reduced from 2½ times, down to 1½ times.

Q. That involved a reduction of 40%?

A. Yes, sir.

Q. You have already explained what you know about the extent of that movement?

A. Yes, sir, it is L. C. L. again.

Q. The next is sugar rate?

A. That is a change in the maximum rate from 15 to 13 cents; that did not affect distances not greater than 250 miles; it is change in carload rates for long distances, and did not affect short distances.

Q. There is practically no movement in that, from 250 to 300 miles?

A. No, sir; I don't think there was; it was made to cover some movement anticipated, but I doub't if the shipments in view were ever made.

2028 Q. You could pretty safely say that the state movements of from 250 miles to 300 miles belong to this negligible quantity?

A. I believe so.

Q. The next is mince meat, in carloads; that seems to be reduced 41%, what do you think about the carload movement of mince meat?

A. The provision there was to allow mixing of mince meat into carloads of canned goods; of course, some shipping was done under it, but it seems another one of that kind of quantity.

Q. It was just a rule, permitting cars to be loaded——

A. Permitting mince meat to be loaded with other kinds of canned goods, already mixed.

Q. That is a change on the L. C. L. rate?

A. Of course, that was changed from class rate to L. C. L. canned goods rate.

Q. Is that a movement of any extent?

A. No, sir; of course my idea about a good many of these things is no better than or not as good as some of the business men would be: I am just testifying about my idea of it.

Q. You have been in close touch with shipping interests of the state for the last six or eight years?

A. Yes, sir, for ten years.

Q. Here is a three mile rate, I wish you would explain that?

A. That was a rate of 1¢ per hundred pounds, maximum charge of $5. per car, made to cover shipments not included under

2029 switching rules, and where the distance was not greater than three miles; before that ruling was made, the 5 mile rate per hundred pounds ran to 2, 3, and 4 cents a mile, and the minimum was about 30,000 pounds; it did not include very many shipments, because the switching rate is less than that.

Q. This would apply where the switching rate did not extent three miles and where the movement was three miles and under five?

A. Yes, sir.

Q. That was to make a rate for three mile movement?

A. Yes, sir, it was five mile minimum movement before.

Q. The next item I find is concrete building material, carload

lots, change of 66%; have you any data to give an approximation of the extent of that movement?

A. No, sir, I have not; it shows here, stone and sand and other like articles; the only percent I found was that which included stone and sand movement, for one year, which was .8 of 1%; for the other year, it was just 1% of the total traffic; of course, that is an inappreciable part of that movement.

Q. Concrete building would be an inappreciable part of that classification?

A. Yes, sir.

Q. It altogether amounts to about 1%?

A. Yes, sir.

Q. Vinegar and cidar seems to be the next change, added to the vegetable mixture?

A. Of course, that permitted sometimes the movement of
2030 a barrel of vinegar or a barrel of cider along at a little cheaper rate, but in the very nature of the commodity, it could not have been changed much.

Q. The next item is machinery to be repaired, and there is a change of 35% on that; do you know anything of the frequency of that movement?

A. No, sir, of course, that is where machinery is to be shipped in for repairs, and for a long time, it was covered by special rates, but it got so after awhile, that they were more careful about special rates, and it made a demand for this rate, and it was put it; I don't believe there was a great amount of it; there was some shipping under it.

Q. Have you any data before you, by which the railroads have kept any memorandum of the extent of the movement of that kind?

A. No, sir; they put everything under the head of machinery and the movement under that head was .61 of 1% of the Cotton Belt, in 1908, and .59 of 1% in 1909. I don't know whether that would include that tonnage or not; you will see how small is the percent of the whole class it comprises.

2031 Q. The next movement I see is L. C. L. on machinery. What is that?

A. That was the third-class rating put in on saw-mills, put in by the railroads and approved by the commissions. It reduced the rate from first-class to third-class.

Q. So that was a voluntary change?

A. Yes. It was just merely approved by the commission.

Q. And there was no action taken by the commission making that change?

A. No, sir.

Q. Other than their approval of the railroads in doing so voluntarily?

A. Yes, sir.

Q. Millet seed per car-load and millet seed L. C. L. seems to have been the next change.

A. That is a change that was effected on millet seed and that like.

It amounted to a considerable reduction, though I don't think the movement was much; that is, there was not much movement of it.

Q. The next is iron grates. Were there any movements to any extent under that?

A. That had special reference to heavy grates and they were only shipped to saw-mills out in the country and other industries etc.

Q. There is alfalfa, broom-corn, clover, etc. per carload lots and L. C. L. on which the rate seems to have been changed. Have you any idea od that?

A. No, sir. I know it couldn't be much. I don't think we
2032 have much to do with them.

Q. The next is wire nails, wire fencing and some other things there. What do you know in connection with that?

A. Yes, there is considerable change. That is one of the changes that was made on account of the interstate mixture; that was enlarged on account of the interstate mixture. There is nothing here that gives us a fair idea of the amount of the traffic, barring sheet metal, here, take iron and steel rails. Barring sheet metal the whole group was less than one per cent of the traffic for either year.

Q. Is there not a separate head for wire nails?

A. Yes, sir.

Q. But in that grouping made by the railroads does any car bill separately?

A. No, sir.

Q. That is made along with the merchandise?

A. Well, there is no idea you could have to form an opinion of that with advantage. That didn't change the rates on the common articles that generally move under the iron rates.

Q. Now, you refer to conforming to the interstate mixture. What do you mean by that?

A. Well, we have the interstate group of articles with the metal rates, and whenever it is enlarged generally, whether with or without sufficient reason, you generally have reason to conform to it.

2033 Q. So as to make the state mixture the same as interstate?

A. Yes, sir.

Q. Now, here is saw-dust added to cord-wood rate.

A. Well, somebody had a shipment of saw-dust they wanted to ship, and would ship if they could get cord-wood rate. I don't know the origin of it.

Q. The saw-dust movement is not very heavy in this state?

A. No, sir.

Q. Here is rice products, and rice hulls, added to corn mixture, what do you know of that?

A. I don't know, Judge Hill, I don't believe it has been changed; I never have seen any of it in the markets; I guess it could have been.

Q. There is not but one rice mill in the state, is there?

A. Yes, three or four, but they are not shipping much.

Q. Now, the next is wheel-barrows carload, 16% change.

A. I doubt if that rate was ever effective for more than five cars; it was effective at Ft. Smith, and one at Hartman.

Q. Here is sawed and bent shapes for agricultural implements, change of 23½% on that rate per carload, do you know anything of the extent of that, why it was made?

A. No, sir, I know less about that than of the others, but I don't think it is much.

Q. The next rate is clariforce and Mexiota?

A. That was made to include some new brands.

Q. Adding some new brands to an already existing similar
2034 class, I presume?

A. Yes, sir, they were not provided for, and they didn't have any rate, so they made one.

Q. The next is the minimum charge, the rule was changed, what was that change?

A. The minimum charge is, of course, the minimum amount for which a shipment can be shipped; before that rule was made it was 25 cents for each line that participated in the haul; after that rule was made, it was 25 cents for one line, 40 cents for 2 lines and 60 cents for three lines, just a slight reduction. A good many shipments move but not many joint shipments; for a single line, it was not changed at all.

Q. This was just making application of that rule for the joint line movement?

A. Yes, sir, but reducing the minimum, where there was more than one line participating.

Q. Would that apply to the Cotton Belt Road?

A. There is no way to get at that.

Q. Well it is already in the evidence that that movement is a negligible quantity. Handles—car loads deduction of 2¢. Do you know anything of that?

A. Scarcely anything of that.

Q. The next change is Dowell-pins goven on the lumber rates plus 5¢. Do you know what a Dowell-pin is?

A. I have found out today.

Q. Tell us?

A. It is a pin used to fasten different parts of the barrel
2035 tops together. They fit in the holes and fasten them together. I reckon there must have been some movement or the rate wouldn't have been put in, but I can't conceive of a car load.

Q. The next is mining cars added to farm wagon rates. What do you know of that?

A. I don't know there couldn't be any shipment except in the western part of the State.

Q. Well that is just adding mining cars to farm wagon rates?

A. Yes, sir.

Q. The next change is plow handles—shallack?

A. Yes, we didn't make any difference in the rate. The shippers would quarrel with the agents, some would apply the rating and some wouldn't, and they just made the rule so the agents would all give the rate.

Q. Now the next movement is, I believe, of more importance; coal and coke and slack movement—there seems to have been a change of about 6%—no 11%—no 6% is right. I wish you would explain that coal rate?

A. The principal change in the coal was in November 1906, They changed the single line rates for two or three distances only, and they were not negligible distances. They were distances that made some differences in the rates, so the percent that is figured there is no more than fair.

Q. About 6%?

A. That is, on the coal itself, 6%. But on the slack it is 11%. Now that is the change in the single line rates, and at the same time the commission adopted a rule to cover railroads who applied
2036 single mile mileage in their rule. I figured the result of that for a distance of 200 and 250 miles, the distance I thought it ought to be figured to give the rule effect, and on coal it was 12, 10, and 8. For slack it was 10, 15, and 11 per cent.

Q. Was not that coal rate made on conference between railroads and shippers and practically agreed upon by all parties?

A. No, sir, there were a good many diverse interests, I think appeared in the hearing of it, but I think you cannot quite say that on the face of it any railroad advocated the change. Some of them didn't enforce it after it was made.

Q. I believe as a matter of fact some wanted it and some didn't?

A. I think if you go behind the record that is the opinion; that it had something to do with the action of the commission at the time.

Mr. KIRBY:

—. Did you go behind it to see?

A. No, but the railroad Company, as they generally do, stuck together.

Mr. HILL:

Q. Does that cover materially changes, you have explained?

A. Yes, sir.

Q. Now the oil car load rates, and the oil L. C. L. was changed. I believe that was one of the largest changes made?

A. Yes, that was changed back and forth, and the final change since they first adopted has amounted to about one half per-
2037 cent.

Q. Now have you any data from which to ascertain the state of the oil movement?

A. Only from the Cotton Belt report for the last two years. One year it was .93 of 1% and the other year 1.93 of 1%.

Q. Since you have been connected with the commission, what is the change that has affected the rates so far as you know. I mean the revenue appropriations?

A. I have not thought about that question at all.

Q. Now on excelsior is the next change. I see here a change of 19%. That seems to be a change only in certain distances in the excelsior rate?

A. Yes, sir, that is not a negligible quantity though, because it

was made in reference to a movement that it was thought that it would produce. I don't know whether it ever did or not. There was just one plant and if it did it couldn't have been more than a car load of it ever moved at all.

Q. The next change seems to be certain articles added to the iron list; angle-bars, hoops, and various other items that were added to the iron list. You have it all marked here on account of interstate mixture. Explain that?

A. It was another one of those same instances where they just made the commission tariff conform to the interstate tariff on the the same goods.

Q. Now the next change is on rough rice. I don't know whether it is changed or not. I believe it is a new rate, is it not?

2038 A. Yes, sir, made on account of the movement of rice from the mills. I think Rock Island expected the most movement over their road. I think the Cotton Belt have about the same rate. That is reduced from the commercial rice rate.

Q. That was made just to meet a new industry that has just recently sprung up?

A. Yes, sir.

Q. Did you have that rough material rate?

A. No, sir, the best that was in effect under the Commission's tariff was the same as the Iron Mountain tariff. The Cotton Belt rate was made, in some instances, higher, but the Commission never did consider that change at all.

Q. You did not find any record of it?

A. No, sir; it just came up this way. The Iron Mountain had been for a long time protecting the rough rice rate with a special tariff they published themselves, and the- neglected to withdraw that tariff. That is how the issue was made between the Commission and the railroads and when the other railroads joined it made considerable splash, but the Commission never made any rate at all.

Q. That was to enforce the Iron Mountain Railroad?

A. Yes, sir.

Q. Well, now, these changes and additions that you have gone over comprise all actions of the Railroad Commission from

2039 July, 1903, to September, 1908, so far as the intra-state rates are concerned?

A. I think they are. I went carefully over it and made a note, and copied it as I have the ability to do it.

Q. You have gone over this carefully and made it up the best you could?

A. Yes, sir.

Q. What difference, if any, was there between Standard Distance Tariff #2 and Standard Distance Tariff #3? I don't want you to go into detail, but state generally what difference there was.

A. Tariff #3 was not issued to embody any new rates at all.

Q. It just embraces the amendments up to the date of its issue?

A. Yes, sir.

Q. And are these the amendments you have referred to in your testimony here?

A. Yes, sir.

Q. And are all that were included up to the time of the issue of Tariff #3?

A. Yes, sir.

Cross examination.

By Mr. MOORE:

Q. Mr. Swaim, in what business were you engaged before you became connected with the Railroad Commission?

A. I was in the railroad freight offices.

2040 Q. Where?

A. I came immediately from Mr. Bragg's office—the Freight Bureau—to the Commission. Prior to that I was with the Cotton Belt a few months; and I went to the Iron Mountain Division Freight office in 1898. I was there about five years.

Q. You were never engaged in business on your own account were you?

A. Not very much.

Q. What opportunities have you enjoyed of knowing the movements of the different kinds of commodities and classes of freight throughout this state?

A. No more than I would glean in this business that I have just referred to.

Q. Well, to what extent would that give you the opportunity of informing yourself on that subject?

A. Well, I don't think the opportunity is excessive. I am not as well qualified to answer some of the questions I have attempted to answer as a merchant would be who was directly in the business, but I have an idea.

Q. For instance, you never have been engaged in the mill business?

A. No, sir.

Q. On what basis do you estimate your means of knowing?

A. Just the conception I have of it and what I have heard.

Q. Well, you would have about the same conception if you lived in St. Louis, would you not?

2041 A. Well, I believe I would have a little better.

Q. What additional means of knowing these things have you in living here from a man living in Memphis?

A. Well, just living here.

Q. Have you paid any particular attention to the movement of mill products?

A. No, sir, not any more than my general observation.

Q. Now, I have lived here a good many years, probably, more than you. I hardly think I could. Now, what particular advantages have you over me?

A. Not much. There might be a little bit, but not much. You might testify as well as I.

Q. Your testimony then is somewhat of a guess?

A. Yes, sir, somewhat.

Q. Have you ever been a farmer?

A. Not since I was a boy.

Q. What is your source of information as to the movement of plow handles in this state?

A. Well, I worked in a store as a boy and around plows, and this business I have worked in for the last 12 years is all the basis I have for the guess.

Q. Is it not a fact that it is very largely a guess, to use the word you used just now?

A. A good deal of a guess. I answered just as I would have answered any question.

Q. How many commodities and classes of freight do the changes to which you testified affect,—the changes that were made
2042 by the Commission?

A. How many?

Q. Yes.

A. I would have to count them.

Q. Well, I wish you would count them.

Mr. HILL:

Q. Did you ask the total changes or just the number of changes on rates?

Mr. MOORE:

Q. The total number of changes affecting rates. Have you finished counting them?

A. Yes, sir; according to the best addition I can give. I have counted some things as changes where they are just rules. There are 75.

Q. Between what periods of time were those changes made?

A. Well, the last was made in April, 1908, and the first in June, 1904.

Q. How many of those changes produced increases in rates?

A. I don't believe any of them increased it. I don't see any increases.

Q. So all the changes made during that period resulted in diminishing the rates, did they?

A. Yes, sir.

Q. You have testified, in fact, as to a great many of the articles that are made the subject of changes, that the movement is very small. What is the object of the Commission in changing the rates affecting movements of so little importance as your testimony shows them to be?

2043 A. A great many times a very small matter will bring up a demand for a change in a rate or some particular item. May be it is a movement between two points, and the policy of the commission is to only change a rate that will embrace an article in the joint distance tariff. And I think the most of these changes were just in answer to a demand for some movement intrastate.

Q. A demand from whom?

A. From shippers. Most of these, fairly all of them, were made on the demand of shippers.

Q. How many demands were made for changes during that four years' period covered by your exhibit?

A. Why, in just practically all cases. I don't know of the Commission ever making a change only upon complaint.

Q. Exhibit "B" then covers practically all demands for changes during that period?

A. I thought you meant how many demands as to those changes. No, there were other demands that were not granted.

Q. How many?

A. I don't know, but we have some data compiled on that.

Q. Well, state approximately,—if you have it.

A. I wouldn't like to guess at it, because in a little while I could go and get many of the instances, a considerable number.

Q. Well, I want to call your attention to an item. For instance, take saw-dust. How came that change to be made?

2044 A. A man had some saw-dust and had an opportunity to sell it at some certain point. There was a class rate—I forget the particular instance—but there was never any movement before that and a class rate applied. The reason for the absence of the rate was there never had been any movement. And as soon as he applied for the cord-wood rate—He said it would be used as cord-wood would be used, to burn—But of course the cord-wood rate was prohibitive. There was no rate because there was no movement and the rate was made.

Q. I believe you testified as to the change of the rate on sugar. I believe you said that affected a haul of 250 miles?

A. Yes, about that.

Q. What did you say as to the extent of the movement of sugar on hauls of that length in this state?

A. I said I didn't think there had been very much of it.

Q. On whose application was that change made? At whose instance was that change made?

A. I can't tell you the name of the party.

Q. Will your records show?

A. I think they will.

Q. Well, I want you to look that up. Now, what was the object of the commission making that change?

A. Well, their object was to reduce that maximum rate to 13 cents. They thought it ought not to be higher than that.

Q. Why was it necessary to reduce that maximum rate?

2045 A. My recollection is it was thought it would affect the movement from Helena to Little Rock or to Texarkana and they thought the state rate was too high.

Q. Was the movement from Helena to Little Rock embraced in that? Is that the distance?

A. Yes, sir.

Q. 305 miles?

A. Well, that couldn't affect that.

Q. Yes, but you misunderstood me. You say it is 305 miles from Helena to Little Rock?

A. Yes, by that road.

Q. By what road?

A. By the Iron Mountain .

Q. How much sugar is sold and distributed from Helena and Little Rock in the course of a year?

A. Why, I don't reckon there is any.

Q. How much is there shipped from Helena, originating at Helena, to the distance of Little Rock in the course of a year?

A. There would be very little of that.

Q. Well, would there be any? Do any of the Little Rock merchants buy sugar at Helena?

A. No, sir.

Q. There is no movement any way then between Helena and Little Rock?

A. No, sir.

Q. Well, then, that illustration doesn't apply, does it?

A. No, I said Helena to Texarkana.

2046 Q. Do the Texarkana merchants purchase sugar at Helena?

A. I don't know. That is the rate.

Q. Now, don't you know, as a matter of fact, that there is no interchange in the way of buying and selling between Helena, Little Rock and Texarkana, or any jobbing point of Arkansas,—between them and Helena?

A. Yes, I think that was why it was made.

Q. You think then that rate was put in for the purpose of promoting the jobbing interests of Helena by creating a market at other jobbing points in Arkansas, by which the merchants at other jobbing points in Arkansas would buy from Helena. Is that the object of it?

A. No, sir. They stated they wanted to ship sugar from Helena to Texarkana.

Q. Who stated that?

A. Whoever it was. I forget.

Q. Where did that sugar come from they wanted to ship?

A. I guess from where it all comes from.

Q. Where?

A. From Louisiana.

Q. Wasn't that rate made for the purpose of influencing the interstate rate on sugar?

A. No, sir.

Q. You say it was not made for that purpose?

A. No, sir. I can't answer that question any other way.

Q. Now, what was the object, assuming there was no trade between Helena and any other jobbing point, you have referred to Little Rock, Texarkana and other points—assuming there

2047 was no trade between those points and Helena was not an originative point for the purchase of sugar by the merchants of this state, what could have been the object?

A. I would say this, to promote trade between these two points. You can't go clear back, Colonel. Of course sugar that comes from Helena comes from somewhere else. They don't raise any at

Helena. Nearly all the sugar marketed in Arkansas comes from Louisiana.

Q. Was that application made by the people of Helena or Texarkana?

A. I can't remember. I remember the circumstances.

Q. Can you remember whether the application for that reduction was made by the merchants and shippers of Helena for the purpose of building up a jobbing trade from that point?

A. I don't think it was. I think it was Texarkana interests.

Q. Don't you know the Texarkana interests, either before or after that order was made, purchase their sugar at Helena?

A. I don't know what the effect was.

Q. Speaking on the same basis, speaking from your impressions, as you have testified very largely in regard to other matters since you went on the stand this morning, from your general knowledge and views as a citizen of the state, what would be your opinion about that, as to whether there has been any trade between Helena
2048 and Texarkana in sugar, either before or after that order?

A. I don't think there is. I doubt it. I might miss it a little on that, but I doubt it.

Q. Now, I will ask you if it is not known to the members of the Commission and to yourself and to those that are familiar with traffic arrangements that that cut in the rate on sugar would affect the interstate rates under the rule that prevails, when the interstate rate is made up of a combination of locals: that is, local rates?

A. I would answer for myself. I wouldn't answer for the impression the Commission has acted under.

Q. Well, just answer from the common knowledge of everybody connected with that subject.

A. I am satisfied that they knew what the interstate rate was New Orleans to Texarkana and what it was from New Orleans to Helena.

Q. But, is it not true that, in a general way, the interstate rate was made up of a combination of locals—local rates, and to that extent influenced by the local intrastate rates?

A. It might in that instance. I forget just the details.

Q. I am not asking you for details. I am asking if the general rule applied to interstate rates, whether they were not as a rule made upon a basis of a combination of local rates within the states.

A. They look like it sometimes, but I don't think that is the basis for making the interstate rates.

2049 Q. Well, wouldn't that necessarily be the maximum rate?

A. Oh yes, it would be the maximum rate.

Q. During your long connection with the State Commission you have endeavored, have you not, to familiarize yourself with the rulings of the Interstate Commerce Commission in so far as they may affect state rates? Have you not?

A. Yes, sir.

Q. Well, you are aware, are you not, that the Interstate Commerce Commission have adopted a rule by which the through rate

should not exceed the sum of the local rates of freight hauled, but retain its prima facie reasonable rates?

A. Yes, it amounts to that.

Q. Now, in view of that rule of action governing the Interstate Commerce Commission, is it not a fact that the local rates do affect the interstate rates?

A. Why, yes, they do.

Q. Then we have a case now in which an interstate rate applies upon sugar for a distance this sugar does not move in the state. There is no traffic in it covering this distance. And there is a material reduction made in it. All the trade at that time was between other points and was constituted of interstate shipments. Now, in view of these facts, I want you to state if that was not made for the purpose, obviously, of affecting the interstate rates, and if that was not the purpose of the man who made the application for the change?

2050 A. I think it was made to get a cheaper rate. I don't think the Commission made the rate in order to influence interstate rates, but the application was made to get a cheaper rate on sugar.

Q. I believe you said that application came from Texarkana.

A. I said I thought it did.

Q. And the object of making the application was to get a cheaper rate on sugar?

A. Yes, I think so.

Q. And the merchants down there purchase their sugar from New Orleans and Mobile; that is, Louisiana points?

A. Yes, I think so.

Q. What is the extent of that change? What is the amount of the change? What was the rate before?

A. 15 cents.

Q. And reduced to 13. What is the rate between New Orleans and Helena?

A. I have forgotten. I didn't take any record of the interstate rates at all and it has been several years ago and I don't remember anything except the change that was made on the state rate.

Q. Well, at that same hearing, wasn't the railroads represented at the time that change was made?

A. Yes, I think so. Oh yes, I know they were.

Q. Didn't the railroads furnish the commission with information as to the rates from New Orleans and other points from which

2051 the merchants who were making the application obtained their sugar?

A. Yes, I am sure they did.

Q. Well, if they did and the rate from Helena to Memphis was 10 cents and the rate from Memphis to Texarkana was 13 cents, they had that information, didn't they?

A. Yes, I said so a while ago.

Q. And they were also informed of the through rate from New Orleans to Texarkana?

A. Undoubtedly.

Q. Do you know what that was?

A. No, sir.

Q. While ago you said that the distance from Helena to Little Rock was about 320 miles. I will get you to take this time-card here and see if it is not 160.

A. I said Texarkana.

Q. You didn't mean to say it was 320 miles from Texarkana to Little Rock?

A. No, sir, it is 160 to Little Rock.

Q. Now, is there any intrastate shipment that covers a distance of 250 miles of sugar in the State of Arkansas?

A. Why, yes, if the shipment moved from Helena to Texarkana it would apply to that.

Q. Well, do intrastate shipments move from Helena to Texarkana?

A. I don't know. I might guess.

Q. I am not asking you to guess. I would prefer facts.

2052 A. I wouldn't think they did, but I wouldn't have any reason to say they didn't. I doubt whether they would or not under ordinary conditions, but they might.

Q. Any other shipments?

A. Let's see. Shipments from Texarkana to the north end of the Iron Mountain. What is that town? Moark. Of course that would.

Q. That is to say, from Texarkana to Moark. Now, is there any shipment of sugar made from Texarkana to Moark?

A. No, sir, not that I know of.

Q. What is your object in making that statement then?

A. I thought you wanted to get at the distance.

Q. Well, that doesn't have any bearing on this proposition. The effect of this then was to reduce interstate rates from Louisiana points to Texarkana. Now, what effect would it have on the rates from Louisiana points to Fort Smith?

A. I didn't say that.

Q. You didn't say what?

A. That the effect was to reduce the interstate rate. It might have been reduced but I don't think that was the effect.

Q. Well, give us your best judgment?

A. I think the interstate rates bear some relation, in some way affect state rates, but I don't think it is as much as is lots of times asserted.

Q. Well, give us your best judgment as to the effect that a reduction of the rate on sugar in this state, that you have shown
2053 as an exhibit, had on the interstate rates from so many Louisiana points to points in this state?

A. Do you mean my judgment of what would be the effect of reducing that rate two cents?

Q. Yes.

A. Well, if the interstate rate were so adjusted that it reduced the through rate it would eventually reduce others. No question about that. Whether it did I can't say.

Q. And if it did that it would do so?

A. Generally. But how much it would take to do that I can't say. Of course, it would reduce it sufficiently after a while.

Q. What was the change in the hay?

A. The hay rate was not appreciably reduced. It was just simply an action there allowing them to ship hay and flour together. Prior to that time the rate on either commodity was about the same, but they couldn't be mixed. And in that way you could ship less than carload shipments.

Q. You mean it could be shipped in the same car in carload movements?

A. Yes, sir.

Q. Why?

A. Because the classification would permit the mixing of them.

Q. What are applied to hay and what to flour—commodity
2054 or class rates?

A. Commodity on both of them prior to that time.

Q. You said a moment ago there was no appreciable change made in the rate on hay. What change was made?

A. Just simply to allow it to load mixed. It was shipped out at the same rates, but in smaller quantities. Before you would have to have had a carload of each. Under the latter you applied the L. C. L.

Q. Don't you know the result of that rule was to force the railroads to carry hay in less than carload lots at carload rates?

A. Yes, sir.

Q. Now, what is the difference between carloads and less than carload lots on hay?

A. Well, there is a considerable difference.

Q. Just state in figures what the difference was. Give each rate. The rate on carloads and less than carloads on hay.

A. Well, it was this way——

Q. Well, answer my question.

A. Can I make this other statement——

Q. Well, answer my question and then do so.

A. Well, what I wanted to say was—for fear I had overlooked that—If they had not made the change they would have continued to ship each commodity in carloads. Sometimes it might have been inconvenient to ship, but they would have continued to ship each in carloads.

2055 Q. Now, I understand that. You mean to say that when they shipped a car load of hay they charged carload rates and when they shipped a carload of flour they charged the carload rate applicable to flour,——

A. Yes, sir.

Q. But, under this rule, if they put the two into one car, that, under the carload movement, they had to apply to that the carload rate?

A. Yes, sir.

Q. Now, give me the difference in the rates,——

A. But what I said further was that, for instance, if they had not made the rate both commodities would have moved in carloads and at the same rate as they did mixed. Now, you take 50 miles,——

Q. Just figure it out on the basis that you got your average in this exhibit you filed.

A. Well, take 25 miles,—the carload rate on flour is 6 and on hay it is 4; the L. C. L. rate for the same distance is 12 on flour and 10 on hay; 50 miles——

Q. I just want you to state the rate on hay in carload movements and on less than carload lots.

Mr. HILL:

Q. For what distance.

Mr. MOORE:

Q. Just the same as in that exhibit. I think he took four distances and made the average.

2056 Q. Are you acquainted with the location geographically of the different railroads of the State?

A. Yes, sir, in a very general way; I have been out over the State a great deal.

Q. Isn't it necessary for the Railroad Commission, of which I believe you are secretary, to become familiar with the location of the different roads?

A. The commissioners do travel a good deal.

Q. You acquired that information from the maps, I suppose, more than from travelling; do you know it from the maps of the roads?

A. Yes, sir, I think fairly well.

Q. Is there any line of road in this state that has, within the limits of the state, a continuous straight mileage of 300 miles?

A. Yes, sir.

Q. What road is that?

A. There was a distance over this line that we referred to, from Helena to Texarkana.

Q. What continuous line of road extends from Helena to Texarkana?

A. The Iron Mountain.

Q. In what way?

A. Around by Wynne and Little Rock.

Q. What is the most direct route from Helena to Texarkana?

2057 A. It is 305 miles.

Q. What is the most direct route, in view of the various railroads that are between the two places? I take it, it would be the Cotton Belt and Iron Mountain, wouldn't it?

A. Yes, sir; I don't know without figuring; it is not very much difference, I would not think, either way.

Q. What other road is there that has a continuous mileage in one direction of 300 miles?

A. It is nearly that far across the State from the Southwest to the northeast, on the Iron Mountain; that is 300 I believe, and a little more, and then it is 300 miles up to Fort Smith from Texarkana, and 300 miles from Fort Smith around to a good many points south.

Q. What is the distance of the Choctaw road across the state?

A. It is about 290 miles.

Q. Those are about the lines that would extend 300 miles?
A. Yes, sir.
Q. I believe you say this sugar rate is 13 cents on distances of 300 miles?
A. Yes, sir.
Q. In the ordinary course of transportation throughout the State, there is only a few lines on which there could be a continuous shipment for that length?
A. Only a few instances.
Q. Now, what would be the joint rate on two or more lines, under your tariff, on a shipment of ten or fifteen or twenty or
2058 twenty-five or forty or fifty miles of sugar, just look at your tariff and see?
You will find the rate on sugar there on page 9.
A. On two line rate?
Q. Yes, two line rate.
A. The differential is five cents on carloads.
Q. Now, turn to the other rates and see what it would be for those distances?
A. For 25 miles, the two line rate is 13 cents.
Q. What is it for 30—it is so on up to 50?
A. Yes, sir.
Q. What is it for ten ?
A. Ten miles is 13 cents.
Q. So the rate is the same on two or three lines, 300 miles; I mean on two lines, ten or fifteen miles up to 50, that it is the same as it is for 300, up to two or three lines?
A. On two lines, yes, sir. The maximum rate for two line shipments is the same; of course, three line shipments are different; on two line shipments, the maximum rate is 13, and the rate for ten miles is 13.
Q. You call that a distance tariff, don't you?
A. Yes, sir, that is the title of it, "Standard Distance Tariff."
Q. I believe you said there was a rule there, providing that agricultural implements, giving the right to the shipper to remove, make one stop and remove from the carload during the journey?
A. Partially unload, yes, sir.
Q. Tell me in a few words, just what that rule is?
A. For instance, you go to ship from here to Hope, a car-
2059 load of agricultural implements; that permits you to unload it,—say you can stop for instance, and unload part of it at Benton, and stop and unload a part at Malvern, and finish unloading at Hope; you get your carload rate.
Q. The railroads are required to charge a carload rate?
A. Yes, sir, to Hope.
Q. What is the difference between the carload rate of agricultural implements and less than carloads?
A. It all takes class rates; take that instance, for 120 miles, using for the basis class "A," and that is about the correct basis, 28 cents for that distance, and the L. C. L., it runs 1st, 2nd and 3rd class——
Q. What is the L. C. L. rate for the same distance?

A. From 40 to 53 cents for the same articles.

Q. That would be from 12 to 23 or 24 cents difference.

A. Yes, sir; there is this difference; if you ship it L. C. L., the L. C. L. rate to Benton, the first point would be from 19 to 24, and to Malvern, a distance of 50 miles, would be from 27 to 52; they wouldn't charge this Hope rate on an L. C. L. shipment in addition to that, but they would charge $5.00 for each stop.

Q. Suppose they stopped at Prescott?

A. The L. C. L. rate would be from 37 to 47, and the carload rate to Hope is 27.

Q. Now, Mr. Swaim, by enabling parties to carry, load and unload in less than carload lots, and applying the carload rate to it, isn't there a very material reduction in rates affected?

2060 A. I doubt it.

Q. Do you doubt that there is a material difference between 28 for instance,——

A. You mean on the movement?

Q. Yes, sir, doesn't it make a very material change in the rates?

A. It makes considerable change in the figures I read, yes, sir.

Q. And so far as loading, and unloading, and so forth is concerned, it is a less than carload movement?

A. Yes, sir.

Q. You spoke about mixtures, I want you to explain to me what you mean by mixtures; you said for instance, that they mixed mince pies or perhaps mince meat with canned goods; explain that to me?

A. The rate before that was done, provided for mixing of nearly all kinds of canned goods, and some other articles and when they enlarged the mixture, they just provided that mince meat should be shipped at the canned goods rate.

Q. What is the effect of that upon the rates?

A. That changed the rate from the class rate to the mixed commodity rate.

Q. Is there a material difference between the class rate and commodity rate?

A. Yes, sir.

Q. By doing that, every article to which a commodity rate is given, that you added to the mixture, that is withdrawn from

2061 class rate and put under commodity rates?

A. Not every one.

Q. Take the case—you may have mentioned a number, but I happened to remember the mince meat, which you said was added to canned goods?

A. Yes, sir.

Q. That had the effect of taking the mince meat out of the class rates and putting it in the commodity rates, where it was shipped in a car with canned goods?

A. Yes, sir.

Q. That illustration runs through all the cases that are affected by that rule?

A. Not all of them; most of them though.

Q. Give me one that was not?

A. The classification was changed on plows, etc.; it was not made a commodity rate, but the classification was changed and the rate reduced somewhat.

Q. Just tell me what the change was on plows?

A. Plows, plow points and so on, was reduced to third class, and formerly it took second class, and some of them third class, some first class.

Q. Did that make a considerable difference in the rates?

A. Yes, sir; you know I figured out the rate percentages.

Q. I know; we will get to that later; I just want you to tell me the difference between the two classes that you mentioned a moment ago.

A. It made a difference of 13% in that item.

Q. That is not what I am asking you; I am asking you the
2062 difference between the rate prescribed for second class and third class, and you said they were changed from second to third?

A. The difference is 13%

Q. As you stated it there?

A. According to the way I figured it.

Q. What is the difference on a haul of five miles?

A. Between the second and third is one cent.

Q. Ten miles?

A. It is 1 cent.

Q. Now, what is the rate on each class, second and third, you say there is 1 cents difference?

A. 15 and 14.

Q. 20 miles?

A. 19 and 17.

Q. 25?

A. 21 and 19.

Q. What is on 40?

A. 27 and 24.

Q. And for 75?

A. 37 and 32; the percentage don't vary very much for class rates.

Q. You stated that bagging and ties were reduced from fourth class to 250 per cent of the carload rate, and then it was reduced again to 150% of the carload rate; now, tell me what was the result of that reduction?

A. The 1st one was 39%; the next one was 40% more.

Q. What was the fourth class rate for, take some representative distance, say fifty miles?

A. The fourth class was 22, and it was changed from 22 to
2063 10½.

Q. Reduced less than one-half?

A. Reduced from 22 to 10½, yes, sir.

Q. Now, take at 100 miles.

A. It was reduced from 32 to 13½.

Q. What would be the rate on canned goods for the same distance?

A. Carload?
Q. 100 miles, yes, sir.
A. 14 cents.
Q. Were you giving me the carload or less than carload?
A. Carload, 14 cents.
Q. Did you give me the carload rate on bagging and ties?
A. No, sir, that was L. C. L., bagging and ties, 13½.
Q. Now, let me see if I understand you, you reduced bagging and ties first, to 250% of the fourth class rate, carload rate?
A. We reduced it from fourth class to 250% of the carload rate.
Q. Tell me what that reduction involved on 100 miles.
A. About 39%.
Q. Just tell me the difference in cents, per hundred weight.
A. For fifty miles?
Q. No, 100 miles.
A. The rate was 32; 250% would make 22½.
Q. And then you reduced it below that, about 150% of the carload rate?
A. Yes, sir.
Q. What would that be?
2064 A. 13½.
Q. You reduced it from 32 to 13½?
A. Yes, sir.
Q. You said awhile ago, from 22½ to 13½, that is what I wanted to get corrected.
A. There were two reductions.
Q. How did you reach—you stated the dimunition in rates that had been made by the Commission, during the period covered by your testimony in percentages, taking one item of per cent, how did you arrive at that?
A. No, sir——
Q. You averaged it and said it was an average of 20% for an illustration, how did you reach that average?
A. You mean on each single article?
Q. Give me your basis?
A. Here is the basis; I took the rates for 25, 50, 75, 100 and 200 miles, added them together and then took the difference from the sums; assuming there is an equal movement for the distances, of course that is the average reduction; of course that won't always be true.
Q. You took those five distances?
A. Yes, sir.
Q. Took the distances and then added them together and divided them by five?
A. No, sir, added them together and took the relation of the sums to each other.
Q. You have been making statements here frequently, of a percentage; you stated that just now, that is what I am asking
2065 about, how did you arrive at that?
A. Just as I stated there, but I took each item, and I figured the rates for those five distances under the old basis and

under the new basis, and then the relation of the sum of those rates to each other; for instance, bagging and ties, the old rates amounted to $1.69; they were reduced so that they amounted to $1.02; that is 61% or 39% less than the original.

Q. As I understand, you took the sum of all the rates for the five different distances mentioned a moment ago, added them together, you then took the sum of the rates after the reduction had been made in the sum given, and stated the per cent of decrease on the basis of the ratio between the total reduced rate and the original rate?

A. Yes, sir, that is true as to each commodity; I haven't made any attempt to see what the reduction was in percentages or in per cent on all commodities taken collectively at all.

Q. You assumed, of course, in doing that, that the movement would be uniform those different distances, didn't you?

A. That assumption is involved, yes, sir.

Q. Can you state that the facts would bear out that assumption?

A. No, sir, I am not expert enough to testify about that, but those are the ordinary distances and about all the figures that I would make, would be based upon that.

2066 Q. If the facts did not sustain the assumption, the result would not be correct would it?

A. No, sir.

Further cross-examination reserved.

Redirect examination.

By Mr. HILL:

Q. In testifying this morning as to your knowledge of these various movements, and the information you have gathered about that, I will ask you if it is not a fact that various shippers came to the commission with their complaints and to discuss rates with the Commission and that you have taken part in those discussions and learned of these various movements, from talking with the men who actually handled the movements?

A. Yes, sir, in the majority of cases I have had something to do with it in the conferences.

Q. You have gathered information about the various movements in the State in that way, haven't you?

A. Yes, sir, whatever I could.

Recross-examination.

By Mr. MOORE:

Q. In adding articles from time to time to these group rates,—that is what mixtures come under?

A. The mixture, of course, is a commodity group.

Q. In adding various articles to commodity groups, the mixtures you speak of, is the commission governed by any rule?

2067 What rule does it follow, if any?

A. They have not any strict rule; if a case comes up, and

some rule is suggested, for instance, the instance we had, the mince meat and canned goods rate, they found out it had been applied on interstate shipments.

Q. Who applied it on interstate shipments?

A. The interstate railroads.

Q. Did the Interstate Commerce Commission approve it on schedules filed with them? Did it become a regulation with the interstate Commerce Commission upon the filing of schedules?

The above question was at the time objected to by the defendants. Question withdrawn.

Q. Is it true, that the State Commission in regulating these commodity groups in intra-state traffic, usually followed the interstate practice?

A. Yes, sir, often enough. I think, to call that the rule; of course, if a case comes up and there is no precedent, they do not refuse to do anything about it because they cannot find a precedent.

Witness excused.

2068 J. E. HAMPTON, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. Will you please state your name, residence and present position?

A. J. E. Hampton, Fordyce, Ark., I am Chairman of the State Tax Commission.

Q. Were you a member of the Arkansas Railroad Commission?

A. Yes, sir.

Q. During what period of time?

A. From January, 1903, until May 18, 1909.

Q. Did you serve as chairman of the Commission during that time?

A. Yes, sir, I did one year, 1907, I believe was the year.

Q. During the years that you were a member of the Railroad Commission, were you familiar with its work?

A. Yes, sir, I was in the office all the while.

Q. Did you attend all the meetings of the Railroad Commission during that period of time?

A. Yes, sir.

Q. Did the railroads, while you were a member of the Commission, any of them, ask you to raise any rates?

A. The Hot Springs Western did; as I remember, several of these short roads did.

Q. Did you do so?

A. Yes; we allowed them to change their local, which was an increase; that is, this was done after we put in joint rates;
2069 there was no request of that kind while we had single line rates.

Q. When was it you put in joint rates?

A. In the summer of 1903, July I believe.

Q. Did the Iron Mountain Railroad or Cotton Belt Railroad ever apply to the Commission while you were a member of it, for a readjustment of any of its rates or all of their rates?

A. No, they did not, and I do not remember now of any request of that kind at all.

Q. They did not file any complaints with you about the injustice of any particular rates or of the rates as a whole?

A. No.

Q. Did either of these roads, the Iron Mountain or Cotton Belt, make any application to the Commission while you were a member of it, for a restoration of the rates, in whole or part, which had been in force prior to the Commission putting in its Standard Distance Tariff?

A. They did not.

Q. Have there been any material changes in the tariff as a whole; by material changes, I mean changes that would materially affect the revenue of the railroad, comparing the changes with the whole revenue, since you have been a member of the Commission.

A. I think not.

Q. Are you familiar with the Commission rates that were put in before you became a member of the Commission?

A. I think not.

Q. Are you familiar with the Commission rates that were put in before you became a member of the Commission?

A. In regard to that other question, when you asked about
2070 the material change, you were not referring to the joint rates?

Q. I was referring to that, but probably we had better clear up that question about the joint rates? Your answer to the question a few moments ago, I understand you to be referring to the distance rates and not to the question of the joint rates?

A. Yes.

Q. I wish you would, in this connection, state the history of the making of the joint rates by the Commission?

A. The Legislature of 1903 gave us authority to make joint rates; previous to that, our predecessors had put in joint rates, but they were enjoined and the joint rates,—the injunction, was sustained, because it was shown that the Commission did not have power to put in joint rates up to that time; after the Legislature gave us authority, we took up the matter with the railroads in the spring, and we finally issued the joint tariffs in the summer of 1903.

Q. Was there any material change between that tariff as issued then, the joint tariff, and the tariff issued by your predecessors, other than the joint rates as issued by your predecessors had been rendered nugatory by an injunction?

A. I don't remember particularly that we put in the joint rates our predecessors had, but it was a revision from what the railroad was using at that time, because they were allowed then to use the sum of the locals.

2071 Q. When you put in the joint rates, upon what basis were they established?

A. Well, we had a hearing before the Commission and the railroad representatives were present, and from the best information we could get, in regard to the rates put in in other states, and from the railroad people present, we thought the joint rates should be about 80% of the sum of the locals, and in making the rate, we endeavored to put in such differential figures as would produce 80% of the sum of the locals.

Q. Instead of making joint rates 80% of the sum of the locals, you put a differential there which you considered would be equivalent to that?

A. Yes.

Q. Was there opposition to these joint rates, at the time they were put in?

A. There was no open opposition; I presume that the railroad preferred that the rates remain as they were, but they recognized the fact that we had the power to put in joint rates then, and didn't offer any open opposition to it.

Q. I am referring more particularly to the rates you established; if they had to have joint rates, did they object to the particular schedule which you put in?

A. Well, in regard to the sum of the locals, I asked Mr. Stith, who was at that time general freight agent of the Iron Mountain, what he thought the rate should be and he said he thought it should be 80% of the sum of the locals.

2072 Q. The rates put in were approximately what the railroads suggested themselves, were they not?

A. Yes.

Q. Did they oppose the differential basis or just went it straight 80% of the sum of the locals.

A. There was no strenuous opposition, but I think they preferred the sum of the locals.

Q. Why did you take the differential method of arriving at that, instead of 80% of the sum of the locals?

A. My idea was that the country merchants could understand how to estimate the rate better in that manner, than they could by the sum of the locals.

Q. That it was a simpler system?

A. Yes, sir.

Q. The revenue producing effect would be the same?

A. Yes, the revenue would be the same.

Q. Mr. Swaim has put in evidence, and I presume you have not heard quite all of it, as to the various changes that have been made in the tariff, and in the rules affecting rates, from the time that the joint rates were put in effect, until the injunction of Judge Van Devanter; I will ask you to state generally, without going into details, what brought about the various changes that have been made?

A. It was brought about on petition from the shippers.

Q. Did you have hearings in all instances?

A. Yes, we always gave notice to the railroads and had hearings on it.

2073 Q. Some of these changes, Mr. Swaim has stated were brought about by adjusting your rates to the interstate rates, I wish you would explain that?

A. I don't know that we always adjusted rates that way but we had certain articles in the same group they used in interstate rates; in some instances, the rate we made was lower than the interstate rate.

Q. I am referring particularly to making groups and mixtures.

A. We did always confine ourselves to the groups they made in interstate rates, but whenever we found that they had an article in the interstate group, and the shippers applied to us for it, we thought it was a good reason why it should be put in the state group.

Q. If the railroads had voluntarily grouped the articles that way, and some interested shipper should ask that they be grouped in the same way, the railroads ought to make the same group on state shipments, you thought, unless they had a good reason for not doing so?

A. Yes, sir.

Q. In the various changes that have been made by the Commission on the rates, what has been the attitude of the railroad companies in the hearings before the Commission, while you were a member of it?

A. I don't know that I understand the meaning of your question.

Q. Have the railroads assisted the Commission in arriving at a fair determination of what the rates should be, when the question of change of rate has been up before the Commission?

2074 A. I will say that the first four or five years I was on the Commission, they didn't show much disposition to give us much light on these investigations, at that source to arrive at the proper rate; after that, they rendered us more assistance, and when we asked what the rate should be, they seemed disposed to give us their ideas about it.

Q. Was the Railroad Commission, while you were a member of it, so far as your knowledge went, ready at any time to change the rates so as to produce a better revenue to the railroads, upon a showing that the revenue then received, was unfair or non-compensatory?

A. If any instance had been shown us to that effect, we would have increased the rate, of course.

Cross-examination.

By Mr. MOORE:

Q. During the time you were a member of the Commission, did it take the most of the time of the members of the Commission to discharge their duties?

A. A man who is conscientious about giving his services to his state, it would.

Q. What I meant to ask was, if the duties of the office were such that it required the time of the members of the Commission pretty much all the time?

A. I thought so, so that I stayed there all the while, in the office.

Q. How often did the Commission hold meetings?

2075 A. Never less than once a month, and frequently two or three times.

Q. What was usually done at those meetings, what was the object of holding the meetings at those intervals?

A. To consider petitions from shippers, in regard to the freight rates, building depots, etc.

Q. Was a good deal of the time of the Commission taken up in hearing complaints about rates?

A. During the interval between these meetings, we considered that amongst ourselves; at these meetings, most of the time was taken up in discussions with regard to freight rates.

Q. Now, you made about 75 changes during the period of time covered by Mr. Swaim's testimony, and all of them were reductions of rates; do you recall any increase of rates you made during that period?

A. I do not now.

Q. You were asked if the railroads made an application to you at any time, to be allowed to go back to the old rates that were enforced before the Commission put this rate in operation in 1900; would you have listened to such an application as that, Mr. Hampton? Would the Commission have listened to an application or would it have granted an application on the part of the railroads, to be allowed to restore the old rates effective before the Commission came into existence?

A. I think if the railroads had made a good showing in their petition, we would have given them a hearing on it, but I doubt very much whether they would have been able to show it

2076 or not.

Q. You say a great deal of your time was taken up in adjusting rates; I believe you stated that a moment ago?

A. Yes, sir.

Q. And yet all your adjustments consisted of reductions, did they not?

A. The petitions we had were from shippers, and, of course, they would not have petitioned for an increase; if we acted at all, it was a decrease.

Q. Did the railroads at any time object, or did they come before you when you gave them notice of hearings?

A. Yes.

Q. Did they make any objections at any time about the changes you made in rates?

A. Indeed so.

Q. They frequently objected to your changes?

A. Most always.

Q. The reductions were made over their objection then?

A. In the majority of the cases, I would say yes.

Q. Did you understand the railroads as acquiescing in those changes, further than they had to carry them out?

A. After the changes were made, I think frequently they did, when they really realized that the rate would be compensatory.

Q. You think that; that is merely your opinion, is it not?

A. Yes, sir.

Q. Didn't the railroads frequently ask for re-hearings after
2077 you put in rates?

A. No, sir, not frequently, and I don't call to memory now where they did in any instance, except on the oil rates.

Q. What change was made in the oil rates?

A. In the first instance, the class rate we applied on oil was cut half in two; afterwards, it was raised by the Commission to 50% above that.

Q. Raised 50% above the rate after the cut?

A. Yes, sir.

Q. What regulations did the Commission adopt in regard to running oil trains by railroads running trains carrying oil cars?

A. They didn't make any in regard to oil cars; we made rules in regard to their receiving less carload shipments.

Q. Was there not a rule made, requiring the railroads to transport oil trains carrying oil, three times a week from Little Rock?

A. That is what I was leading to just now, that they should receive it on three days instead of one.

Q. That is a rule operating without regard to the tonnage the railroad received?

A. Yes, sir.

Q. That rule was an arbitrary one, and required them to carry trains out, without regard to the loading, isn't that true?

A. I don't understand what you mean.

Q. They required trains to go out three times a week?
2078 A. They required those oil shipments to be received three times a week.

Q. Didn't that impose, and wasn't there complaint made before the Commission, that that imposed a very great hardship upon the railroads?

A. I think the railroads did object to making it more than one day.

Q. Wasn't that showing made that sometimes a train would go out as far as Poplar Bluff, and the entire freight receipts would amount to a mere triffle, not more than enough to move the train?

A. That was a very flimsy showing they made on that.

Q. It didn't impress the commission?

A. No, sir.

Q. And wasn't that true in regard to the view the Commission took as to a good many objections the railroads made.

A. They sometimes made a reasonable showing; there was no reason in that at all.

Q. It was also true that the members of the Commission thought

the railroads failed to make a showing at the time the railroads made their application at St. Paul, that the rates were non-compensatory?

Question objected to at the time by attorney for the defendants.

A. I couldn't answer that, because I was not up there myself.

Q. You say the Railroad companies, during this period of time, were objecting and you were busy investigating the rates, and yet in a period of four years, you made 75 reductions and no
2079 increase you can recall; that is your statement, isn't it?

A. No, sir.

Q. What are the facts in that respect?

A. During a period of about seven years.

Q. During that period of 7 years you made no increase in any rate?

A. We made that oil increase that I spoke of awhile ago, but it was after reducing it, and then many short line rates, we increased the branch line rates.

Q. I believe you made a change in the rate on sugar, didn't you Mr. Hampton?

A. We changed that 300 mile haul on sugar.

Q. You changed it from 15 cents to 13 cents?

A. Yes, sir.

Q. What was the object of that change?

A. We thought probably it would force Mr. Perkins' road to give them a better rate to Texarkana from New Orleans.

Q. It was for the purpose of adjusting interstate rates?

A. We didn't think it would affect hauls in Arkansas.

Q. It was for the purpose of affecting and re-adjusting the interstate rate?

A. It was for the purpose, in my own mind, thinking it would have that effect.

Q. Why did you think it would have that effect.

A. Because the Texarkana people could ship around by Helena and over to Texarkana, and get a less rate than the Kansas City Southern were giving them.

2080 Q. How could they do that; explain to me how they could do that?

A. If the railroads built the rates as they sometimes do, take the rate from New Orleans to Helena and add the rate from Helena to Texarkana, the sum of those two rates would be less than they were coming the other way.

Q. At the time this order was made, the Iron Mountain Railroad and the Kansas City Southern hauled sugar from New Orleans to Texarkana at the same rate, prior to that time?

A. I don't remember.

Q. If your purpose was to force the reduction in the rate of the Kansas City Southern, it must have grown out of the fact that the Iron Mountain was at that time, charging the same rate as the Kansas City Southern was, otherwise, there would have been no need

to put compulsion upon the Iron Mountain, causing it to lower its rate.

A. Not necessarily.

Q. Why did you think it necessary to take that action in order to force down the rate of the Kansas City Southern?

A. The Kansas City Southern could be charging rates we would think would be too high, and yet be just in line with the Iron Mountain rate or the other rate.

Q. In what way did you think the reduction of the rate between Helena—of the intra-state rate between Helena and Texar-
2081 kana would bring about a reduction of the rate of the Iron Mountain from New Orleans to Texarkana?

A. I was not figuring on the sugar coming by the Iron Mountain from New Orleans.

Q. I understood you to state awhile ago, that your object was to force the Kansas City Southern to give a lower rate by competition with the Iron Mountain, though the Iron Mountain would bring the sugar further, from New Orleans to Texarkana, via Helena.

A. No, this sugar came up by Shreveport, over the Kansas City Southern, from New Orleans.

Q. Repeat then the statement made awhile ago in answer to my question, as to the manner in which the intra-state rate from 15 to 13 cents would affect the rate from New Orleans into Texarkana; I asked you that question; I wish you would repeat your answer to it?

A. My idea was if the railroad did as they sometimes do, build the rates on the sum of the locals, so to speak, that the direct rate would give them some rate that would be less than the Kansas City Southern had in.

Q. In other words, you thought the sum of the locals in the different states, between New Orleans and Texarkana, via Helena, would control the interstate rate, did you not?

A. Yes, sir. I thought it would give Texarkana a better rate.

Q. Why did you think that? What suggested such an idea as that to you?

2082 A. I had been informed that railroads sometimes built their rate in that manner, and rather than let the shipment be diverted around by Helena, they would rather give a rate by the other way.

Q. The Commission put in this state rate, for the purpose of forcing down the interstate rate?

A. We hoped it would have that effect.

Q. That was the purpose of it, wasn't it? That was the purpose of the order?

A. I guess it was.

Q. I believe you stated that the railroads acquiesced in this joint rate, did I understand you to state that? Did you mean to state that?

A. Yes.

Q. Isn't it a fact that the railroads were so much opposed to the application of a joint rate by the Commission, that they carried the

question, to the courts, and litigated the power of the Commission, and procured a ruling of the Court that the commission had no power to do that?

A. Formerly they did.

Q. Referring to your statement that the railroads acquiesced in joint rates on different lines, is it not a fact that the railroads litigated that question and carried it to the Supreme Court of the State before those rates were put in? That is true, isn't it?

A. That is my impression.

Q. They were not acquiescing at that time, in the Commission putting in joint rates?

A. No, sir.

2083 Q. When did they acquiesce? When did they have a change of heart and acquiesce?

A. It was when we put in a joint rate.

Q. I believe you stated the plaintiffs in these suits acquiesced, didn't you?

A. The Iron Mountain and Cotton Belt?

Q. Yes?

A. All the roads as I understood it.

Q. Did the Commission publish a tariff of those joint rates?

A. We did.

Q. It was an official publication, wasn't it?

A. Yes, sir.

Q. I hand you here a document marked St. Louis, Southwestern Railway Co., supplemental No. 22, Joint Distance Tariff, #3418, now I want you to state if that was not filed in the office of the Commission by the St. Louis, Southwestern Railroad Company, with the indorsement in red letters on it, which appears there now, on the paper which I hand you?

A. "Filed under protest"?

Q. Yes?

A. Yes, sir, all their tariffs they filed that way.

Q. The railroads, at the time you put in that joint rate, prepared a tariff based on it and filed it with the Commission, and that tariff contained a written protest across the face of it, didn't it?

A. Yes, sir, it is not my recollection that any of the others

2084 did that except the Cotton Belt.

Q. Will you read that indorsement on there to the stenographer, please?

A. "Published by the St. Louis Southwestern Railway Co., under protest, and the right to contest same is reserved."

Mr. HILL:

Q. What date is that?

A. That is not shown.

Q. The date of the tariff will show?

A. They didn't date it where they put that across it; I don't know when the tariff was published.

Examination resumed.

By Mr. MOORE:

Q. Read the date out of it?

A. July 10th, 1903; the Cotton Belt made that rule even if the rates were made three times higher than they were; they always had protest written across it. They may have had a mental reservation that they did not want the tariff, but as I take it, they accepted the tariff, and went on and put it in according to the order we made.

Q. You base that upon the fact that they did go on and obey the orders of the Commission?

A. Yes, sir.

Q. You would have been likely to have had the sheriff after them if they had not done that?

A. We would have made them pay a penalty.

2085 Q. What did I understand you to say was the basis of the joint rates? Did you say 80% of the sum of the locals?

A. We tried to make it so it would produce 80% of the sum of the locals.

Q. Did your joint tariff have that result?

A. I have never figured it to see; I think it did.

Q. What is the rate for 200 miles, we will say, on a shipment of sugar?

A. I couldn't say, unless I had a tariff before me.

Q. I have a tariff before me; it is 13 cents on carload lots, do you know what the rate for 100 miles is?

A. No, I don't remember any of those rates now.

Q. It is 11 cents; now, Mr. Hampton, suppose you made two shipments, one of 100 miles each, continuous shipments on one line of railroad, what would it come to at 11 cents?

A. 100 miles on each road?

Q. Two shipments on one road at 11 cents per hundred miles, would be about $22. wouldn't it?

A. You mean 20 miles?

Q. I say, two shipments of 100 miles each would amount to what, on a basis of 11 cents per hundred?

A. Passing over two roads?

Q. Passing on one road or two roads?

A. It depends on the weight.

Q. Well, assume that you shipped a hogshead of sugar from Little Rock to a point 100 miles distant, on the Iron Mountain Railroad; its destination is 100 miles further than that point; now, your tariff rate for 100 miles on a similar shipment is 11 cents; now, if

2086 it is transferred to another line of railroad and carried 100 miles further on that, each one of those roads, under the single line tariff, would get 11 cents; that would be 22 cents, for transporting it on single line rates for 200 miles, isn't that correct?

A. If there were no joint rates.

Q. Under your joint rates, it would amount to 13 cents, wouldn't it?

A. What did you say the rate was for 100 miles?

Q. 300 miles is the maximum; we haven't got to that. The point I want to get at is this; your basis of 80% was not observed there?

No, not where the maximum is reached.

Q. That would be instead of 80%, that would be about 17 cents, 80% of 22; your rule didn't work out that way, did it?

A. It worked out in no instance where the maximum was reached.

Q. I will put the matter in another way; under your rule, it provided that the total htrough joint rate shall not exceed that charged on a single line haul of 300 miles, on any of the commodities mentioned?

A. Yes.

Q. Your rate for 300 miles on sugar is 13 cents?

A. Yes, sir.

Q. Now, your rate for 5 miles is 13 cents?

A. No, I reckon not.

Q. I have that before me here; commodities, carloads, it is 8 cents?

2087 A. You said 13.

Q. I said for 5 miles; the differential is 5 cents; that makes 13 cents; you have the same rate for hauling sugar 5 miles as you have for 300 miles, under your tariff?

A. No, sir.

Q. If it happened to go over two lines of railroad?

A. If it happened to go over the distance on one road, that would make it 8 cents.

Q. To put it at a distance that might cover two lines, say 25 miles, the joint rate on two lines of railroad for 25 miles is the same that it is for 300 miles?

A. You mean 25 miles on each road?

Q. I mean a shipment going over two lines of road.

A. For a distance of 25 miles?

Q. Yes; here is the 25 mile rate; it is 8, with a differential of 5 cents?

A. It would be 13 cents.

Q. Your rate of 13 cents applies on a joint rate of 300 miles, as well as on a single rating, doesn't it?

A. Yes, where it reaches the maximum.

Q. What is the theory of distance tariffs; on what theory is it made? Why did the Commission adopt that theory?

A. Because they wanted to give every shipper the same rate for the same distance.

Q. Does that illustration I give you give every shipper the same rate for the same distance?

A. Every point for the same distance, would give the same rate.

Q. Do you count 20 miles at 13 cents per hundred weight

2088 for sugar, the same as 300 miles?

A. Any town in this state, for a distance of 25 miles, would get exactly the same rate; any town where the 300 maximum applied, would get the same rate; that is what I meant by every town getting the same rate for the same distance.

Q. The intermediate points, intermediate distances, are not uniform then?

A. That is not what we intended.

Q. Isn't it the intention of distance tariffs to be constructed upon a scale?

A. My idea is to give every town the same advantage for the same distance?

Q. Give every town the same rate for the same distance; take a town that is 5 miles away from the commercial center, and you give it a rate of 13 cents a hundred pounds, and take another town that is 200 miles away, and give it the same rate, is that carrying out your principle?

A. Yes, because they get the same rate as another town the same distance away.

Q. What you call a distance tariff is one that makes the rate uniform between different points; uniformity of distance between different points and the common market, but it takes no account at all of the distance of the transportation?

A. They do take an account of the distance in transportation, so far as the rate is concerned; otherwise, our tariff would have a straight line haul 13 cents.

Q. You would give a town 300 miles away the same rate as one 25 miles away?

2089 A. Where it passes over two roads,—yes, we did in that instance.

Q. Where is lime produced, in what part of this State?

A. It is produced up in Washington and Benton County, and just above Batesville.

Q. And where is the market for it, what part of the State is the market in?

A. All over the state I guess.

Q. The markets then are some of them your maximum rate distance, 300 miles from the producing point? Your markets are 300 miles away from the point of production?

A. There are a few that far.

Q. Some of them are?

A. Yes.

Q. Your maximum rate for 300 miles is 9 cents per cwt. Now, your rate for 55 miles to 75 is six cents; your differential is 3; that is 9 cents?

A. Yes, sir.

Q. Now, in any market that has to be reached by two lines of railroad, the rate is the same for from 55 to 75 miles that it is for 300 miles?

A. In any instance where the maximum is reached, that would be the rate.

Q. Is it not necessary, to reach any point on the Frisco road in the extreme northwestern part of the State, to go over two or more lines of road, in transporting *lime* to market in this State?

A. Yes, when you go any distance.

2090 Q. Do you regard that as a logical tariff, a tariff that has an effect such as I have called your attention to?

A. Well, yes, because it does not cost much more to haul for two or three hundred miles than it does for one hundred miles; if you make the difference according to the distance all the way, it would be prohibitive, and no shipments could be made, and it is better for the railroads and for the shippers both, to have them ship at these rates.

Q. The result of it, however, is to give some for a certain distance, the same precisely that one line would get for a shorter distance?

A. It has that effect in many instances.

Q. Now, do you mean to say that that scale of rates was suggested by the railroad companies?

A. I mean that Mr. Stith—I asked him the question, what he thought the joint rates should be, and he said 80% of the sum of the locals.

Q. I am asking you the question, if you mean to state that a tariff, if the joint tariff, operating as I have just illustrated by questions I have asked you and by the instances I have shown, was suggested by the railroad companies?

A. We did not go into the effect of the maximum haul; that was not brought up at the hearing.

Q. It is a fact that these details were not discussed at the time you arranged this tariff, and that you had the meeting with the representatives of the railroads?

A. I do not remember that that maximum question was discussed.

2091 Q. Can you point out a single instances on this tariff, where the joint rate is 80% of the sum of the locals?

A. I don't know whether I could or not, without going over it; the rate clerk was instructed to get up such figures for differentials as would produce that effect, and we depended on him to a great extent.

Q. Why did you follow the interstate practice of railroads in the particulars which you referred to a while ago?

A. Because we thought the railroads would be fair to themselves, and would not make such mixtures in interstate shipments as ought not to be mixed.

Q. Tell me what you mean by that statement, that you thought they would be fair to themselves?

A. I did not think they would put in such articles as ought not to go in interstate shipments, because we had no power to make them do it.

Q. Don't you mean by that this: You thought if the railroads could afford, with reference to the cost of transporting this commodity, to add the particular item or particular commodity to the group —commodity group—if they did it, it indicated they could afford to do it, with reference to the cost of transportation, and if they could afford to do it in interstate transportation, they could afford to do it within the limits of the state; isn't that what you mean?

A. The mixing of those groups gave St. Louis and Memphis an

advantage over Arkansas cities in some instances, and we felt like we ought to be protected, and if they could afford to do it in interstate business, they could afford to do it on state busi-
2092 ness.

Q. Your intention was to do it by adjusting your rates to interstate rates?

A. That governed us frequently in making the mixtures.

Q. You did that because you thought there ought to be, in justice to the shippers of Arkansas, a just and fair relation between the state and interstate rates, that is what you did it for, wasn't it?

A. I don't believe I understand that question.

Q. You stated a moment ago, in shipping from Memphis to St. Louis and adding different commodities to the mixture and in not doing it within the state, there was unfairness practiced against the shippers of the state; if that is true, you recognized that there is a relation between state and interstate rates, that must be kept fairly adjusted in order to avoid injustice to the state shipper.

A. We thought that the railroads, in moving a shipment for 50 miles in Missouri and 50 miles in Arkansas, if they had a certain rate for that, they could afford to move it 100 miles in Arkansas at the same rate, that crossing the line did not cut any figure in the revenue.

Q. What they could to do on a haul of fifty miles in each state, they could do on a haul wholly in Arkansas?

A. Yes.

Q. What do you mean by "afford to do"?

A. If it produced them revenue for 100 miles, half in Arkansas and half in Missouri, it should produce them revenue for a haul of 100 miles wholly in Arkansas.

2093 Q. You were assuming the rate was based on the cost of transportation?

A. Yes.

Q. And that they should be just, on account of the fact that they were supposedly based on the cost of transportation—that was your idea, was it?

A. The railroads themselves do not always adjust rates on the cost of transportation.

Q. But you acted on that theory in that instance, didn't you?

A. As I stated awhile ago, we considered it a discrimination against Arkansas shippers, for those interstate mixtures to come in, and we didn't see why, if it was right in that instance, it was not right in Arkansas.

Q. When did I understand you to state you began your duties as railroad commissioner?

A. January, 1903.

Q. I believe you say the railroads showed no disposition for four years, to render any assistance to the Commission?

A. They didn't seem to, as much so as they did the latter years.

Q. What did they do in that direction, in 1907?

A. Frequently we tried to adjust the rates here in Arkansas;

Mr. Calef and Mr. Stewart would help us in trying to arrive at what was right between the shipper and the railroad.

Q. In what way would they help you?

A. Give us their opinion; the first three or four years, they seemed to be afraid, and wouldn't give it.

2094 Q. Did you usually act upon their opinion when they gave it to you?

A. Not altogether; it would have its influence with us, and not only that, but we would get up tariffs from other states, and tried to arrive at what was right.

Q. I think you stated on your examination in chief, that in basing your joint rate on 80% of the sum of the locals, you had reference to the practice in other states, did I understand you correctly?

A. No, sir.

Q. You referred to the two things in the same connection; you said you made inquiry as to what prices were in other states?

A. We made inquiry as to what rates were in other states.

Q. I mean the practice in fixing rates?

A. Yes, and what the railroads were doing in interstate business.

Q. And it was on that basis that you reached the conclusion that 80% of the locals would be a fair basis, was it?

A. Mr. Stith's remark had more to do with me than any other investigations I made.

Q. If it turns out your tariff does not yield, or does not turn out that way in actual practice, then you did not accomplish what you intended when you started out?

A. No, as a whole, if the tariff does not produce in the neighborhood of 80% of the sum of the locals, we did not do what we thought we were, because the rate clerk was instructed to make up the

2095 tariff that would bring that effect.

Q. Who was the rate clerk?

A. Conley.

Q. You stated a while ago that it did not cost much more to transport commodities 200 miles than 100. What, in your opinion, enters into the cost and into the——

A. I have never studied out that question, but I just got that from general information. I have heard railroad men say that themselves; that it didn't amount to a great deal more for the longer distance than for the shorter.

Q. What are the principal factors that enter into the making of commodity rates?

A. Well, you should consider the revenue to the railroads, and you should also consider the interest to the shipper.

Q. Well now, treating it from a standpoint of——

A. And you should also consider what the commodity is.

Q. What do you mean by that?

A. Well, you might get in a rate which would be prohibitive.

Q. Now, in determining what is the revenue what factors enter into your consideration in fixing commodity rates?

A. Well, I have an idea what factors entered into it, running trains and things of that kind; that is, the expense, but we never

attempted to do anything of that kind. We got our information from the railroad people themselves. Talking to them we got the best information we could and just guessed at it and put in the rate we thought was right.

Q. What characteristics—inherent characteristics—in the business of transportation entered into the consideration of the Com-
2096 mission in fixing commodity rates?

A. I don't understand just what you mean by characteristics.

Q. Why, what difference would you make, if any, and on what grounds between two articles, one of which was bulky and light and the other dense and heavy?

A. Well, of course, we were governed by the differences the railroads had been making themselves.

Q. What I want to know is did the Commission itself study these subjects and consider them in fixing the tariffs for themselves?

A. Well, we knew 100 pounds of corn should bear a less rate than 100 pounds of dry goods or calico.

Q. Why?

A. Well, corn is heavy and a less valuable article and the shipper can not pay as high a rate.

Q. Well, that is the commercial condition you are considering there now. What considerations were covered with reference to its effect in compensating the railroad company for the services rendered. Did you take that into consideration at all?

A. I didn't hear that.

Q. I say did you take into consideration the compensation that would accrue to the railroads in fixing the rates?

A. Yes, sir.

Q. Now, take the two instances you spoke of, for instance, corn and calico, in what respect did those two articles differ in the opinion of the Commission as to a rate that would be compensatory to the railroads?

2097 A. Well, if we didn't have the benefit of the experience of others and of railroad men themselves, and tariffs we got from them and from other states, we wouldn't know anything about it at all.

Q. Does the fact that the movement is small have any effect on the Commission in fixing their rates?

A. Why, of course, we made less than carloads higher rates than carloads.

Q. I am not speaking now of it in that respect, but, taking a commodity, the entire movement of which in a state was small, infinitesimal, to use a word that was used here today, did that have any effect on you in fixing the rates of that article as against one of much larger tonnage?

A. I presume it did, but if it hurt the railroad it wouldn't hurt much and I would be willing to take chances on it. While if it was an article that moved in larger quantities, if it was a rate they couldn't stand, it would hurt them worse.

Q. You thought you would do them less injustice on tonnage of a smaller bulk or volume than on larger?

A. If we happened to make a mistake it would be less injustice, of course.

Redirect examination.

Mr. HILL:

Q. In making joint rates is it not customary in all tariffs,
2098 both state and interstate commission tariffs, to allow a higher rate where the given distance is over two roads than where it is over one road?

A. Yes, sir.

Q. And in putting in those joint rates you were trying to conform to that practice?

A. Yes, sir.

Q. You think that is a just tariff, where commodities move 25 miles on one road and 25 miles on another road to give a higher rate than if it moved 50 miles straight away?

A. If there is more expense attached to the handling by reason of the junction point the railroad should have more compensation.

Q. And that is the theory upon which you put in these joint rates?

A. Yes, sir.

Q. Now, if the railroads had shown to the Commission while you were a member of it that your rate clerk had made mistakes and that your joint tariff as a whole did not represent approximately 80 per cent of the local would your Commission have corrected that rate?

A. Yes, I think they would.

Q. Mr. Moore has questioned you about these 75 instances of changes in 5 or 6 years. I will ask you if, in addition to these 75 instances of changes, the Commission did not pass upon other complaints where they did not make reductions?

A. Yes, sir.

2099 Q. Have you any idea how many?

A. No, I can't recall now.

Q. As many or more than where you granted the petitions?

A. No, I guess petitions were granted in more instances than were turned down.

Q. You did turn down a great many did you not?

A. I don't remember how many now.

Q. You discussed informally with shippers many questions upon which, after discussing with you, they did not file formal complaints, did you not?

A. Yes, sir.

Q. That has been the practice of the Commission always, has it not?

A. Yes, sir.

2100 J. D. WATSON, being first duly sworn, on examination deposeth as follows:

Mr. HILL:

Q. Mr. Watson, when you were on the stand in St. Louis you were requested to furnish a statement of interstate adjustments to meet the court tariff. Have you prepared that?

A. I have entirely overlooked it until you called my attention to it just now.

Q. Will you get that up for me?

A. I will endeavor to do so as promptly as possible.

Q. You will find on page 310 of your testimony where you were to prepare that. I believe there was one other thing I thought was here, but I don't see it. I want you to also give me your interstate tariffs, not to put into evidence, but the dates from your tariffs from November 2nd until the court tariff was made, which I believe was June 1st.

A. You want the interstate tariffs to cover readjustments made between November 2nd and June 1st?

Q. Yes, sir.

A. You mean all the various interstate tariffs?

Q. That would affect the Arkansas tariff.

A. Interstate traffic?

Q. Yes. Now what was called for at St. Louis at this one page was this, those that were just rates according to the court tariff.

2101 A. Well, the tariffs were not readjusted to any very great extent between November 2nd and June 1st.

Q. Well, I would like to have those tariffs. How soon can you get them up?

A. I guess I can possibly have them here next week.

Q. You understand I want all interstate tariffs that would affect the Arkansas traffic to November 2nd?

A. Yes. There will be quite a trunkful of them. You want the tariffs themselves, as I understand?

Q. Yes. You can indicate in the tariffs where these adjustments are. You see I don't want to encumber the record with too much tariff material. I suppose we will have to have the tariffs here for examination and you can show it more clearly on the tariffs themselves than any other way, can you not?

A. Yes, sir.

Q. Well, you will have them for us next week?

A. Yes, sir.

2102 A. R. BRAGG, being duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. Will you please state your name, age, residence and occupation?

A. A. R. Bragg, residence, Little Rock, Ark., Manager of the Little Rock Merchants Bureau.

Q. How long have you been manager of the Little Rock Merchants Freight Bureau?

A. Five years.

Q. What are your duties in that bureau?

A. My duties as manager of the Merchants Freight Bureau are really as a traffic manager for the merchants and manufacturers, to give them their rates, see that they are protected against other jobbing centers, or manufacturing places, in the matter of freight rates, and act as their agent in a general way, so far as traffic is concerned.

Q. Your duties in this freight bureau necessarily render you familiar with the existing freight rates in the state?

A. Yes, sir.

Q. Prior to your connection with the Merchants Freight Bureau, what was your occupation?

A. I was in the service of the St. Louis, Iron Mountain Railway for 25 years; I was in the freight department all the time,
2103 all the way from local freight agent to division freight agent.

Q. I wish you would state the various positions you held in the railroad service?

A. That would be pretty hard; I might say practically from messenger boy, almost.

Q. To Division Freight Agent?

A. Yes, sir.

Q. How long were you division freight agent?

A. About fifteen years.

Q. You are familiar with the freight rates, state and interstate, in the State of Arkansas, and have been for a number of years?

A. Yes, sir.

Q. In fact, that has been your study for the last 25 years, ha-n't it, or something like that?

A. Yes, sir, I have been more or less connected with it all the time, in both capacities, as an employee of the railroad, and an employee of the merchants.

Q. Your employment by the merchants causes a familiarity with the rates, equal with that of an employment by the railroad, doesn't it?

A. I think so; that is, in a general way; I am not probably as familiar with the details as some of the traffic men.

Q. I wish you would state from your knowledge and familiarity with the freight rates prevailing in this country, the manner or system on which they are constructed?

A. You mean the method of making rates?

Q. Yes.

2104 A. Well, they have two methods—one is by conference among themselves; that is, with reference to competitive rates; the individual or local tariffs, I think, are made up in their offices, by their rate people.

Q. Their competitive rates are made in conference?

A. Yes, sir, altogether; they are promulgated by a chairman or agent.

Q. You are referring, I presume to the interstate rates?

A. Yes, sir.

Q. Prior to the adoption of a commission tariff, how were the state rates made?

A. They were made in practically the same way; they didn't, however issue—their tariffs were not—I don't think their tariffs into Arkansas were issued by a chairman, not all of them, some of them were, and some were not; some of the tariffs even to competitive points were not issued by a chairman.

Q. Prior to the commission rates were there any what was known as jobbing rates? to commercial centers in the State?

A. Yes, sir, between certain points; that is, from jobbing centers to local territory, what is known as non-competitive points.

Q. In other words, the territory tributary to a common jobbing center, had rates made for that particular territory, was that it?

A. Yes, sir.

Q. Did much of the traffic of the state move under those jobbing rates, prior to the Commission's tariff?

A. All of the traffic originating at points from which these
2105 rates applied; of course it was all intrastate traffic, and it was of course, all moved under those rates.

Q. The point that I am getting at is this, what proportion if you could estimate it, of the traffic of the state, intrastate traffic, moved under the jobbing rates?

A. A very large percentage of it; at the time those tariffs were in effect; I could not approximate the percentage, but it was a large percentage, because there was just a few jobbing centers at that time, that supplied the territory adjacent.

Q. Most of the intrastate traffic moved on these tariffs for jobbing centers?

A. Yes, sir, that is merchandise; they had, at the same time, tariffs covering other commodities, such as coal, cotton, cotton seed, and things of that kind.

Q. Were there in effect in this state prior to the Commission tariff, many special rates?

A. These were all special rates.

Q. I wish you would define just what you mean by special rates.

A. Well, a rate that is made, what is called a jobbing tariff, a jobbing tariff, of course, would be a special tariff, that would cover classes and commodities, because it would be different from a mileage tariff, and a great many articles would be taken out of the classification. The classification of that article would be ignored, and it placed under a commodity, just as it is in all the tariffs today; that is what the railroad people call a special rate.

2106 Q. Wasn't there another kind of special rates; these rates from one given point to another given point on certain commodities?

A. Those are the tariffs I am speaking of now; for instance,

there was a tariff from Pine Bluff, over the St. Louis, Iron Mountain & Southern, I think over the Cotton Belt, I wouldn't speak advisedly as to that—there was one from Little Rock and one from Ft. Smith; one from Van Buren, and one from Texarkana; those points at that time were the principal jobbing centers in the state.

Q. Those were what were commonly called jobbers' rates?

A. Yes, sir.

Q. What I wanted to call your attention to, was this, wasn't there rates on lumber, say from Pine Bluff to Fort Smith and other given points, on given commodities?

A. Yes, sir, there was a lumber tariff.

Q. Were there many of those special rates, I am taking lumber for an instance?

A. Nearly everything moved under special rates in those days.

Q. I wish you would mention some you call to mind, that moved under special rates?

A. Practically everything moved under special rates, that is, tariffs prepared for the business.

Q. Those tariffs were then prepared to meet some particular industry or commercial condition?

A. All the time; that is, the jobbing business in those days, was adjusted in its incipiency, and the lumber business was practically the same and the cotton seed oil mill business, and the cotton business, and it was the policy of the railroad people at that time,

2107 to build tariffs that would take care of the business.

Q. Take for instance brick; I believe it has been shown here in some of these proceedings, that a brick industry sprang up here, and probably at Malvern, and other places, was there any special rate put in effect, to take care of that industry?

A. Yes, sir.

Q. Very low rate, wasn't it?

A. Yes, sir.

Q. Were there many instances of that kind scattered over the state, where there was a very low rate given to take care of some given commodity or some new industry?

A. Yes, sir, as I say, it was the policy of the railroads to make rates they found necessary to take care of these different industries.

Q. Now, in framing these various rates, jobbing rates and special rates, and various rates that were in force in this state, what considerations were controlling in fixing a rate?

A. What period?

Q. I am speaking generally, say before the Commission tariff, and then I will take it up later?

A. There were commercial conditions, both commercial conditions and competitive conditions, that brought about a good many of those rates; those rates were a kind of patched up, all over the state.

Q. What consideration, if any, was given to the cost of the service, in fixing these rates, that you are referring to?

2108 A. I can't answer that; I don't think that that always entered into it; I couldn't answer it definitely, but I don't think that that always entered into it, at the time that these merchandise rates were made; a good many of them were what was called merchandise rates.

Q. What data, if any, did the railroads have in order to determine what was the cost of the service upon any given commodity or any series of commodities?

A. I couldn't answer that, I don't know that they had any.

Q. Take for instance coal, in making a coal rate, or a lumber rate or merchandise rate, would the railroads have before them in the formulation of those rates, any data by which they could determine the cost of carrying that coal or that lumber or that merchandise?

A. I don't think they have ever been able to ascertain just what it does cost them; that is, on each given commodity.

Q. After the Commission tariff went into effect, which I believe was in 1900, wasn't it, the first?

A. 1901, I think it was.

Q. What change took place in rate making in Arkansas?

A. You mean the interstate or intrastate?

A. I mean both?

A. Of course, the Commission's tariff fixed the intrastate rates.

Q. Took that out of the control of the railroads?

A. Yes, that practically cancelled all the rates that had been issued prior to that applying on strictly intrastate traffic.

2109 Q. Cancelled all these jobbing tariffs, all these special rates and put in force a distance tariff?

A. I think practically all of them were cancelled.

Q. What change, if any, took place in the formulation and manner of formulating the interstate tariffs, after the Commission tariff went into effect?

A. I can only speak for the St. Louis, Iron Mountain & Southern, because I was in their employ; I only know in a general way about the St. Louis Southwestern; I think possibly—I don't know just how much time elapsed before they revised their interstate rates, that is, to their local territory, points that were not competitive; they adjusted those rates to practically the Commission tariff in mileage from Memphis.

Q. There has been a good deal said in this testimony about the Memphis adjustment, to which you are now referring; I wish you would explain that.

A. The rock Island was then the Little Rock and Memphis road, and they followed this commission tariff out of Memphis by practically placing Memphis on the west bank of the river. The St. Louis, Iron Mountain & Southern protested and it was a year and a half, I think perhaps, after the Commission tariff went into effect, before the Iron Mountain placed their rates on the same kind of a basis; that was done by reason of a suit brought against them or a complaint in the city of Memphis, on some alleged agreement with the City, which, for a consideration of certain valuable franchises

in Memphis, they agreed to make any rate from West Memphis to points in Arkansas, that obtained within the State, intra-
2110 state.

Q. About when was that adjustment reached, if you can recall the date, approximately?

A. I think it was in 1902, over the Iron Mountain.

Q. Now, there has been some testimony in this case about other rates from St. Louis and other points being fixed on the Memphis rate; I wish you would explain that.

A. Well, away back twenty odd years ago, they fixed— the St. Louis, Iron Mountain & Southern Ry. Co. into Memphis, and the Frisco, or the Kansas City, Springfield and Memphis as it was at that time, fixed a differential basis between St. Louis, beginning— really it began at the Missouri River, and came on down and came to New Orleans; all these rates were predicated on the Memphis basis, St. Louis was 30 cents, Cairo was 20 cents over Memphis, and St. Louis was 30; in other words, the St. Louis basis was fixed first, and Memphis was fixed at 30 cents per hundred; we are using one class as an illustration, under the St. Louis rate; they went on down below and made the New Orleans rate the same as St. Louis. I am speaking of rates over the line into Arkansas, interstate rates.

Q. Let's get that a little more clear; the Memphis rate was fixed at 30 cents, using one class as an illustration?

A. No, St. Louis.

Q. What was New Orleans fixed at?

A. At the same as St. Louis. If St. Louis was a dollar to Little Rock, it would be 70 cents to Memphis, and a dollar to
2111 New Orleans; Kansas City was ten cents higher than St. Louis; those differentials applied all the way down, and were the basis then and are today the basis of fixing the rates to Little Rock from that territory.

Q. How was that arbitrary or differential arrived at? Was it based on the cost of service or commercial conditions, or what was it based on?

A. No, sir, it is a system that obtains all over the country, and it is used,—it is an arbitrary made by traffic people. If they get together and they find that two rates added together are against the movement of traffic generally, they fix a basis for making a through rate; for instance, from Chicago, Cincinnati, Louisville or Pittsburg, or from any point beyond the river.

Q. Are those arbitraries or differentials determined by differences in costs in moving that commodity or are they determined by other considerations?

A. The cost, I don't think, enters into the basis of making those rates.

Q. What does enter into it?

A. The territorial location is largely the reason for it.

Q. What you might term commercial, competitive and geographical conditions?

A. Yes, sir.

Q. Trade conditions?

A. Yes, sir; in all those rates, I presume, they tried to keep all markets on a parity as far as possible.

Q. That is the object of these arbitraries, to keep these various markets on a parity?

2112 A. Yes, sir, that is the only object; of course, the cost of doing business, I presume is thought of, at the time these rates are made.

Q. Is it any more than thought of?

A. That is all.

Q. Is there any data before them by which they could act upon any more than thinking about it?

A. I don't think so; I would like to explain a little further about this basis; it is followed very closely in making all through local rates; the same basis; Little Rock is the hub, is the axle that controls the entire rates of this state.

Q. You are referring now to interstate rates?

A. Yes, sir; in making rates out of Memphis and St. Louis to local territory, like Arkadelphia or Malvern, or some of these points down here, they hug pretty close to the same basis, the differential between Memphis, St. Louis and New Orleans, that they do to the common points.

Q. Now, take the rates that have been denominated in this hearing as trans-state rates, that is, freight moving across Arkansas that does not stop in it; for instance, lumber from Louisiana North, from states west to common points, such as fruit, from California to the east, and live stock, and various freights that move across Arkansas, without having any destination in the state or originating in the state, what effect, if any, do the state rates have upon those rates?

A. None whatever; you have business from St. Louis to

2113 Louisiana and to Texas and to Mexico.

Q. Business passes through Arkansas, without any destination or origin in Arkansas, and for convenience in this case, it has been termed trans-state business.

A. I don't think Arkansas rates have any effect on those rates.

Q. It is in evidence here, I believe, that the volume of traffic of that class, trans-state traffic on the Iron Mountain is 51% of the total traffic, of the remaining 49% of the traffic; I would ask you if you could estimate what proportion of it is affected by this Memphis adjustment of which you have been speaking.

A. You mean the interstate traffic?

Q. Yes, sir.

A. The traffic affected by the Memphis adjustment?

Q. Yes, and both these other adjustments.

A. That would have reference to only freight that went to non-competitive points.

Q. I want you to make an estimate, if you can, of the 49 per cent of the entire freight traffic now remaining, after the trans-state traffic is taken out of the whole, that would be affected by the Memphis adjustment, which you say is controlled by the state rates; what proportion of this remaining 49% is controlled or affected

by that Memphis adjustment on these arbitraries, based on the Memphis adjustment?

A. The rates to the common points are not made on the basis of the State Commission tariffs, but I should say that that pro-
2114 portion of the traffic that is strictly local on the Iron Mountain railroad, affected by those rates, would be about 15%.

Q. How do you arrive at that 15%.

A. Of course, I can only approximate it; it is merely guess-work; long experience and knowledge, and of course, the amount of traffic that moves out of St. Louis and Memphis and New Orleans, and other points, to what is known as local points, would warrant me in believing that that would be about a fair estimate.

Q. All the traffic moving into common points is not affected by this?

A. The rates are not made on that basis, no, sir.

Q. How many common points are there in Arkansas?

A. I could only approximate that; there is about 25 or 30 of them.

Q. They are all of the larger towns of the state?

A. All points where there are junctions of two or more railroads, are common points.

Q. They are not affected?

A. No, sir; to some extent they are, of course.

Q. How about the freight passing the line like to Poplar Bluff, say from Hoxie to Poplar Bluff; is that affected by this?

A. No, sir.

Q. How about freight originating in the state, that is shipped out, like coal, cotton, cotton seed, cotton seed products, and things of that kind; are they affected by the Memphis adjustment and these state rates?

2115 A. The coal tariffs?

Q. Yes, sir.

A. Not to my knowledge.

Q. How about cotton and cotton seed products?

A. Well, the cotton seed products—no, neither cotton or cotton seed products are affected by the Commission tariffs, that is, interstate.

Q. How about the cotton, I believe you say it is not?

A. No, sir.

Q. How about lumber?

A. I consider it in the same class with coal; it is covered by its own rate

Q. Then, when you go to consider the amount of traffic affected by the rates based on Memphis rates, which are controlled by the Commission rate and others controlled by Memphis, you exclude the products of the state, you exclude the common points, you exclude these intermediate shipments, and you exclude the transstate, and the remaining part, you estimate as something like 15%?

A. I would say that would be a very fair estimate; there isn't anything that goes into the state except merchandise, agricultural im-

plements; there is some coal, but it is not governed by the state rates.

Q. In fixing interstate rates, what effect, if any, has the combination of the locals on those rates?

A. Well, there have been instances where, by using the common point rates, plus the commission tariff rate, that the through rate could be disturbed.

2116 Q. What is the extent of that, speaking generally of the whole rate fabric?

A. I don't think there has been very much of that.

Q. You find instances here and there, I presume, where that is the effect?

A. That has been done; it has been done by shippers of St. Louis and Memphis and other points, and I think possibly that that had its effect on a few commodities into Hope, the only point I know of right now which I have in mind, where it affected the through rate, where they were forced to reduce the through rate which they had established on the regular basis, in order to meet this combination. There were such safe-guards thrown around using those combinations that it was impossible for anyone to use them unless they made a local shipment of a car or less than a car, whatever it might be, out of a point where it was first stopped.

Q. In 1906 and 1907, were there any general advances in the interstate rates in Arkansas?

A. Yes, sir, the first advance that was made to common points, was in February, 1907.

Q. You say the first advance,—by that, what do you mean?

A. I mean the first in number of years.

Q. Was that a general advance all along the line?

A. It was a general advance to common points.

Q. What I mean to say, it was a general advance of all the commodities and classes to common points?

A. Yes, sir.

2117 Q. Or was it to adjust a few?

A. It was an increase on practically everything, probably only of the first three classes in the tariffs, were not included.

Q. To all common points?

A. Yes, sir.

Q. That was in February, 1907?

A. Yes, sir.

Q. Could you estimate the percentage of that increase?

A. The average, I think, at that time was about 15%.

Q. Was there another increase in 1907, prior to obtaining the injunction in this case?

A. The next increase in the rates to common points, was made in September, 1908.

Q. That went into effect before the injunction went into effect?

A. They both went in about the same time.

Q. The injunction went in, if my recollection serves me, the 31st of August, but did not become effective until about the 1st of

November, did the interstate increase become effective before November 2nd?

A. Yes, sir, I think the tariff was issued to be effective September 1st, 1908, and was rejected by the Interstate Commerce Commission, for some reason, and then it was re-issued effective September 24th; I may be wrong in my dates, but I think that is correct.

Q. Could you estimate generally the extent of that advance?

A. That increase, if we had permitted it to go into effect,
2118 to the merchants and manufacturers, would have been about fifty per cent.

Q. That didn't become effective?

A. Not all of it; we had a conference with railroad people, after filing a complaint against them at Washington, at which they did withdraw some of these proposed advances.

Q. I believe that was after the injunction became effective; I don't care about going into any of the matters since then.

A. That was after No. 3 was enjoined.

Cross-examination.

By Mr. MOORE:

Q. Will you explain the system upon which rates are made through conferences, and the instances in which that is done, and the instance in which it is done through individual action of the railroads.

A. How they are made?

Q. Why it is done, what are the controlling considerations affecting the co-operation in the one class of instances, and separate actions in the other?

A. In the making of the rates at common points, which is done by conferences; I don't suppose you want the detail of how they do that?

Q. Oh, no.

A. The rates to local points are made in the general freight office where the clerks make up the rates; the conditions are dif-
2119 ferent of course; one is competitive and the other is non-competitive.

Q. Do I understand you to state that rates to common points are made through conferences between representatives of different roads?

A. Yes, sir.

Q. Why is that true?

A. Well, for uniformity; two lines reaching the same point from the same point, would not want to have different rates; that would not be to their interest, or to the interest of the public.

Q. What would be the effect of rates to common points through independent actions of common carriers, without regard to the rates of others?

A. That would depend upon whether each line adopted the other's rate or not.

Q. Suppose they happened not to do it?

A. They would have two or three different rates.

Q. Would that be beneficial to the public?

A. No, it would not.

Q. If they acted independent of each other, and without conference, there would be different rates upon different lines?

A. Yes, sir.

Q. That really is the reason that conferences are held, for the purpose of adjusting rates to common points, isn't it?

A. That is one reason, and one line couldn't adopt a different rate or reduce a rate, without the consent of the other one, unless they did it arbitrarily.

2120 Q. What were the jobbing centers in this state, at the time the State Railroad Commission began to make tariffs; I believe that was in 1900 and 1901?

A. Little Rock, Pine Bluff, Fort Smith, Van Buren, Texarkana, were the principal points; there were only four or five of them; possibly Camden.

Q. I understand you to state that special rates, which you call jobbing rates, were given by the different railroads, from those centers to the territory in which they obtained?

A. Yes, sir.

Q. What was the purpose of that?

A. As I stated, the purpose was to encourage the building up of the business I suppose.

Q. Could jobbing points be built up and developed on any other system?

A. Well, the jobbing points at that time, the conditions were entirely different from what they are now.

Q. Could jobbing points have been developed in this state under any other practice than that?

A. Well, no, except there might be termed a jobbing point, a little town which had a small wholesale house, one house.

Q. I am speaking in a general way.

A. No, not larger points.

Q. Did the Railroad Commission take any action that affected that practice? The practice, I mean, of establishing special rates for jobbing points?

A. It practically wiped out all special rates.

2121 Q. What was the system inaugurated by the commission?

A. Mileage system.

Q. What was the basis, the central point, the central idea, upon which that mileage system was based?

A. That I could not tell you; of course, all of the railroads at that time, had a mileage tariff, which they used where these points were not taken care of by these special jobbing rates. There might be a shipment move from Russellville to Morrillton, or from Prescott to Arkadelphia; that was taken care of by a mileage rate.

Q. How did it operate in practice, what was the effect upon rates, did it operate uniformly; that article was changed upon distances, the rates predicated upon distances the commodities were hauled?

A. Yes, the further you hauled it, the more the rate was, or the shorter the mileage, the less it was.

Q. What I want to understand, was whether the application of the mileage rate was for the purpose of producing uniformity of rates between different sections or different localities, or uniformity in respect to distances the commodity is hauled; which is the principal and controlling idea in distance rates?

A. Well, I could only answer that personally; I don't believe in mileage rates.

Q. I am speaking about the operation, with reference to the practical operation of the commission rates?

2122 A. A mileage schedule confines the traffic, the state traffic, to a less area in miles; for instance, jobbing centers like Little Rock can reach out under a mileage tariff the same distance as they could under the old jobbing rates.

Q. The rate increases in proportion to the distance of the haul, as it increases?

A. Yes, sir.

Q. Did the result which flowed from the Commission rate, sustain that idea? Did the rates put in by them in effect, constitute a mileage rate, or result in cha-ges or rates in accordance with distance that the commodities were hauled.

A. It could not be anything but a mileage basis, because they had no other in the tariff; everything moved under a mileage schedule.

Q. In order to illustrate what I want to know, I will cite an instance. For instance, the rate on sugar is 13 cents for 300 miles; there is no point in the state scarcely in which a distance of that kind would not have to be covered by two or more lines of railroad; now, the rate for 15, 25, 30, 40, and 50 miles, as has been shown in the testimony of other witnesses—I am speaking now of joint rates—if you had a differential prescribed by the Commission to the state haul for those distances, that would make about the same distance, that destroyed the theory upon which the Commission were building up their rates?

A. You mean, when it reaches a certain point, it goes back

2123 to the single line basis?

Q. Yes?

A. I don't know; I couldn't say that.

Q. What is your view about that, as a railroad man, you say you have had a lot of experience.

A. I don't think I catch what you are trying to arrive at.

Q. I will state a case, then, so you will; we will say a rate on sugar, the maximum rate is 13 cents, covering a haul of 300 miles; we will say the rate for 25 miles on a single line is 8 cents, and if it is hauled on two lines, there is a differential of 5 cents, which would make 13 cents for hauling 25 miles; now, is that an adjustment that, from your experience, will prove out?

A. Not altogether.

Q. Did the commission have any regard to the rates that had been enforced, prior to the time that they put in their first tariff in 1901, in preparing their schedule of rates?

A. You mean do they consider the rates that had been in effect?

Q. Yes?

A. I couldn't answer that, because I do not know upon what theory the rates were made.

Q. What effect did the schedule adopted by the Commission have upon the rates as a whole?

A. It was a reduction; it was a general reduction.

Q. And wasn't the reduction on the whole, as much as about 22½%?

2124 A. I never have had occasion to make an estimate of what the actual reduction was; I couldn't answer that question intelligently; that is a reduction as a whole.

Q. At the time the first commission rate was put in, in 1901, you were Division Freight Agent of the Iron Mountain Railroad?

A. Yes, sir.

Q. Wasn't it shown at the time the commission rate was put in, that it resulted in a reduction in the revenue of the Iron Mountain road of 22½%?

A. I don't remember; that may have been worked out, at the offices in St. Louis.

Q. Were you present during the time the deliberations and conferences were had between the representatives of the railroad companies and the commission?

A. Not all the time.

Q. Was there not a representative of the Iron Mountain Railroad here in conference for some days with the commission at that time?

A. Yes, sir, all the railroads were represented at the time.

Q. What was your information at the time, arising from your connection with the Freight Department of the Iron Mountain Railroad, as to the amount of the total reduction that would result from the schedules adopted by the Commission below the former rates?

A. It was a reduction, and it was protested against by all the railroads, but I can't say that I ever did make any figures on what the average reduction was at that time?

2125 Q. Do you think the average reduction would amount to as much as 20%?

A. I expect it was fully that much; when I say that, I mean it was a reduction in the rate.

Q. The schedule contained the provision also, didn't it, that where a class rate, carload and less than car loads, and commodities, in effect from jobbing centers to local points, and in effect between jobbing points and other points within the state were lower than the rates prescribed by the commission tariff that such lower rates should govern?

A. Yes, sir.

Q. There is a provision then, providing that the rates prescribed by the commission should not be lower than the lowest rate that was in effect at the time the commission rates were put in effect?

A. There rates should not be higher.

Q. That is what I mean; I will call your attention to page 14, of

Standard Freight Distance Tariff, which was adopted April 10, 1900, and ask you to read the regulation in that respect?

A. There is one of those tariffs that did not go into effect; I think the first one they got out; they subsequently issued another; which clause is it?

Q. That in heavy type.

A. I just answered that.

Q. Just read it into the record.

A. When the class rate, carloads and less carloads, commodities, carloads and less carloads, now in effect from jobbing centers
2126 to local points and between jobbing points and other points, within the state, are lower than the rates prescribed in this tariff, such lower rates shall govern. That rule was subsequently withdrawn, I think; I don't think it was in the last tariff.

Q. What tariff do you refer to as the last?

A. No. 3; I am not positive, but I think they did take that out.

Q. No. 3 was adopted in 1908, wasn't it?

A. Yes, sir.

Q. Eight years after the railroad tariffs?

A. I couldn't say how long that rule was in there, but my recollection is that the railroads eventually got them to withdraw it.

Q. They had gone a good ways from the old railroad tariffs when #3 was put in effect?

A. Yes, but there was No. 2; I think that was issued in 1905.

Q. Now, were there any railroad tariffs in effect at the time the commission's schedule was adopted, lower than those that are recited in the quotation you have just read from the 1st Standard Distance Tariff?

A. Yes, I think they found a few rates.

Q. What I want to understand is this, aren't the rates that are referred to in the extract that you read into the record a moment ago, from the Standard Distance Tariff, of 1908, supposed to represent the lowest rates that were in force, prior to the time the commission tariff book effect?

2127 A. You mean on jobbing rates?

Q. Yes.

A. Yes, there were some a little lower.

Q. What do you refer to?

A. Jobbing rates.

2128 Q. Well the point I am asking you about is this: if the rates you gave in that abstract were not the lowest before the Commission tariff was put into effect?

A. Oh, certainly, yes.

Q. I believe you stated that the Memphis rate was based on the state rate did you not?

A. Yes, sir.

Q. And the rates from St. Louis and New Orleans and other large jobbing centers which ship into this state were based on the Memphis rate, with the differential?

A. Well, yes. Didn't disturb the rates at common points. It only affected rates at local points, practically. This basis out of Memphis

was predicated with the figures on this tariff, on the distance, until they got to a point where they attempted to maintain the distance between St. Louis and Little Rock, I mean St. Louis and Memphis just the same as to Little Rock.

Q. Let me see if I understand what you mean by common point. You say there is a similarity between the Memphis rate and the state rate. Now, what do you mean by a common point?

A. I mean jobbing centers—common points—as at a junction.

Q. I want to ask you how rates are adjusted with reference to how rates at jobbing points—trading centers—in this state—how rates are adjusted. What are the considerations that enter into the adjustment of interstate rates?

A. Well, do you mean Mississippi rates?

Q. Well, take Memphis. You have taken that as a point upon which rates are built up upon differentials. Upon what distance are jobbing rates allowed? What is the object of it?

2129 A. Well, the basis that has been used has been used for a number of years for making rates from the Mississippi River across to Little Rock and it has not been changed—the basis for it—The rates have been changed. But the real basis is between points where one governs the other. They have not been changed

Q. What is that basis?

A. Well, the rate from St. Louis to Little Rock on one class is a dollar a hundred and from Memphis to Little Rock it is 70 cents. That makes a difference of 30 cents. That is called a differential. * * * That goes on down. I have a memorandum of the figures making these rates. The- were fixed along together. I don't think the railroad people denied them. They are still using them And they have no connection with the rates that are made out in Memphis, protected on the Commission's tariff. They don't follow it at all.

Q. Now, let me see if I understand you. What is the basis of the common rate from Memphis to Plumerville?

A. Well, it is practically the mileage scale, plus——

Q. Well, what?

A. Well, I haven't the tariff before me. Don't understand me to say though that it is the actual mileage, but it is the basis for the rate.

Q. Does that—Does the rate from Memphis to Little Rock enter into the rate from Memphis to Plumerville?

2130 A. No, sir.

Q. Well, let's estimate that the rate from Memphis to Little Rock on a commodity is thirty cents per hundred pounds——

A. Memphis to Little Rock?

Q. Yes. Now, what is the rate to Plumerville?

A. That would depend on the distance.

Q. Would the rate from Memphis to Little Rock and the rate from Little Rock to Plumerville enter into it in any way?

A. No, sir.

Q. How would a merchant in Memphis who applied to a railroad for a rate from Memphis to Plumerville,—how would a representative of the railroad,—on what basis would he figure it?

A. Why, he has a tariff with the rates from Memphis to Plumerville.

Q. Now, is there not some system by which the local jobbing centers in this state are protected against direct shipment from other territories; that is, jobbing centers outside this state?

A. Very little. As long as they make through rates as they do now there is practically no protection.

Q. Can a Memphis merchant—I mean, can a merchant of Plumerville get the same rate, the same rate upon the same ratio, that a merchant of Little Rock can get?

A. No, the rates are not made upon the same basis; that is, the same principle.

2131 Q. Now, are not the common points you spoke of in your answer in which you say the Memphis rates are adjusted with reference to the Commission rates, so adjusted in order to enable local jobbing centers to compete with these foreign jobbing centers?

A. Well, I think they try to do that but they don't always accomplish it.

Q. That is the theory upon which the rates are built up, is it not?

A. I think so. I would like to get clear in your mind, Colonel, about the basis of this rate out of Memphis before the Commission tariff was in effect. The rates out of Memphis were made on a different scale. Now then, they claim they have to make these rates beyond us on a mileage scale,—some of them, the Iron Mountain, as far as Little Rock, fifty miles beyond us, because of the mileage scale—Memphis being on the bank of the Mississippi River.

Q. Texarkana, in Arkansas, is a common point, is it not with reference to Memphis?

A. Yes, sir.

Q. If a merchant wants to make a consignment from Memphis to Texas how does the rate apply on that?

A. Well that rate is, when they go through Texarkana the rate for northern Texas.

Q. I am not talking about Texas at all?

A. Well, I am telling you they apply on it.

2132 Q. Explain what the rate of northern Texas has to do with it? I am ignorant about these things and am trying to get the information?

A. Well the rate through Texarkana is kept sufficiently high to prevent the reduction of the rates in Texas.

Q. In what way is that result brought about?

A. Arbitrarily I suppose.

Q. Is there any connection between the intrastate in Arkansas and the Memphis rate to Texarkana?

A. Well, there is some——

Q. Well, do the commission rates from Memphis fix the rates to common points in this State?

A. No, I think not.

Q. Well, is the rate to Little Rock, and other common points, I mean from Memphis to Little Rock, affected by the state rates?

A. Well they never have changed the basis, I don't think, that the state commission made.

Q. Well, you stated awhile ago that Memphis was practically west of the Mississippi River?

A. In making certain routes.

Q. In making certain points?

A. No, I didn't say that. I said lone points—points that are not competitive.

Q. Then I will ask you if the rates from Memphis into Little Rock are not the same, or less than the commission rates for the same distance?

A. Well, some of them are on some commodities.

2133 Q. Is it not necessary that be the case in order to promote jobbing points in this State?

A. I think so.

Q. If that were not the case it wouldn't be a jobbing point, would it?

A. It depends upon the practice.

Q. Does some relation exist with regard to rates from Memphis to Texarkana?

A. No, I think the basis they use at Texarkana now, was fixed most of it, before the Commission tariff had effect.

Q. What is that basis?

A. That is arrived at arbitrarily like other junction points. There are some rates at Texarkana, as I understand it, one or two commodities, that were made on the maximum mileage.

Q. What are those commodities?

A. I think sugar was one.

Q. Where from?

A. New Orleans. That is the only one I know of that amounted to anything.

Q. Did the tariff fixed on sugar—maximum tariff—influence the rates from New Orleans to Texarkana?

A. Yes, sir.

Q. In what way?

A. Why they reduced them.

Q. In what manner? I mean, what brought about the reduction?

A. Well, what brought it about was they found Texarkana shippers bringing their sugar into Helena and re-shipping it.

2134 Q. That is not answering the question. I asked you how the maximum rate on sugar prescribed by the Commission affected the rate from New Orleans to Texarkana?

A. The rate from New Orleans to Helena was 12 cents and the maximum rate in the Commission tariff was 13. That made a possible combination of 25 cents—no, 23—no, 25 cents, and the railroads had a rate of 27 cents from New Orleans, so they had to reduce it to meet this.

Q. That was a combination of the local rates in Arkansas and the interstate rate to Helena?

A. Yes, sir.

Q. Would that effect a combination of locals?

A. Well, yes, it would form a combination of locals, one state and the other interstate.

Q. Mr. Bragg, could the railroads maintain a rate from Memphis to Little Rock, plus the local rate from Little Rock to Texarkana?

A. I don't think they would attempt it.

Q. Well, could they do it? I mean, in their business.

A. Oh no, certainly not.

Q. So the rate then from Memphis to Texarkana could not exceed then practically the rate from Memphis to Little Rock, plus the rate from Little Rock to Texarkana?

A. Well, there was no such condition.

Q. Well, let me illustrate. There was a suit brought against the Gulf Colorado & Santa Fe in regard to a shipment from some point in Nebraska or Kansas which was billed to Texarkana. The
2135 shipper re-billed it to some point in Texas and a controversy arose about the rate. There was a difference in the interstate rate from the point of shipment to the destination in Texas and the sum of the two rates to that point in Texas plus the local rate to Texarkana. Now, the party had a right to re-ship it and get the benefit from the Commission rates?

A. Yes, sir.

Q. Now, is that not practical in every instance?

A. No, it is not practical everywhere. If there is such a combination prevails though, he can do it.

Q. Well, if you had a large consignment from St. Louis to Texarkana or from Memphis to Texarkana, and you could rebill it from Little Rock to Texarkana at a lesser rate, you would do it, wouldn't you?

A. Well, I would have to pay the freight and re-bill the car.

Q. Well, I say, doesn't that force the railroads to take into consideration the sum of these local rates in fixing rates of that sort?

A. Well, they usually do.

Q. Now, for a shipment from some point in Louisiana to a point in Texas, via Texarkana, the same condition would prevail, would it not, as in that case I have illustrated against the Gulf Colorado & Santa Fe?

A. Yes, there are some rates in the Texarkana combination, I presume can be handled that way, but I don't know that they——

Q. I was only asking you if the Texarkana combination does not influence the interstate rates say to Marshall and other points in Northern Texas?

2136 A. Well, there might be a few points right in the vicinity of Texarkana, but as a rule, there is an interstate rate that covers the whole state of Texas.

Q. I know, but you are not answering my question. Doesn't it influence the interstate rate to Marshall and other points?

A. I don't think so.

Q. Are you familiar with the conditions?

A. I used to be.

Q. And you say that is not the case?

A. I don't think so.

Q. Are you familiar with tariff #1 of the Southwestern Tariff Committee?

A. Yes, sir.

Q. Is there not a section of Northern Texas in that tariff that is controlled by the combination?

A. I tried to answer your question on that a while ago and you wouldn't let me. I said there were a few points in the vicinity of Texarkana,—Atlanta, Marshall, Weston and a few other points—unimportant some of them—that they do make less than the Texas rate.

Q. Have you a copy of that tariff?

A. Sure. Yes, sir.

Q. I wish you would bring it up this afternoon.

A. I would like to answer a question that you asked me about this Texarkana rate.

Q. All right.

A. To show that it was not controlled by the State Commission tariff altogther. When the maximum rate #3 was 82 cents
2137 first-class, the first-class from Memphis to Texarkana was a dollar.

Q. Now, what was the maximum rate of 85 cents you spoke of?

A. 82, from anywhere over the state by a single line. So the Texarkana rate could not be governed entirely by the #3 tariff.

Q. Now, you said, as I understand it, at the time the maximum rate in Arkansas was 82 cents the rate from Memphis to Texarkana was——

A. A dollar. I know that is right.

Q. What was the sum of the rates Memphis to Little Rock, plus the rates from Little Rock to Texarkana at that time?

A. Oh, they would be about $1.25, something like that.

Q. Was it practicable for railroads, in view of commercial conditions and other conditions that affected transportation, to put in a rate that would exceed the sum of those two rates that I asked about formerly?

A. Well, it could be done.

Q. I know it could be done. Many absurd things could. But, in practice, was it done?

A. Hardly ever.

Q. Could railroads maintain a system by which they could operate under rates between two given points that were greater than the combination rate from the initial point to the initial point of the combination rate to the destination?

A. They don't do that.

Q. Would shippers assume that without consideration?

A. They don't do it.

2138 Q. That is what I want to know. They don't do it. But on the other hand they make their rates very close together——

A. It is impossible under the tariff existing today to do that.

Q. You say they make the rates very close together?

A. You couldn't ship anything into Little Rock and ship it out of here except by the through rate.

Q. Why is that?

A. Because, as I told you before, they protect the rate by this court tariff.

Q. But upon the Commission tariff before the court tariff was adopted?

A. If they reduce the rate of Memphis to Arkadelphia, in a St. Louis shipment, they maintain the difference between St. Louis and Memphis by reducing the rate from St. Louis to that point. There is no rate out of St. Louis.

Q. And by that method they observe a parity of rates?

A. Yes, sir; between St. Louis, Memphis and Texarkana, or Arkadelphia.

Q. Now, if there were a change made in the rate between Texarkana, Hope or Fulton a corresponding change would be made in the rate between St. Louis and Memphis?

A. Certainly, they would have to come to that.

Q. Now, would that be true between St. Louis and Texarkana?

A. Yes, with a little difference.

Q. What would be the difference?

A. Well, I don't know. I have never considered it.

Q. Well, to go back to the matter I called your attention to a while ago, I will ask you again, with reference to the actual,
2139 practical working of transportation rates, if a change were made by which there was a material reduction in the rates from, say, St. Louis to Hope and no change made in the Texarkana rate, as a result of which the rate from St. Louis to Texarkana would be considerably higher, would that sort of arrangement work out?

A. Well, the Iron Mountain has a rate to Fulton, nine miles north of Texarkana, that is higher than the Texarkana rate.

Q. You mean from St. Louis to Fulton?

A. Yes, sir.

Q. How does that compare with the rate from St. Louis to Little Rock plus the rate from Little Rock to Fulton?

A. Well, there are no combinations from Little Rock, no, from St. Louis to Little Rock that can beat the through rate.

Q. I want to ask you if that statement you made a while ago as to the effect of reduction does not apply generally in the adjustment of rates?

A. Yes, sir. You can hardly reduce from one point without affecting another, or advance the rate from one point without affecting another.

Q. Are you familiar with the rate situation in this state generally?

A. Yes, sir; I think so.

Q. Now do you know what is the rule,—We will say that the Kansas City Southern has, as to preserving the relation between rates as to intermediate places, say Hope and Texarkana,—whether they would carry goods cheaper to Hope than to Texarkana?

2140 A. Well, the Kansas City Southern has the reputation of keeping the Texarkana rate in line with all points. In fact, the time that this rate—on sugar, I mean—was in effect only over

the Kansas City Southern. I think that is the line that published the combination.

Q. If that is true on the Kansas City Southern or any other line or road on rates to intermediate points—between Texarkana and other points—would it not force railroads to regard the Commission rates to points in northern Texas?

A. Well, it doesn't force them to do it, but they usually do.

Q. They do it, however?

A. Yes, sir.

Q. Is that not a practice that prevails pretty generally in the adjustment of railroad rates?

A. That prevails at common points.

Q. What effect would the reduction in state rates between given points, to what extent would it impair or destroy the parity as between state rates and interstate rates—what effect would it have upon the interstate rate in the same territory?

A. Do you mean a reduction in the state rate?

Q. Yes.

A. Why, it would, of course, reduce the interstate rate; that is, if they followed the line they have been following ever since the Commission went into effect.

Q. Well, that is what I speak of.

A. Yes, sir.

2141 Q. Do you know how rates on grain from Kansas City to points south of Pine Bluff are fixed?

A. In Arkansas?

Q. Yes.

A. I haven't a grain tariff with me, but I believe south of Pine Bluff, I think the rate is the same at Pine Bluff.

Q. I will ask you if it is not the rate from Kansas City to Pine Bluff, plus the local rate out of Pine Bluff to the destination, take Rison for instance?

A. That is on the Cotton Belt; they make those rates on a certain fixed differential over the Pine Bluff rate, on through tariffs.

Q. The question I want to ask you, take Rison for instance, that is a station on the Cotton Belt line?

A. Yes.

Q. If the rate to that point is not the rate between Kansas City and Pine Bluff, plus the local from Pine Bluff to Rison?

A. You mean this local court tariff.

Q. Whatever the local is—take the commission tariff.

A. That may be true; I presume they make a rate that way, if the local was less than the fixed differential which they usually use in making those through grain rates.

Q. Isn't that true all along on the Cotton Belt line?

A. I guess it is; I don't know; it is not true on the Iron Mountain though.

Q. Have you produced the Western Committee Tariff #1, that I asked you for this morning?

A. That is No. 1-B; I think that is the one that is in

2142 effect now.

Q. Will you take the tariff and state what points in North-

ern Texas the rate described by the Texarkana combination reaches, that I asked you about this morning?

A. I could not tell unless I had the Texas Commission tariff; I do not know whether this is a combination of the locals or not; there is a difference here to some of those near-by points on the commodities, but very little on the classes.

Q. What are the points?

A. Atlanta, Jefferson and Marshall; the difference in the class rate is only two cents between common points.

Q. I will take the commodity rates, you say Atlanta, Jefferson, Marshall and Waskon and points taking the same rates as those, those are large business centers?

A. I wouldn't consider them so.

Q. Aren't Jefferson and Marshall?

A. They are pretty good little towns; they are not wholesale towns.

Q. What are the commodity rates; is there not a large list of commodities there that take that rate?

A. Yes, sir.

Q. How many sheets of that tariff do they cover?

A. They don't cover very many, about six or seven pages; there is a difference between those commodity rates, and the common point, Texas common point rates.

Q. What is the difference?

A. On agricultural implements, the first item I see here,
2143 is 12 cents to Atlanta, and there is only four cents on Jefferson; 1 cent on Marshall, and Waskon, that is the same; the greatest difference appears to be at Atlanta, and points common therewith.

Q. What are the relative distance of those places; the difference grows less as the distance increases?

A. I think Atlanta is the nearest point to Texarkana.

Q. Doesn't the difference grow less as the distance increases?

A. Yes.

Q. Doesn't that show it is based on the Texarkana combination?

A. It might be that, or it might be the grading that led up to the common point rate, that might be the basis for it.

Q. What do you mean by the common point rate?

A. Zone rate; it applies all over Texas.

Q. Isn't that a different rate from the zone rate?

A. Yes, sir.

Q. And that conforms more nearly to the Texarkana combinations?

A. I don't know whether that is based on Texarkana combinations or not; there must be some basis, but I don't know whether it is the commission tariff that applies, plus the Texarkana rate or not; I would have to check a few to give you that information; it would have to be a pretty low rate from Texarkana to Atlanta; only eleven cents, and I hardly think the commission rate carries as low a rate as that.

Q. These schedules we are talking about, represent a pretty large number of commodities, don't they?

A. Yes.

2144 Q. And a heavy traffic movement?

A. I expect there are some items in there that there is a pretty heavy traffic on.

Q. Did you say you could figure out the rates and tell me definitely whether it is the Texarkana combination or not?

A. Certainly.

Q. Will you do that?

A. It will take me several hours.

Q. Will you do it and furnish me the information later?

A. Yes; if it is the Texarkana combination, I can give it to you by making the figures.

Q. You would have to have the Texas tariff to base that on?

A. I have that Texas Commission tariff; it does not stand to reason that it would be a combination though; you mean you want me to take the rates from Texarkana on those commodities and add the commission tariff and see the sums of the two?

Q. Yes. How do the rates to common points which you have referred to in your testimony in this case, compare with the local rates which I suppose would be governed by distance tariffs?

A. The mileage?

Q. Yes, which are the lower?

A. Some of the common points are based—take Little Rock for instance, the rates are somewhat higher than the court tariff.

Q. I am not speaking about the court tariff.

A. Well the commission then.

2145 Q. I mean usually, as a rule, how do the rates at common points compare with mileage rates?

A. They never have considered them in the making of rates; those through rates to the junction of common points have not been based on the intrastate rate in hardly any instance.

Q. When I say common points, I mean jobbing centers, like Little Rock.

A. Yes.

Q. What I want to get at is your knowledge, if you have any knowledge, as to which is usually as a rule the lower rate, that is the jobbing point or the mileage rate?

A. I would like to have a little time, I would have to look a little bit before I can answer that question.

Q. I want to direct my question to a period covering along about when the Commission tariff was in force, from 1900 to 1906 or 1907; to give you a sample of what I mean, take wire nails to Little Rock; how do the rates on that commodity from Memphis to Little Rock, which is the common point, compare with the mileage scale.

A. Practically the same, except that this tariff extends the rate for distances of 150 miles; the rate in this tariff, in this court tariff.

Q. I am not speaking of the court tariff.

A. This is not the court tariff; this is #3, the tariff that was enjoined, the rate in that tariff between Memphis and Little Rock is the

same as the rate today from Memphis to Little Rock, that is in the carload rate.

Q. What was the rate from Memphis to Little Rock on wire nails under this distance tariff #2 of the State Commission?

2146 A. Well, the rates were not made on this tariff #2, at the time the first tariff was issued.

Q. I perhaps put that question wrong; what was the mileage scale on that commodity, for a distance of 133 miles, under distance tariff #2?

A. I have #3, I don't think there was any change in it.

Q. What was #3?

A. 13 cents.

Q. What was it from 1900 to 1906, the rate from Memphis to Little Rock?

A. 10 cents.

Q. That is a difference of 3 cents?

A. Yes, sir.

Q. That illustrates the information that I want, as to how the scale ran; how did it run usually, which was the higher rate usually, the interstate rates to common points, or the intrastate mileage scale?

A. Some of the interstate rates were lower and some were higher.

Q. On what commodities were the interstate rates to common points higher than the intrastate mileage rates, rates on the mileage scale?

A. The first commodity in here is produce; the interstate rate at the time this was in effect—was issued, from Memphis to Little Rock, was 16 cents. This is 12,—the mileage scale.

Q. How was it from St. Louis?

2147 A. St. Louis was the differential higher, about eight cents, six cents may be.

Q. On merchandise what was the difference?

A. The rates from St. Louis were not predicated on this tariff at all.

Q. On Memphis how was it?

A. I just say there was a difference of four cents a hundred; the interstate rate was that much higher.

Q. You stated this morning, in speaking of jobbing rates, that some very low rates were put in; I understood you to say, for the purpose of building up trade centers?

A. That was the primary object of the railroad people.

Q. What was the policy of the state commission, in fixing their rates?

A. I am sure I couldn't tell you.

Mr. HILL:

Q. You were not a member were you?

A. No.

Mr. MOORE:

Q. You had occasion to give a good deal of attention to the commission's rates during that period?

A. Yes, sir.

Q. From your experience and judgment, growing out of your occupation, what would you say in answer to that question, I mean as to the effect of the commission rates?

A. I stated this morning, it had the effect of reducing the intrastate rates, incidentally, the interstate.

Q. In what way did it reduce the interstate rates?

2148 A. My reason of the contract they had at Memphis.

Q. What was that contract?

A. That contract was that for a certain consideration, that is the vacation of streets and alleys, they agreed to forever maintain the same rates from Bridge Junction or West Memphis, from Memphis proper to points in Arkansas.

Q. The Memphis rate was made the basis through the medium of a differential, of the interstate rates from St. Louis and New Orleans, and other large jobbing centers, into Arkansas?

A. Yes, sir, that is true.

Q. Speaking of it broadly, in the aggregate, I will ask you if the interstate rates to common points from jobbing centers in Arkansas, were not, during the period that the Commission rates were in force, lower than the mileage rates and the rates upon the mileage scale?

A. Not altogether. Some of them were higher and some were lower.

Q. I mean in the aggregate.

A. In the aggregate, they may have been about the same.

Q. I asked you awhile ago to name some of the commodities in which the interstate rates to common points were higher, and you mentioned produce, I wish you would mention any others that you can?

A. Bagging and ties; my recollection is there was a difference of about 2 cents between Memphis and Little Rock.

Q. Which was the higher?

A. The interstate rate.

Q. What else?

2149 A. On canned goods, the state rate was higher than the interstate rate.

Q. It is those cases in which the interstate rate was the higher that I want you to state.

A. There are very few of those; grain and grain products are not considered in this tariff at all.

Mr. HILL:

Q. You didn't consider that because the grain and grain products moved under interstate rates?

A. Yes, sir, as I have stated before, the rate on iron and steel articles was higher in this tariff than the interstate rate, 2 cents a hundred.

Mr. MOORE:

Q. Have you found any other commodity in which the rate was higher?

A. There was a reduction on petroleum; that is, this tariff was lower than the interstate; I am not clear as to just what the difference was; there was a difference.

Q. That is the third; is there any other?

A. I think not; there were a good many carried in the common point tariff that are not in this.

Q. Have you examined the supplemental tariff put out by the Commission on petroleum; I think they raised that?

A. Yes.

Q. Are you speaking from the supplement?

A. I am speaking of this tariff made in 1908; I think that carried all the changes; there were some less than carload rates made in this tariff, which are not carried in the other.

2150 Q. Didn't the Commission in reality very materially lower the rate on petroleum products, after that rate you have before you?

A. I believe they did; I take it this was the rate that was in effect at the time the injunction proceeding was had, because it is #3, dated 1908; I presume that is the lowest rate and the last rate.

Q. State what the relative rates were?

A. That I can't say; this may be a rate of 13 cents on the mileage scale for the distance between Little Rock and Memphis; there is a difference there of about three or four cents.

Mr. HILL:

Q. Which is the highest?

A. The interstate rate was the higher.

Mr. MOORE:

Q. Just state what each rate was, what the interstate rate was, and what the state rate was?

A. I haven't got the Memphis tariff: (After looking at tariff handed him) It makes a difference of 2½ cents a hundred; it is higher on interstate than state for an equal distance.

Q. What do you say was the rate from Memphis and the state rate on wire nails?

A. Prior to 1907, the rate on nails and wire from Memphis to Little Rock was 10 cents.

Q. What was it for the same distance?

A. It was 13.

Q. What was it from St. Louis?

2151 A. It was 20; no, it was 18; that rate was advanced 5 cents in 1907, the interstate rate.

Q. Prior to 1907, what was it?

A. It was 18 cents from St. Louis and 10 cents from Memphis.

Q. That was prior to the change made in February, 1907?

A. Yes, sir.

Q. What was the change in 1907?

A. 5 cents a hundred increase.

Q. From which point?

A. Both points.

Q. Aren't you mistaken about it being the same from both points, wasn't it 3 cents from Memphis and 5 from St. Louis?

A. Yes, that is right; it was 3 cents from Memphis and 5 from St. Louis; it was 18 cents to St. Louis and they raised it to 23; it was ten to Memphis and they advanced it to 13.

Q. Did you have any connection or participate in any way, in the increase in interstate rates in February, 1907, further than to apply the rates?

A. I was at that time, with the freight bureau.

Q. You have no connection with that rate?

A. Not with the making of it.

Q. You don't know the reasons that the traffic men who participated in making that, had for that raise?

A. Yes.

Q. What was it?

A. They said they needed the money.

Q. That the rates were too low?

A. They didn't say that; they said that they had to in-
2152 crease their rates.

Q. Did they tell you why they had to increase them?

A. They said they had to have more revenue.

Q. Didn't they also say to you that the change ought to be made for the purpose of adjusting the interstate rates to the state rates for equal distances?

A. There was nothing said about that at all.

Q. Who did you confer with?

A. There was a representative of the Cotton Belt and Iron Mountain——

Q. Give their names?

A. Mr. Watson was present and Mr. Stith of the Iron Mountain and Mr. Farrell, I believe, of the Cotton Belt, and Mr. Park—about the same officials that are here with the roads now were there—Mr. Johnson of the Rock Island was there.

Q. You stated there was a raise of about 15% in inter-state rates at that time?

A. Yes, sir.

Q. Do you state that as a matter of fact or simply as your idea?

A. I made the figures; I know what it was; the average was about 15 or 16%; some were 20, some 25, and some 5; the average was about 15%.

Q. What class of commodities was the highest rate made on?

A. It covered all classes.

Q. The highest did not cover all classes did it?

A. I say it covered all commodities.

Q. I asked you on what particular commodities the highest
2153 rate was made?

A. They raised it on everything.

Q. You said it ran from 5 to 25%; state what that was in figures?

A. 5 cents a hundred.

Q. What was it from Memphis?

A. Memphis was increased about the same proportion.

Q. What I asked you was what was the original and what was the larger rate?

A. It was first 10, and they raised it to 13, and then some of the heavier groceries, sugar, I think was advanced 10%—2 cents a hundred; sugar and molasses; there were other increases aside from the rates, by increasing the weights.

Q. I believe you stated this morning that the commission tariff cancelled prior tariffs that had been put in force by the railroads?

A. Yes, intrastate tariffs; I think the railroads voluntarily cancelled all these rates out.

Q. How did the commission rates compare with the special rates to jobbing centers on the special commodities such as you mentioned this morning, coal, and grain and commodities of that sort,—lumber?

A. That was all practically interstate business; the cotton seed rate was reduced in some instances, and in some increased, by reason of this tariff.

Q. How was it on coal?

A. Well, the coal rates were reduced some.

Q. Can you tell me how many commodities, if there were any at all, upon which the rates were not reduced by the com-
2154 mission tariff, below the tariffs that had theretofore been in force?

A. I could not.

Q. I will ask you, if as a whole, the rates were not reduced on all commodities?

A. Yes, in less than carloads they were, not in carloads, but in less than carloads they were reduced.

Q. And didn't the commission rates practically supersede the previously existing special rates, by reason of the fact that the commission rates were the lower, and it necessarily operated to do away with the prior rates?

A. I don't remember any jobbing tariffs that were kept in effect, or special tariffs that were kept in effect, very long after this tariff went in.

Q. And the reason of that was that the Commission tariff reduced the rates wasn't it?

A. As a rule it did; that is, understand me now when I say it did, it is on the less than carload commodities; carloads were, in many instances, higher than the railroad rates.

Q. Were the special rates put in force by the railroads regarded by you as high or low rates?

A. During the period that they were made, it was thought necessary to make them; they were largely experimental.

Q. In what sense?

A. The railroads wanted to take care of the business, but the traffic from the jobbing centers, like a great many other rates, it was pretty hard to figure out, just what you wanted to do, and they had to experiment with it.

2155 Q. Isn't it a fact that many of those rates were made for the purpose of building up and developing trade centers of the state, and weren't they made exceptionally low for that reason?

A. That was the object unquestionably.

Q. And to facilitate that object, the rates were made very low in many instances?

A. I don't think that they were any too low at that time.

Q. When you say you don't think they were any too low, you mean in reference to commercial conditions of the country?

A. Yes, sir, as they existed at that time.

Q. And when you say that, you speak of the fact that the country was new and needed developing?

A. Yes, sir, sparsely settled, and the roads favored the outside points until the time that these jobbing centers—until the merchants began opening up wholesale houses in the state; that is customary everywhere.

Q. Then it became their policy to build up local trading centers?

A. Yes, sir.

Q. Did you regard at the time this first distance tariff was put in, in 1900, did you regard the rates established by the commission as reasonable and fair, and just to the railroad?

A. I was working for a railroad at that time.

Q. I am asking you what was your view about that?

Mr. HILL: I think he has answered that; I don't think that is a fair question, Judge Dooley.

2156 Mr. MOORE:

Q. You have already testified, I think, that you didn't approve of the mileage scale adopted by the commission?

A. I don't think it is a proper basis.

Q. Wasn't that the foundation of the fabric of rates that the Commission built up?

A. When I say that, I don't think it should be the basis for making through rates for long distances, or interstate rates; it is absolutely necessary to have a mileage scale somewhere, and in some way, because you cannot cover every point with terminal tariffs.

Q. What you objected to in the commission schedule was the generality of the mileage scale they adopted?

A. Yes, sir.

Q. If that was faulty, it affected the entire fabric they built upon it, didn't it?

A. It affected all rates predicated on it, of course; I would like to qualify that, by saying that I think some rates that followed the commission rates were unnecessary.

Q. Do you know whether any proposition was ever made to the Railroad Commission to increase the rates?

A. Informally, yes, sir.

Q. What was done in that respect?

A. I was one of the parties that made a suggestion to them.

Q. When was that?

A. That was when Judge Hudgins was chairman of the commission; I don't remember the date.

Q. What was the suggestion, please.

2157 Mr. HILL: You are making this witness your witness now.

Mr. MOORE: That is all right, judge.

(WITNESS:) The gentleman and myself prepared a tariff, a mileage tariff, made on what we thought,—and in fact he was a scientific tariff man,—was on a broader basis; that is, not so much as to figures, but it was lined up better, more like a tariff; it made some reductions, and it made some advances. Judge Hudgins said that the Commission would not entertain it if it meant an increase in these rates; it was never presented to the commission except informally.

Q. Judge Hudgins was Chairman of the Commission at that time?

A. Yes; he said they didn't care to entertain anything that would change their tariff.

Q. By whom is this "Southwestern Lines Tariff" prepared; in order to make it compare with the language used heretofore, the tariff prepared by the Southwestern Committee; who is that committee, of whom is it composed?

A. All of the Southwestern railroads.

Q. You had no connection with that committee?

A. Not since I left the railroad.

Q. Who prepared the schedule of rates put in by the railroad companies, how are they prepared, and who does it?

A. Unless they have changed the method, the railroad designates a representative to attend these meetings; they meet once
2158 a month or oftener, if necessary, and they check out these rates and instruct the chairman to issue them.

Q. What is done then?

A. He issues them.

Q. Who issues them?

A. They are issued in this tariff.

Q. That tariff is then put in the hands of the representative who applied them, the traffic manager?

A. Yes, sir.

Q. When you were division freight agent, did you have any connection with the meeting of the committee and the making of the rates, or was it your duty to apply them to the business that was in your jurisdiction?

A. It was my duty to apply them; I have attended some of these meetings.

Q. What meetings did you attend?

A. Several in St. Louis, when Mr. Cale was chairman.

Q. How long ago was that?

A. Six or seven years.

Q. Were those general meet[illegible]s of the representatives of different roads, or was it a meeting of the officials of the Iron Mountain road?

A. All the Southwestern lines were represented.

Q. Were the differentials that you have referred to in this case, fixed at any of the meetings you ever attended?

A. Yes, but it has been so long ago I have almost forgotten it; those differentials were fixed at a meeting in the Southern Hotel, twenty years ago; I don't think they have ever been
2159 changed; if they have, it is not a very material change; there has been no radical change in any of them.

Q. Are you familiar with the proceedings and work of the Western Classification committee?

A. Only in a general way; I have attended one or two meetings, not as a railroad representative, but as a shipper.

Q. When did you attend those meetings?

A. I attended two meetings, both at Hot Springs.

Q. What year?

A. The year they met there, I think it was in 1906.

Q. For what purpose did you attend the meeting?

A. I wanted a reduction in several commodities in the classification.

Q. Why did you want that?

A. Because I felt that the classification on certain articles was unjust.

Q. I wish you would explain just in a few words, what the complaint was, and what it was predicated upon.

A. I can't mention the articles now, but I think some were iron and steel articles, and some other commodities, probably grocery commodities; you have to file an application there, setting forth the reasons and all about it, and then they give you a hearing if you are lucky enough to get in.

Q. Did the classification affect the rates upon the commodities you were complaining about?

A. Yes, indeed; the classification affects every rate, unless it is covered by a special commodity that takes it out of the classi-
2160 fication.

Q. Does the classification prescribed by that committee obtain in the classification made by the State Commission?

A. Largely so; they have an exception to it which is probably in the tariff.

Q. I believe you said you did not present your scheme for changing the rates to the Commission, because Judge Hudgins, the chairman, told you that it would not be considered?

A. We just discussed it with him about five minutes, and he said he didn't care to take it up, or take up any question about changing the rates.

Q. That was the reason you didn't press it any further?

A. Yes; one of the railroads objected to it; we submitted it to one of the lines and he wouldn't give us any help on it.

Q. You spoke something this morning in reference to the causes that governed in fixing rates; are railroads different in that respect from other industries, isn't it necessary that they have some knowledge of the cost of the service they render, in order that they might

be able to fix their compensation, so as to have an assurance of earning a profit on their services and investment?

A. Yes, it should be that way, and I presume, in a general way, they try to do that.

Q. Did you ever know of a business, large or small, that was conducted successfully, in which the output of the business was not sold with reference to the cost of its production?

2161 A. I consider that the railroad corporations in that respect are entirely different from any other kind of business.

Q. Can any business be conducted successfully unless it sells its wares upon a basis that will enable it to make something above the cost of producing it?

A. Of course not.

Q. Isn't that true of railroads, the same as any other enterprise?

A. They are trying to make money, there is no question about that.

Q. Can they conduct their business intelligently with reference to results, unless they fix the price upon what they have to sell with some reference to the cost of producing it; isn't that true just as well with railroads as with any other industry?

A. I don't think so; I don't think they can calculate it very closely.

Q. If the cost of transportation is not an element that it is absolutely essential that railroads should consider, must they not consider it if they conduct their business successfully?

A. Of course, they must do that.

Q. You do not mean to say that rates are fixed without any reference at all to the cost of service?

A. About half of them are.

Q. How is it with the other half?

A. I don't see how they can figure a rate at all, on the cost of——

Q. Let me ask you, I believe you said awhile ago that the

2162 rates depended upon the classification; does the element of cost enter into the consideration of those persons who are charged with the duty of making the classification?

A. No, sir; in a general way, they make these classifications—they are inconsistent; they will classify a commodity, one of the very cheapest commodities, perhaps, which costs the smallest sum to handle, they will put it away up in a high rate.

Q. I will ask you, the classification given say to iron, with reference to the rate, that is fixed upon it, how does it compare with the classification of baskets?

A. There is no comparison in those things.

Q. What is the difference?

A. One is low and the other is high.

Q. Why do they make that difference?

A. They make that difference on account of—they always figure that baskets and bulky stuff, they figure that according to the space it occupies.

Q. The space that an article occupies is one element that is considered?

A. That is one,—it must be.

Q. Does the weight enter into it, is that an element that is considered at all, in classifying it?

A. I don't think so.

Q. Would they put pig iron in the same class as they would feathers?

A. I don't think they would; feathers would take more room than pig iron.

2163 Q. It would not weigh so much?

A. They make the rate sufficiently high to take care of that.

Q. Does the danger of injury and the value of the articles transported have any influence at all in the classification?

A. Yes, some.

Q. Why?

A. The value of an article is sometimes considered, and sometimes it is not.

Q. Why do they consider it?

A. Sometimes they do and sometimes they do not.

Q. Why do they consider it in the cases where they do?

A. They just forgot about it, I reckon.

Q. They just consider it from forgetfulness?

A. They don't figure it at all.

Q. Take a carload of pianos, and compare that with a carload of another commodity, that would be about the same weight, but would not be worth one-tenth in value of the pianos, would they class them the same way?

A. I can illustrate that to you by stating, that a carload of pianos would not be of any greater value than a carload of axes, yet they can get the weight on the axes, but thereby get a greater amount of revenue than they would on a carload of pianos, although the rate might be the same.

Q. How do you classify them?

A. Along with other first class freight.

2164 Q. Take fragile glass, valuable and fragile glass, take glassware which is very valuable, say Dresden china and crockery, is there any difference in the classification made on account of its value and fragility.

A. Yes, they usually limited the value in the bill of lading.

Q. Why is that?

A. Because they don't want to assume the risk.

Q. I am asking you about the classification, with reference to the rate put upon it.

A. I don't say they don't consider them sometimes, but as a rule they are inconsistent; some ought to be classed higher than they are and some ought to be lower.

Q. Have you ever been present and attended a meeting of the Western Classification committee?

A. I am a shipper and not permitted to be there; they do these things in closed chambers.

Q. You don't know from your own personal knowledge, what things they consider?

A. Yes, I do, because I have been using classifications for 25 years, and I know practically how they are made, and the matters they consider, because I have had a great deal of correspondence during my service with the railroad, and a great deal since with the classification committee.

Q. Do you know Mr. Becker, chairman of the Western Classification Committee?

A. Yes, sir.

Q. Do you know how long he has been engaged in that service?

A. He is an old railroad man, traffic man.

Q. He has been for a long time in that service?

A. I don't know that he has been with the Western Classi-
2165 fication Committee very long.

Q. You don't know how long he has been there?

A. Four or five years, I think; you understand there are three classifications in this country, and none of them agree.

Q. Yes, I know, but those classifications cover different territory, don't they?

A. Yes.

Q. But don't all of them make their classifications with reference to bulky and weighty articles and value and considerations of that sort?

A. I expect they try to do that.

Q. And it is just a question of capability as to how nearly they can succeed in doing it?

A. I think a great many of those inconsistencies creep in there by reason of the fact that the people who make these classifications are utterly without experience; some of them have never been out of the City of Chicago.

Q. Isn't it a fact that the subject is one of such large dimensions that it would be very difficult to avoid making some mistakes?

A. Certainly.

Q. You wouldn't say as a general rule, that they don't make their classifications, that as a general rule, the cost of transportation doesn't enter and have its influence with them in placing articles in different classifications?

A. I think a great deal of it is guesswork.

Q. They attempt to guess with reference to the cost of
2166 transportation?

A. Yes.

Q. Your view is caused by your *option* of the experience and capability of the men engaged in the work?

A. I think Mr. Becker is a very competent man.

Q. Would you regard his views with respect?

A. Yes, but he is not infallible.

Q. He has had a better opportunity than you have had to know the theory upon which the committee acts?

A. I don't think so.

Q. Hasn't he been present at their meetings and their deliberations?

A. In a detail way, I would consider he was; I consider any of these railroad gentlemen here, who have come in contact with these classifications daily as I have, would be just as competent to pass upon the classification of an article as Mr. Becker would.

Q. Your duties as division freight agent, I believe you stated awhile ago, were to apply the rates that were issued by those authorized to make them, in the territory that was in your jurisdiction?

A. If I found that the rates that were furnished me, were out of line, or were not in keeping with the conditions I would always notify the people at headquarters.

Q. What conditions do you refer to?

A. Sometimes the tariff was issued, and after you put it in effect, you found it was not the proper rate.

Q. For what reason, what would influence you in determining that it was not a proper rate?

2167 A. The fact that it would not move the business.

Q. That would be one thing?

A. Yes.

Q. If it didn't move the business, you would report that the rate was too high perhaps?

A. Yes.

Q. Suppose it came to your knowledge that a rate that had been put in was so inadequate as to be utterly unremunerative, and it would cost more to transport an article than the rate would yield, what would you do?

A. I never had any experience along that line; if I had I would have called their attention to it.

Q. Why would you have done that?

A. Because I wouldn't want them to haul freight for nothing.

Q. You would do that in consideration of the fact that the cost of service is an element that ought to be considered in determining the rate, wouldn't you?

A. Yes, if it is possible to do such a thing.

Redirect examination.

By Mr. HILL:

Q. When you went to Judge Hudgins with the proposition to reform the tariff, did you accompany it with any statement that the railroads were losing money under the existing tariff?

A. No, there was nothing said about that; we did not make any proposition; we didn't even show him the figures. We

2168 simply mentioned the matter to him informally, asked him if he would consider a revision of that tariff.

Q. You wanted to balance the tariff better than it was balanced, wasn't that the idea principally?

A. Yes, like all tariffs, there were some inconsistencies in it; while

we did not attempt to correct all of those, we thought that it would probably have been more satisfactory.

Q. You thought you would distribute the revenue more scientifically than it was distributed under that tariff?

A. It meant an increase in some things, and a reduction in others.

Q. There was no proposition made to Judge Hudgins at that conference, that the railroads were losing money under this tariff, and should have an increase for that reason?

A. We didn't make any statement of that kind.

Q. You stated one road objected to having these changes made in the tariff, which road was that?

A. It was the Iron Mountain; Mr. W. C. Stith, at that time traffic manager. I had some correspondence with him about it, and while he said it was a move in the right direction, at the same time he said he didn't feel that he cared to take it up.

Q. You referred in answer to a question of Mr. Moore, with reference to that Memphis situation, and if I understood it correctly, it confounded two propositions that I want to get clear; I believe you stated this agreement that was made by the City of Memphis or some parties representing the city, by which
2169 the Iron Mountain got terminal facilities there, was to the effect that the Iron Mountain was to maintain local rates out of Memphis, the same as the commission rates in Arkansas?

A. Yes, whatever rate might be applied in the state, intrastate, it would be followed by a similar rate out of Memphis.

Q. In other words, as you expressed it this morning, it was making Memphis an Arkansas point?

A. Yes.

Q. What only applied to the local rate, and not to the common point rates?

A. No, sir, it only applied to the local points.

Q. Now, Mr. Moore asked those questions practically together as I understood him, and there might have been some confusion there; these arbitraries that you described, based on the Memphis rate, had nothing to do with that agreement about the rates in Memphis did they?

A. You mean these differentials?

Q. Yes.

A. No, that was a matter entirely that affected the interstate rate; it was simply adjusting the rate as between Memphis, St. Louis, New Orleans, Cairo and Kansas City.

Q. That was simply a system of arbitrary differentials that grew up all over the country, and these were the ones affecting this territory?

A. Yes, sir.

Q. These arbitraries and differentials were almost pre-his-
2170 toric in their origin, aren't they?

A. Yes, sir, they simply maintained them; in fact they are bound to do it.

Q. I believe Mr. McPherson put in a schedule or diagram here,

showing that the cost has been an upward factor for a good many years; these arbitraries have remained during all that period of time, during all these years, notwithstanding the cost might have been going up?

A. Those arbitraries—those differentials would not prohibit advancing the rate out of St. Louis, Memphis or any other point; they are just there to maintain the relative difference between these various points.

Q. That would not affect the revenue as a whole, but would just disturb the revenue between these various gate-ways?

A. It wouldn't affect the revenue unless they abolished them entirely.

Q. And they haven't done that?

A. No, sir.

Q. And that would mean an increase in the rate?

A. Yes, sir, from points east of the Mississippi River; the abolishing of the differentials would—well, I don't see how they could abolish them; they are bound to maintain a difference between these points, and they had to fix a basis, which they called a a differential.

2171 Mr. HILL:

Q. Mr. Bragg, coming back to that question that we were discussing this morning of the effect of the sum of the locals on the interstate rate, Mr. Moore inquired of you quite a number of instances where they did and did not affect the rates. I want to know your opinion of the extent of the traffic affected by rates made on the sum of the locals.

Mr. MOORE: I object to that question unless you have Mr. Bragg qualify as to whether or not he knows.

Mr. HILL: Well, he can state whether or not he knows.

The MASTER: He is speaking as an expert is he not?

Mr. HILL: Yes, sir. And I don't know whether he knows or not. I am trying to find out.

The MASTER: Well, then, ask him whether or not he has any knowledge about it.

The WITNESS:

A. I can not approximate how much of the business is handled in that way.

Mr. HILL:

Q. What would be your opinion?

Mr. MOORE: I object. He has just disqualified himself.

2172 The MASTER: Are you asking him as an expert or as having personal knowledge of it?

Mr. HILL: Just as an expert. He has qualified as having had 25 years' experience.

The MASTER: Go ahead and ask him.

Mr. HILL:

Q. Now, that is the question. Could you give your opinion of it, Mr. Bragg?

A. I can give my personal opinion about it just as I have said before. I couldn't give any definite figures on it at all.

Q. Well, that is just what I am asking, is your opinion. I couldn't assume that you could give a calculation on it.

Mr. MOORE: Now, I want to ask a question based on that. Would your opinion be based on information or would it be merely a guess?

The WITNESS:

A. Well, partly information and partly guess.

Mr. MOORE: Then I object to it.

The MASTER: Answer it.

Mr. MOORE:

Q. What information have you?

The WITNESS:

A. Well, there has been some business of that kind
2173 handled here, but not recently. That, of course, I could speak about, but that was very small.

Mr. HILL:

Q. Well now, will you give an answer to the question? What would be your opinion?

A. I think it would be a very small percentage of the business.

Q. Are you familiar with the system of making rates to Texas common points?

A. Only in a general way.

Q. Do you know whether the rates from sea board territory to Texas common points through St. Louis or Memphis have been increased or decreased in the last two or three years?

A. To the best of my recollection all the rates in Texas have been increased.

Q. Do you know whether it is a part of that common point system that the rates to Galveston are supposed to be the same,—from Galveston to Texas common points, are supposed to be relatively the same?

A. Do you mean from the sea board to Galveston or to interior common points?

Q. No, I mean from Galveston to interior common points.

A. I don't know much about that situation. I think they carry some tariffs out of Galveston into Texas points, but just what the basis of them are I don't know.

Q. Do you know whether those Galveston rates to Texas points have been increased or decreased while this increase through St. Louis has been going on?

A. No, I don't. They have a common disturbance there
2174 once in a while, but I haven't kept up with it.

Q. In speaking of this question of the cost of the service,

which is supposed to be considered when rates are made, do you know whether the railroads have any cost accounting system by which they can determine the costs on any given commodities?

A. No, I don't.

Q. You never knew of any such statistics being used while you were in the service?

A. I wouldn't have known of it. That is generally a matter of the accounting department.

Q. You are not familiar with that?

A. No.

Q. Now, I understand your testimony about the classification is that, while the committees are supposed to take into consideration bulk and space and value and risk and things of that kind, that the result of their work is full of inconsistencies where those considerations are ignored. Isn't that about the effect of your testimony about that?

Mr. MOORE: I object to that.

Mr. HILL: I think that is legitimate.

The MASTER: Answer it.

The WITNESS:

A. That has been my experience.

Mr. HILL:

Q. You have had pretty intimate experience with the
2175 Western Classification too, have you not?

A. Yes, I have been handling it a long time.

Q. Mr. Moore brought out that you had been attending some meetings of the Western Classification. Did they give you a hearing on your matters?

A. No, sir.

Q. Kind of a hard crowd to get in to?

A. Well, it is usually out horseback riding and a few clerks do the work.

Q. Have a pretty good time down there, don't they?

A. Yes, they usually do. Incidentally a few games of poker.

Q. Are those meetings attended very generally by the intrastate shippers?

A. Oh, they are always besieged principally by manufacturers and people who are sometimes merchants—generally manufacturers though.

Q. Men that have very large shipping interests go down and have their meetings with them?

A. Well, they go down there and apply for changes in weight or rate or something of that sort.

Q. They go there and discuss changes in weight or *or* bulk and the rates as it refers to manufactured articles?

A. The rate; that is, the Classification sometimes fixes the *the* weight or rate on manufactured goods that become prohibitive perhaps, or with some other point that has the same goods possibly in a

territory covered by some other classification. They are get-
2176 ting around to as nearly perfect as they can. It is a good deal better than it used to be.

Q. Are you familiar with the Texas exceptions to the Western Classification?

A. Yes, sir.

Q. What is the extent of that? I don't mean in detail, but just generally speaking?

A. Why, they have the same thing that is applicable to Louisiana, Oklahoma and Arkansas.

Q. That is published by the railroads,—those exceptions?

A. That is published. In fact, it is advanced by the railroads, those exceptions.

Q. That is, where the railroads change those classifications by meeting those exceptions?

A. Yes. They don't go to the chairman of the classification but through themselves.

Q. Through the Southwestern Lines Committee?

A. Yes, sir; independently of the classification committee.

Q. For what purpose is that done?

A. Well, it is to cover up and account for inconsistencies in this Western Classification.

Mr. MOORE:

Q. Doesn't it grow largely out of conditions as local to that territory?

A. Well, that is true; yes.

Mr. HILL:

Q. There is a large volume of business out of Arkansas in the Texas classification to those points?

A. Yes, sir.

2177 Q. How is that?

A. Yes. You mean by the Iron Mountain?

Q. Well, no, my question is general. They apply to shipments out of St. Louis?

A. Yes, sir, those exceptions apply?

Q. And the traffic passing from St. Louis to the Texas common points would be moving under a classification different from those fixed by the Western Classification?

A. Yes, sir; everything that is not covered by that classification.

Q. Now, take a shipment moving from St. Louis to Texarkana and an interior shipment moving from St. Louis to some common point just beyond Texarkana, one of those shipments would move under the Western Classification and the other under the exception to it, would it not?

A. No, one would move,——

Q. This Texarkana tariff is governed by the Arkansas exceptions is it not——

A. If so, they would both be governed by that Texas exception.

Q. I was under the impression that that Arkansas exception applied.

A. Both tariffs are governed by the same exceptions.

Q. What tariffs are you referring to?

A. Those to Texas common points and those to Texarkana proper.

Q. Well, Texarkana is governed by Texas common point exceptions, isn't it?

A. Yes.

Q. Well, take it to Little Rock.

A. Little Rock is governed by the same exceptions, but they
2178 are applicable on the Arkansas tariff, interstate.

Q. Well, suppose two carloads of freight come out of St. Louis of the same kind; one goes to Hope, Arkansas, and the other to Texarkana. One moves under one classification and the other under the other classification?

A. If they are not covered by the commodity rate.

Q. Yes. I am taking some commodity not covered by the Texas exceptions.

A. Most all freight moving into these big centers is covered by commodity rate,—most all carload freight.

Mr. MOORE:

Q. Is there any difference in these exceptions that would obtain in Arkansas and Texas?

A. I think there is some, not much.

Q. Any that is material?

A. I don't think there is anything very material. I think there is more of them in the Texas than in the Arkansas exceptions, and practically——

Q. Practically about the same?

A. I think so.

Mr. HILL:

Q. Are the Texas exceptions governed by reason of the water conditions at Galveston?

A. I don't know.

Mr. MOORE:

Q. Mr. Bragg, your attention was called on re-direct examination to an exhibit filed in this case by Mr. McPherson showing an increase in the cost in the expense of transportation. Are you familiar with the increase that has occurred since 1900 in the cost of labor,
2179 material and supplies that enter into the transportation and the maintenance of railroads?

A. Only in a general way.

Q. You have no definite information?

A. No.

Q. You know, do you, that, take from 1900 up to 1908, there had been a very material, very large increase in the cost of everything that entered into the cost of transportation, don't you?

A. Well, I have heard that the cost of material going into construction had increased very materially.

Q. Did you ever hear that the cost of labor had increased any, to a very great extent?

A. Well, no.

Q. I believe you stated this morning there was at least 20%, in the aggregate, reduction in the rates fixed by the Commission below those that had been in force previous to the time they issue their schedule?

A. I don't remember whether I stated that. Believe you asked that question, and I told you possibly it was right.

Q. Has there been any material increase—was there between the date of the adoption of the Commissions's tariff in 1900, and the adoption of distance tariff #3 in June, 1908, and material increase in rate?

A. State rates?

Q. Yes.

A. Well, there had been no increase, I know of except this court tariff.

2180 Q. That was before the court tariff took effect?

A. Do you mean this tariff?

Q. Yes?

A. I can't say.

Q. Just state is it not a fact in the aggregate that the rates were not increased by the Commission from the time they established their first tariff?

A. No, I don't think there have been any material changes. I mean down to June, 1908. There were some changes made now and then but I can't tell you exactly what they were, without having the other tariff here to check against.

Q. Well, the secretary of the Commission has testified about that, and shown there was no reduction in the rates. Now what I want to ask you is this: You know there has been a very large increase in the cost of production of all commodities in common use in the country, and that all manufacturing and industrials,—that the cost of operating all industrial plants in the country has increased materially in the last 10 years?

A. I know the cost of living has increased.

Q. Well, hasn't the cost of manufacturing increased, in labor and in the cost of material that enter into manufactured articles?

A. I would imagine there has been some.

Q. Is there not also a corresponding increase in the price at which the output of the industrial concern have been consummated? Is that not what has increased the cost of living?

A. Lumber, I think: that is, the forest product, has increased. I can't say as to steel rails and things of that kind, because I don't know.

2181 Mr. HILL:

Q. While this increase in some lines has been going on, have not the facilities of the railroad to carry freight cheaper also increased?

A. Oh, unquestionably. Unquestionably they are seeking to do that all the time.

Q. In what way have they cheapened the cost of carrying freight and passengers?

A. Larger tonnage in trains, re-advancing freight rate and interstate rates.

Q. What about the increase size of the car?

A. Well, that is an increase of tonnage. Over the Iron Mountain I know of a time when 18 and 15 10-ton car was a train load to Texarkana. Now they average 50, I think, with an average of 20 tons to the car.

Q. They have reduced the grades matterially too, have they not?

A. They have reduced the grades considerably, in many instances.

Q. And straightened the curves?

A. Yes, sir, of course, they had to do that to pull bigger trains, I don't think though the train crew wages now are very much different than 10 years ago, but they do double the service.

Q. Then while there has been some difference in some direction there has been a corresponding increase in others, has there not. What is your opinion as to the comparative cost of hauling freight today with 10 years ago?

A. Well, I wouldn't like to answer that question. I have never examined any figures on it.

2182 Mr. MOORE:

Q. Just one question, Mr. Bragg: Have you any ideal what it cost the railroad company to produce these increased facilities in the transportation of freight, to get larger cars, reduce the grades, and streighten out the curves?

A. Oh, yes it cost something.

Q. Cost a good deal doesn't it, millions of dollars?

A. I expect, but in the mean time they have earned more.

Witness excused.

2183 F. P. JOHNSON, being recalled, testified as follows:

Mr. HILL:

Q. Some questions have been asked you heretofore about the terminal facilities in Fort Smith. I don't believe it has — made quite clear in your testimony heretofore. Do you know the extent of the Iron Mountain Terminal at Fort Smith?

A. Do you mean the mileage of tracks in the yards?

Q. Yes?

A. No, sir.

Q. Or the amount of property owned there for terminal purposes?

A. No, sir.

Q. Have you in your office a map or blue-print, of it filed where we can get it conveniently?

A. There ought to be a blueprint, not in the Auditor's Office, but in the engineering department of the Ft. Smith terminals.

Q. I would like a statement of the amount of property owned there

for terminal purposes, at the same time. You will furnish us with this will you?

A. Yes, sir.

Q. Now, Mr. Johnson how do you charge the expense of the Ft. Smith terminal? To what accounts does that go?

A. What expense accounts?

Q. Yes, I mean geographically, where is it charged?

A. The State of Arkansas. Now the train service that passes through Ft. Smith and Van Buren is divided on a mileage
2184 basis, but the station and yard service is charged to the State of Arkansas at Ft. Smith.

Q. That is what I am referring to—the exhibit in your testimony—it is charged to the State of Arkansas?

A. Yes, sir.

Q. Have you in your office any separation of the terminals expenses of Ft. Smith from other expenses?

A. No, sir.

Q. Is there any way that that could be ascertained from the books kept in your office?

A. I don't believe that the entire expense of the Ft. Smith terminals could be determined now over that period. There are certain items that could be, but others that come from labor and repairs—the same conditions prevails at Kansas City during the Missouri rate cases. We were unable to get that information during the entire period. These operating expenses are maintained by accounting districts.

Q. What accounting districts would cover these Ft. Smith terminals?

A. All mileage from the Okla. State line to Argenta, or Ft. Smith crossing, that is the central accounting district, the central division.

Q. These operating expenses would be swell*oad*ed up in the expense of about 165 miles?

A. Yes, sir, a hundred and sixty five miles.

2185 HENRY WILLMERING, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. Please state your name, age, residence and occupation?

A. Henry Willmering, aged 40 next birthday, occupation, employed by the Corporation Commission of the State of Oklahoma, designated as auditor in charge of its division of accounts and statistics.

Q. How long have you occupied the position of Auditor of the Oklahoma Commission?

A. My association with the Oklahoma Commission began with the beginning of statehood in Oklahoma, in November, 1907, and I have been continuously employed since that time.

Q. What are your duties in your present official position?

A. My duties are to check, in the first instance, my duties are to

prepare inquiries relating to statistics and accounts, of all public service companies operating in the State of Oklahoma, express companies, railroad companies, street railway companies, electric light companies, telephone, telegraph companies, and electric light plants, and to describe the accounting system under the direction of the commission, for such companies; to prepare forms for annual returns to the commission, to analyze such reports, check them for omissions and variations and discrepancies, to prescribe forms for monthly reports of revenues and expenses for such public
2186 service companies, and to investigate the various accounting systems throughout the United States, in use by such class of companies, and in a general way, to have entire supervision of all and any matters relating in any way to accounts and statistics.

Q. Prior to your engagement by the corporation commission, what business were you engaged in?

A. In railroad service.

Q. I wish you would state somewhat in detail, what experience you have had in railroad service?

A. I have occupied various positions in the operating department, as agent for railroad companies, beginning in the year 1892, with the Pennsylvania Company in the City of Chicago, and ending in the year 1907, with the Missouri, Kansas & Texas Ry. Co., in the State of Oklahoma.

Q. Just state the various positions you held with the different railroads; I want to show the line of work in which you were engaged before you went with the Corporation Commission of Oklahoma.

A. Beginning in the year 1892 for the Pennsylvania Co., as yard clerk in their 55th St. Yard, subsequently in the abstracting of their local office at Madison St., local car accountant's office and in billing freight; with the Wabash since that time as bookkeeper in the cashier's office, local station and station accountant; also, with the claim and tracing department as cashier, and as agent for the Wabash and subsequently with the Missouri, Kansas & Texas
2187 Ry. as agent at Cleveland, Ohio; subsequently as agent at Cleveland, Okla.

Q. Have you made a study of railroad accounting and distribution of railroad costs?

A. I have given much time and thought and attention to matters of that kind since becoming associated with the Corporation Commission of Oklahoma.

Q. Are you familiar with the accounting system put in force by the Interstate Commerce Commission?

A. Yes, sir, I am entirely familiar with it.

Q. Have you been engaged in investigating accounts of distribution of costs, distribution of the property, of revenue, between state and interstate traffic?

A. I have given much time and thought to these problems; I have heard the testimony of eminent railway accounting officials; I have read the testimony of eminent railway accounting officials; I have attended the convention of American Association of Railroad ac-

countants at Cincinnati; I have read the sense of the meetings of the National Association of Railroad Commissioners, and have read after Prof. Adams of the Interstate Commerce Commission, and as a matter of fact, I have endeavored to get everything relating in any way to matters of that kind that was printed.

Q. Have you kept in touch with the rate litigation involving these questions, in Missouri, Arkansas and Oklahoma?

A. I have read a great deal of the testimony that was offered in these cases, yes, sir.

2188 Q. Are you familiar with what is known as the revenue theory of dividing proper and dividing expenses between state and interstate traffic?

A. Yes, sir.

Q. Have you given study and investigation to that theory or basis, whatever you may call it?

A. I have.

Q. I wish you would express your opinion, as to whether the division of property between state and interstate business, based upon the gross revenue received from state and interstate business, is a fair division of the property devoted to these respective uses?

A. I do not think it is.

Q. I wish you would give your reasons for your opinion?

A. My reasons are that on a revenue basis, property assignable to any character of business, should be based entirely upon the rate of charge; if the rate of charge is increased or decreased, the value of property would correspondingly increase and decrease, and on the same volume of business of ton miles or passenger miles, or in volume, would be up and down, according with the rate of charge, as it increased or decreased, and in my judgment, it is too elastic; there should be some fixed basis that would in some way assign the property to any particular class of business that would be more rigid.

Q. The exhibits in this case show that the revenue per ton per mile on the Iron Mountain Railroad, in the period of our inquiry, on interstate freight traffic, is 6.750 mills, and the revenue

2189 on the intrastate traffic, per ton per mile is 13,377 mills; that is found in Exhibit #5 of the Iron Mountain Railroad. In the testimony of Mr. Kimbell, taken on behalf of the defendants in this case, it is shown that the average revenue per ton per mile on state business is 20 mills, and on the interstate is 8½ mills; that was for the period of six months, ending December 31, 1907, on the St. Louis, Southwestern Ry. In view of these facts, I wish you would state your opinion of the effect of using the revenue as a basis of dividing the property.

A. The effect would be, that owing to the revenue or rate of charge per ton per mile, all other things being equal, that it would throw an extraordinary burden upon the intrastate traffic, and would require the intrastate traffic to earn a great return upon the valuation of the property than would be required of the interstate traffic, and would result in unreal profits on interstate business, and would throw a very heavy burden upon intrastate business.

Q. I am confining this inquiry to the division of property upon the revenue basis.

A. Yes, sir, but at the same time, it would assign to the intrastate business, a greater proportion of the property than would be justifiable or than would be fair, in my judgment.

Q. On account of a larger revenue per ton per mile being earned upon that than upon the other?

A. Yes, sir.

2190 Q. It was shown in this case that after this period of which I have given you the figures, that the intrastate rates were increased 96%, and the interstate 9%; I am using the round figures, and leaving out the decimals; during the month of January, 1909, the St. Louis, Southwestern Railroad conducted its business with those respective increases, 9% on the interstate and 96% on the state, as compared with the period for which I have given you the figures heretofore; I will ask you what effect or influence that would have upon the division of property upon the revenue basis?

A. It would correspondingly increase the value of the property assignable to intrastate business, and would increase the burden for intrastate business; there would be no corresponding increase in the property assignable to interstate business, and the result would continue as it was in the first instance, that the burden was thrown on the intrastate business, and unreal profits and a heavy return on the property valuation would result from the interstate business.

Q. Would there be any real difference in value of the property used for state business and that used for interstate business, by reason of change of rates?

A. In reality there should be none, but it would result in increasing the value of property for intrastate business, when in reality there should be no such increase.

Q. And result in a relatively smaller increase in the interstate when in fact there was not?

A. Such assignment would result in a decrease of the valuation of interstate property.

2191 Q. When in fact, there is no such fluctuations in the property itself?

A. When in fact there should be none.

Q. In your thought, study and investigations on this subject, have you reached a conclusion as to what would be a proper basis of dividing a conclusion as to what would be a proper basis of dividing the property between state and interstate?

A. I have.

Q. What is that?

A. In my judgment, the division of property between state and interstate business, should be on the ratio that the intrastate expense is to the total expense within the state.

Q. Dividing it then upon the basis of expense, instead of a basis of revenue?

A. The cost of earning the revenue.

Q. Why is that?

A. After the expense is ascertained upon a fair basis, it is obvious that the expense would remain the same whether the rate was increased or decreased, and it is obvious that if there is a more rigid way of ascertaining the value of property, and it is not subject to ups and downs of rates, and to a decrease or increase of revenues, in order to ascertain the value of the property, it approaches the actual conditions to a greater extent than any other basis I know of; when the value is ascertained on that basis, in my judgment, it is nearer real than upon any other basis I have heard testified to or
2192 argued.

Q. I believe you have testified that you have given thought and attention to the division of expenses, as well as the division of property upon some proper basis?

A. I have.

Q. I will ask you what is your opinion of the method or theory of dividing the expense between state and interstate traffic, and upon revenue derived from each traffic respectively.

A. I worked out a form in numerous ways, and applied to railroads operating in Oklahoma, and I have found that it always results, owing to the higher rate of charge for intrastate business, it always results in showing, what, in my judgment, is unreal profits for interstate business, and that the extra cost theory, in addition to the revenue basis, it shows there could not ever be any rate by any state regulative or government regulative body, that might not be declared confiscatory by the courts; I believe the foundation was invented for railroad purposes only, and I believe some clever railroad lawyer is responsible for the invention.

Q. Is it used in practical railroad work at all?

A. In the real railroading I have done, I have never known it *to* be used.

Q. You spoke of the extra cost, are you referring to the extra cost which various witnesses in these rate cases have burdened the intrastate traffic with?

A. Yes, referring to the testimony of men like Mr. Carl Gray of the Frisco, and Mr. Dodridge and Mr. McPherson, and in
2193 the various cases heard before the Corporation Commission of Oklahoma.

Q. Are you familiar with the rates, state and interstate, prevailing in this section of the country, and have you made a study of them?

A. In a general way I am familiar with them, yes, sir.

Q. Are those rates so made that they reflect the cost of service, and that the rates can be taken as a measure of the cost or expense of handling the traffic?

A. In a general way, the rates are not made on the cost of service. I believe that railroad rates are made on tradition, not on condition, and from my investigation, I find that railroad rates, when they are made without restriction, are primarily made by the traveling freight agent or a contracting agent, and by up-to-date freight agents; they feel the pulse of the business around the territory occupied by their company, and in the past, it has been the

custom that if the business was offered and could not move at the standard rate, a lower rate was made, irrespective of the cost of service, to get the business. I have been present at the cross-examination and assisted in the cross-examination of many of the eminent railway traffic officials who are at the head of the traffic departments of those roads operating through the state of Oklahoma, and I have never heard one state positively that he had any regard for the cost of service in making rates.

Q. Could a railroad company operating in the section of the country, have any cost accounting system by which they
2194 could ascertain the cost of handling any given traffic?

A. I have never discovered it if they have, and I don't believe they have; if they have, it is a dark secret, locked up in the breast of some accounting official that I have never discovered.

Q. It hasn't come to the light of day in these investigations?

A. No, sir.

Q. What statistics have they, if any, upon the cost of doing their business?

A. The Pennsylvania Co. and Wabash Company ascertain their average cost per ton per mile and per passenger per mile, they have done that on the Pennsylvania road since the year 1867.

Q. That is, the aggregate cost per ton per mile of all the traffic?

A. Yes, sir, of all the traffic; in other words, feathers, coal, silks and sand, carload and less than carload, and gives the general average of cost.

Q. All of the railroads keep such systems as that?

A. Generally that has been the practice in the real art of railroading, yes, sir.

Q. But that general statement does not show the cost upon any particular commodity or class, does it?

A. No, that would be necessary to analyze the commodities that have to be segregated, separated and the ton miles determined for each commodity and average haul, and all such matters taken into consideration, in order to measure up the real cost.

2195 Q. That has not been done?

A. Not to my knowledge.

Q. Do you know whether the rates prevailing in this section of the country are made upon zone or blanket rates, and whether there is any considerable extent of them so made?

A. Yes, sir, that is one of my reasons for stating that rates are made irrespective of costs.

Q. I wish you would explain that; explain how those rates are made, and what effect it would have upon the cost?

A. In the beginning of our investigation upon rates in the State of Oklahoma, we found there was a lumber producing zone in Louisiana and Texas, and I found—I prepared a map for General West, which he used in the conference at Kansas City, and succeeded in having certain interstate rates reduced at that conference; the lumber zone in Texas and Louisiana, they apply from that zone to Omaha a rate of 23 cents, and the same rate is applied to inter-

mediate points in Oklahoma, and in Kansas and in Missouri, and in Nebraska, irrespective of the haul or the distance.

Q. Roughly speaking, how much territory would be included in that zone, where the rate is the same?

A. I don't recall the distance now, but I presume the maximum distance of the haul would be from Bowman, Texas territory to Omaha, via the Santa Fe, and its connections at Kansas City or Topeka, at Kansas City I guess; that would be the maximum in my judgment, about a thousand or twelve hundred

2196 miles.

Q. What would be the minimum haul of the same weight?

A. I believe we found the minimum haul was a distance of about 250 or 275 miles.

Q. Then roughly speaking, there is a haul of about four times the distance for the same rate, is that correct?

A. Yes, that again shows that rates are made irrespective of cost of service.

Q. Isn't there another factor entering into that, that is the division of the rate between different railroads?

A. Yes, sir, in some instances tap lines give constructive mileage or flat rate per car rate, which absorbs a great part of the revenue before the rate is pro-rated with the connecting lines, and results in a very low rate per ton per mile for the roads participating in the haul.

Q. Then there would be wide differences in the revenue received from rates made under such a plan?

A. Yes, there would be wide differences; the rate might range all the way from possibly three or four mills per ton per mile to 12 or 15 mills per ton per mile; in my investigation, I have seen cases of that kind.

Q. Is there a large traffic moving under this lumber rate that you are referring to, from that zone.

A. Yes, sir, a large volume of business.

Q. Are there any other commodities where there is a large traffic, that have their rates made in the same way, to your knowledge?

A. Yes, the grain rates from Kansas City to Gulf points;

2197 we discovered that the rate from Oklahoma points to the Gulf was the same rate that prevailed from Kansas City to the Gulf, plus the local rate from Oklahoma points to Kansas City, and that discloses the entire scheme of rates that obviously was made without respect to the cost of service.

Q. Explain what the difference would be there in the rate per ton per mile, speaking roughly of the different commodities moving different distances under that?

A. The rate would afford, in my judgment, all the way from say 5 mills per ton per mile to 20.

Q. Is there a large volume of traffic moving under such rates as that?

O. Yes, a great deal of Oklahoma grain moves under such rates, and grain from Western Kansas.

Q. What other instance do you call to mind, of rates made in that way, where there is a large volume of traffic moving.

A. The rates on crude oil and petroleum and its products, from Kansas refineries to the gulf.

Q. We are not producing oil in this state, and I will not pursue that; I will ask you about coal?

A. That condition prevailed on coal, and recently I have investigated and I have discovered, from reading a number of tariffs, that there are more than ten thousand rates in existence today, that are lower per ton per mile, for mines in Indiana and Illinois to points in Dakota, Minnesota, Iowa, Nebraska, Kansas, Missouri, Oklahoma, Arkansas, Texas, and a great many other states,
2198 that are lower per ton per mile than any rates ever made by our commission or by your commission, and they are made in the same manner; their groups of rates are made in about the same manner as Texas lumber rates, from group to group or zone to zone.

Q. Are you familiar with the coal movement from the Rocky Mountain region?

A. No, sir, only in a general way.

Q. Are the rates made in the same way, do you know?

A. I cannot recall from memory now, I am not prepared to say.

Q. How is cotton moved?

A. Cotton is usually moved into the compress upon first class rates; I have not made a very fair investigation in respect to cotton.

Q. Do you know whether cotton goes to the distributing points in the east for export, upon the same rate from one point in the east to another point; have you examined that?

A. I have not examined that thoroughly; I know that is the case in a general way, but I have not investigated it.

Q. Isn't there a difference in the absorption of compress charges and handling of cotton, where the handling expense would be the same, in one instance the compress charge is absorbed and in the other, it is not?

A. Judge, I haven't investigated that thoroughly, and I am not prepared to testify in regard to that.

Q. Are you familiar with the Texas common point rates; I mean, with the system; I do not mean with the individual
2199 rate?

A. In a general way, yes.

Q. What is that system?

A. Texas common point rates are built from the gulf to points in Texas; the general minimum haul reaches 200 miles, with a maximum rate at that point and the maximum haul is something like 7 or 800 miles, with the same rate applicable to the short haul and maximum.

Q. I believe it is in evidence in this case already, Mr. Perkins Exhibit 42, that there is about 2600 of those stations in Texas where the common point rates prevail?

A. From what points?

Q. Say from St. Louis and north and east.

A. Yes, those are all in the Leland tariffs and in the directory published by Mr. Leland; I know about those rates in a general way; I thought you were referring to the rates made by the Texas Commission.

Q. No, I mean the rates to Texas from the north and east, through the trade centers?

A. Yes, sir, there is a blanket territory or zone territory and also from Oklahoma, on which rates are made from Cleveland, and Dayton, and Detroit, Chicago territory, and St. Louis and Missouri river territory, and I believe most all those rates are made without any true regard to the cost of service.

Q. They are substantially the same rate, with variations in distances, with various divisions of the rate between the different railroads?

2200 A. Yes, sir.

Q. Now, not to pursue the illustrations into too much detail, I will ask you generally, what effect these various illustrations that you have given, have upon the revenue of a railroad, and what effect it would have upon dividing the expenses of the traffic between state and interstate business?

A. It would have the effect of assigning to a state like Oklahoma, or Kansas, Missouri or Arkansas, a very short rate per ton per mile for interstate business through these states, and would result in assigning to these states an interstate revenue per ton per mile, which in some instances, I believe would be less than the cost of service, and the aggregate interstate revenue assignable to these states, or to any of these states, would be in the first place, assumed to be upon an equality with intrastate revenues; that is, that it would not cost any more to earn a dollar of interstate revenue than a dollar of intrastate revenue, and the rate of charge being so much higher upon intrastate revenues than it is upon the pro-rata of interstate revenues, which would result in showing, for interstate business a too small profit, and would throw the burden upon intrastate business of unreal expenses.

Q. And that burden would not be real burden incurred by that traffic but an unreal one placed upon it by this method?

A. It would be an arbitrary burden, not real at all. The

2201 revenue basis assumes that it would not cost any more to earn a dollar of intrastate revenue than it would to earn a dollar of interstate revenue.

Q. If in addition to dividing your expenses that way, you go to adding to your interstate revenue 100% or from 100 to 125%, what effect would that have upon getting at the truth of that division?

A. It only results in the application of opinions of men, in order to ascertain the expenses, when the real and actual facts would be absolutely different from the opinions of certain men; preconceived notions of eminent men I have heard testify, have been destroyed by an application of real facts and figures.

Q. Suppose that you were directed to ascertain as near as possible, the actual cost of state and interstate traffic, not upon any theory, but

according to actual conditions as near as possible, to find the actual conditions and as near as possible to get the actual expense located to different classes of traffic, and where that could not be done, to get an approximation as near as possible, how would you go at that kind of work?

A. First, in the operating expenses, I would ascertain the actual expense for maintenance of way and equipment, within the state.

Q. Suppose that was a given factor, that you had the actual maintenance of way and structures expense, then what would you do with the division of that between these traffics?

2202 A. In making the division between the passenger and freight traffic, I would ascertain the actual revenue train miles, passenger, freight, and mixed train.

Q. Let me have you give an explanation there of what you mean by revenue train miles?

A. Train miles producing revenue for the road.

Q. Excluding work trains?

A. Yes, sir, and classified in accordance with the classification prescribed by the Interstate Commerce Commission.

Q. Go ahead?

A. Mixed trains carry both passengers and freight; I am not familiar with the operation of the mixed trains in Arkansas, but in Oklahoma, we have a number of mixed trains which are practically accommodation trains, which carry more than one coach, passenger coaches; for that reason, it would be fair, in my judgment, to assign 50% of the mixed train mileage for the ascertainment of the passenger expenses.

Q. That, of course, would be dependable upon local conditions?

A. Yes, sir.

Q. And suppose, as it is in Arkansas on the Iron Mountain particularly, that there are a very few of those trains?

A. Whatever the conditions are, I would be governed by such conditions.

Q. You would apply that according to the respective conditions?

A. Yes, sir.

Q. Do you know what the Interstate Commerce Commis-

2203 sion basis is, for that division?

A. I think that Prof. Adams or some of his associates, have indicated that 25% of the mixed train miles should be assigned to passenger expenses, and I would apportion the expenses upon this basis; I would ascertain the sum of the passenger train miles plus this percentage of mixed train miles, and get the ratio that is to the total revenue train miles, in the state and apportion that expense of the total operating expense, to the passenger business for maintenance of way and structures; the remainder would be assignable to freight traffic.

Q. Now, take up your freight traffic, how would you assign the remainder of that?

A. If, in view and in light of the testimony that has been offered in these various cases, in order to satisfy myself with respect to the operation of the so-called expensive local way freight trains, and the

through freight trains,—in my judgment the separation could be equitably made by finding the number of freight car miles performed by the local way freight trains, and such as were classified in the official schedule as local way freight trains——

Q. You would refer to the local trains as classified?

A. Yes, sir, in the official employee's time tables.

Q. But the real index to that, I presume, would be the actual work of each train, wouldn't it?

A. Yes, sir, that would be the real index, and that could be secured from the wheelage reports of the conductors and dispatchers and officers of the company, on established forms that the rail-
2204 roads would have.

Q. That is an ascertainable fact?

A. Yes, sir; after I ascertained from my wheelage reports or from time tables, or whatever I considered or found or determined to be the best index, I would find the number of car miles made by local freight way trains for a given period, and the ratio of that to the total car miles in the state, I would ascertain the per cent of that ratio, and that per cent of the total maintenance of way expense, I would assign to local way freight trains.

Q. That is for the freight?

A. Yes, sir.

Q. You have already excluded the passenger?

A. Yes, sir.

Q. Isn't there another unit that is used by railroads other than car miles?

A. Yes, the ratio of the local way freight train miles to the total train mile.

Q. That is the train mile, instead of car mile?

A. Yes, sir.

Q. Both of those units are in common use in the divisions of expenses by railroads are they?

A. They are in common use in the division of expenses between freight and passenger.

Q. Is the car mile used to divide between the freight and passenger, or is the train mile used?

A. The train mile is commonly used.

Q. Speaking of the freight traffic, I believe you say you would make it upon the car mile; I would like for you to give
2205 your reasons why you think that would be better?

A. I would give it upon the car mile, for, from observation I find that oftentimes a local freight train would pull more cars, have more cars in the train, than the following through freight train, and I find it vice versa, and in order to get a fair average, I believe that car mile should be taken in place of the train mile.

Q. You think it is nearer the actual results than the train mile?

A. Yes, sir, in my judgment.

Q. The train mile, however, is the unit which is used for this purpose?

A. Yes, sir, Mr. Nay endorses the train mile for the unit of expense in his testimony before our commission.

Q. Mr. Nay is comptroler of the Rock Island?
A. Yes, sir.

Mr. MOORE: We object to that.

A. He is a very eminent accounting official and I would be governed by his testimony a good deal.

Q. Now, with that explanation of your units, I wish you would proceed with your plan; that would cover that account, wouldn't it?
A. Yes, sir.

Q. Now, take the maintenance of equipment, how would you handle that?

A. I would ascertain the actual expenditures made upon each locomotive, I would identify the locomotive and from the conductor's and engineer's reports, I would determine the mileage made
2206 by each individual locomotive in the state if possible.

Q. Can that be done?

A. It can be done on the M. K. & T.; I am not sure that it could be done by systems and methods employed by other railroads.

Q. I want to state to you the state of evidence in this case, in regard to the Iron Mountain; Mr. Johnson, I think, has testified that they have a pooling arrangement with the entire Missouri Pacific system; that they have various shops, one across the river from Little Rock, and at various other points, and the repairs are pooled between the states; are you familiar with that method of handling that account?

A. I have heard there was such an arrangement; I am not entirely familiar with the method, but if such a method was in existence or in practice, then an apportionment of the locomotive repairs could be made upon the ratio of the locomotive miles in the state to the total miles upon another system.

Q. And then again between the trains?
A. Between the local and through trains.

Q. There has been some testimony in this case, that there was an extra expense on the local trains, by reason of the additional stops and starts and switching done by it, more than was made by the though train; are you familiar with that contention and the facts upon which they base it?

A. I am familiar with the contention, but from observation
2207 and experience in railroad business, I found that a great deal of that is imaginary; of course, more frequent stops made by any train, would have something to do with the expense of repairs.

Q. Suppose that that was real, and you have the opinion of some of these eminent operating officials as to the extra amount of that, could you, as an accounting proposition, take care of that extra expense in the location of these expenses between local and through trains?

A. Yes, that is possible; you would want to use the opinion of these eminent operating men, and that could be worked out and ascertained.

Q. How would you work it out, say 50% was allowed for that or 25% or any other given per cent.

A. As between local and through trains?

Q. Yes?

A. For instance, the local train miles were 100, and the through train miles was 200, and the total 300, you could add 50% to the local train miles, making it 150, and the through locomotive miles would remain the same making it 350 the total; the ratio, with 50% extra would be the ratio of 150 to 350, in place of 100 to 300.

Q. And in that way, you would take care of these extra expenses that these eminent gentlemen think attaches to that kind of train?

A. That would take care of it in my judgment.

Q. Now, we have been discussing locomotives principally; would the same principal apply to maintenance and equipment of

2208 freight cars?

A. Yes, sir, between local and through trains, the ratio of the car miles.

Q. Now, the next one of these primary questions, is the traffic expense, I believe, what is your idea—do you understand what that traffic expense is?

A. Yes, sir, it is the expense of maintaining foreign agencies and advertising for business, and for the solicitation of business at points on connecting lines, and a great many of such offices are maintained in San Francisco, New York, and important business centers throughout the United States, representing certain railroads at such points, and advertising superior service and soliciting business from competing lines.

Q. What proportion of that, if any, should be charged to intrastate traffic?

A. I should ascertain the part of the expense assignable to intrastate traffic, I would investigate and define what office expenses of each were chargeable to that class of expenses that were located within the confines of the state, and would exclude any expenses relating in any way to any business outside of the state.

Q. Do you think that that business, that those offices outside of the state, contribute to the intrastate traffic?

A. A man would have to work on his imagination if he found such to be the case.

Q. As a practical problem, you think it affects the interstate traffic, not the intrastate?

A. I don't see how it could affect the intrastate in any

2209 way, only for those located in the state.

Q. City ticket offices and things of that kind.

A. Yes, sir.

Q. In the division between state and interstate, some of these gentlemen have testified that that should be divided on a revenue basis, what do you think about that? Do you think that would be fair?

A. No, sir, I think it should be divided upon the basis that the locating expense is to the total locating expense.

Q. That is a general accounting proposition that is considered sound?

A. I have heard it commended very highly by cost accounting officials; I have read their treatises and text books,

Q. Now, when you come to transportation expenses, the station expenses, how would you divide that between state and interstate, or can it be divided between state and interstate, upon a fair basis?

A. It could be divided upon the basis of tons handled, intrastate and interstate; I would determine the average haul for interstate business, and the average haul for intrastate business; I would charge two terminals to intrastate business; I would double the tonnage for that purpose, after ascertaining the expenses properly assignable to intrastate business. For example, if the tons intrastate was 100, and the tons interstate were 200, total 300, I would double the 100 tons of state and make it double the tons of state handled, and make it 200, and then I would ascertain the average haul for interstate business; and if it was more than 100 and
2210 less than 200, miles, I would then charge the interstate with 2 terminal expenses.

Q. Why would you do that?

A. Because, from observation and experience, I find that the interstate cars are handled at terminals the same as intrastate.

Q. You mean division terminals?

A. Yes, sir.

Q. What is the usual distance of those division terminals apart?

A. They average about 100 miles.

Q. You would take that as a determining factor, as to the number of terminal handlings?

A. Yes, sir, division terminal handlings, and if the average haul was over 200 miles, and less than 300 miles, I would multiply the actual tonnage by three, and in case of that kind, you would have 3 times 200, or six hundred, and two times one hundred or two hundred, the ratio is as 200 is to the total 800.

Q. Suppose that the intrastate business moved more than 100 miles; how would you handle that?

A. You have originating terminals or local stations, and destination—that would be two terminal handlings.

Q. You have to add one more?

A. Yes, sir, for the division terminal.

Q. If it ran over 100 miles?

A. Yes, sir.

Q. That would be your judgment of the proper way to divide that expense?

2211 A. Yes, sir, that is my judgment and observation of the expense at division terminals.

Q. In these cases, these eminent gentlemen to whom we have referred, have testified that there were two handlings on state business and only one on interstate, and in some instances, none at all on interstate; that is what they call trans-state; in view of their views upon this subject, suppose you would allow two handlings, and double your tonnage at stations of intrastate business, would that be giving the railroads all they were entitled to, on that division?

A. Yes, it would be very liberal with the railroads, give them all they were entitled to.

Q. And more too?

A. Yes, in my judgment.

Q. Certainly, it would be fair from their standpoint to do that?

A. Yes, that is about the maximum they have claimed from the testimony I have heard.

Q. Would that extra cost you have heard them put upon that, be fully taken care of if a division of that kind was made?

A. In my judgment it would.

Q. The maximum of it?

A. It would produce the maximum, yes.

Q. This is the station we are discussing, and not yards and terminals?

A. That is the expense of station and station agents, and employees, help in the yard chargeable to that account.

2212 Q. Are the yards included in that; isn't that under another sub-division fixed by the Interstate Commerce Commission?

A. The yard clerks?

Q. The man at stations or at terminals?

A. At stations for instance, they would have a yard clerk on the station force that would check the cotton on the cotton platform, and the loading of cotton.

Q. Under the interstate commerce classification of that, wouldn't that go in as yard service, that clerk you have referred to?

A. Yes, I am quite sure it would; the yard employees,—yard clerks.

Q. Take up that next, yard expense, how would you handle that between the local and through trains?

A. I would ascertain from the records the number of cars handled for each class of trains, by the yard switching crews.

Q. I believe you and Mr. Dodridge would agree on that proposition, if I remember his testimony correctly; that is an ascertainable fact, isn't it?

A. Yes, sir, it can be ascertained; I am not sure it can be ascertained on all roads, but on roads I am familiar with, it could be ascertained.

Q. Could the fuel be ascertained and how could it be located.

A. We have the aggregate fuel expense, and we could get the aggregate mileage performed by the locomotives; we could get the average cost per locomotive and that could be multiplied by the number of locomotive miles in the state, or the ratio could be ascertained.

2213 Q. That is an actual ascertainable fact?

A. From the present accounting system, yes, sir.

Q. Now the train men, wages and things of that kind, can be ascertained actually?

A. From the pay rolls, yes, sir.

Q. Loss and damage to freight, could that be ascertained accurately?

A. Yes, sir, from an examination of the voucher.

Q. That could be ascertained actually between state and interstate?

A. It could be ascertained from the billing.

Q. The accounting expenses, do you know any approved method

that accounting expenses could be ascertained and apportioned to through and local traffic?

A. It could be taken care of on the same basis that traffic expenses are taken care of, on the ratio of located expenses to the total located expenses.

Q. In other words, the overhead on the basis of direct expenses?

A. Yes, sir.

Q. Loss and damage to freight can be ascertained directly between state and interstate from the waybills?

A. Yes, sir, and from the vouchers.

Q. Now, taking your train expenses here, between local and through trains, having ascertained them in the way that you have explained, how would you work that out between state and interstate?

A. I would ascertain the character of the freight carried by each class of trains, and I would carry that in ton
2214 miles.

Q. By character, do you mean whether it is state or interstate?

A. Yes, sir.

Q. That is an ascertainable quantity?

A. Yes, sir, it can be ascertained from the billing from the waybill; I would get the ton miles performed for state and the interstate part, by each class of trains, get the ratio and the expense could be divided upon that ratio—the percentage.

Q. When you work out your expense that way, it would be nearer a true basis, nearer the actual facts than if you worked out your expense by a revenue basis?

A. Yes, sir, it would be more accurate, and it would follow in line with the testimony of the railroad experts, testifying before our commission.

Q. It would enable you to take care of these extra expenses, according to their opinion of what they are?

A. It would be facts and figures, applied to their theory, in a great measure; not altogether, however.

Q. It would have a great many of these matters you have testified to, would be actually and the others approximation?

A. Yes, that is true; the degree of accuracy would be greater than the degree of inaccuracy, and would have the revenue basis skinned a city block, because there is nothing to the revenue basis, in my judgment.

Q. We have gotten through with the freight, I don't care about taking the matter in too much detail; I will ask you generally if the passenger business could be worked up the same way,
2215 allowing for differences in character of business?

A. Yes, sir, along the same line, allowing for differences in character of service and character of business.

Q. How would you take care of mail and express on the passenger proposition?

A. In the apportionment of passenger expenses, I would find the space occupied by that class of business, mail, express and baggage;

that is, on the ratio of the passenger expenses, and to be assigned on the ratio of the passenger to the Pullman car, dining car or the sum of those, if any, of such class of equipment, the sum of those to the total passenger train car miles.

Q. Take the train as the unit and dividing it up into express and mail and passenger?

A. For example, if a train was made up of five coaches, two of which were for mail, express and baggage, the ratio would be as two is to five, or 40% of the cost of operation of the passenger train, which would be assignable to miscellaneous passenger revenues, and the remainder would be assignable to the cost of carrying passengers, and the earnings of strictly passenger revenue?

Q. Do you mean to passenger revenue or to mail and express revenue?

A. As I stated, in a passenger train consisting of five cars, two of which were devoted exclusively to mail and express, and other miscellaneous passenger revenues, and the third was devoted to the earning exclusively of passenger revenue, account No. 2, I would assign to the miscellaneous passenger revenue, the cost of
2216 earning it, 40% of the total passenger expenses.

Q. Now, in miscellaneous earnings, there are other items than that made by train?

A. Yes, sir, there are a few others infinitesimal.

Q. Just to take, without going into too many details about that, your idea is about this, take a train made up of five cars, you would have a locomotive, mail and express car and baggage car, and your passenger equipment was three cars, then you would divide that into five parts, and carry them to their proper head, along the line you have done in the freight business, is that the idea?

A. Yes.

Q. Now, you stated awhile ago, that the best division that you knew of, of the property, was on the cost basis; do you mean that it is the best possible one to be worked out, or do you mean the best that has been presented to you?

A. Under the conditions that have been presented to me, yes, sir.

Q. Don't you think that by a direct accounting system, if the railroads kept or were required to keep an accounting system, and get at these matters actually, don't you think we could get nearer at the truth?

A. Yes, sir, it is possible; we are making rapid strides in accounting, in all branches of accounting, and particularly in railroad accounting, there having been rapid strides made and uniformity is the effect.

Cross-examination.

By Mr. MOORE:

2217 Q. In your explanation and in your formulas that you have described for dividing the expense of operation, you have omitted a number of items; naturally you would do that, your attention not being called to them; I want to ask you if you will pre-

pare a formula showing the manner in which you would divide all the expenses of operation, as between passenger and freight and then between the various items of expense that are incurred in freight operation, and between state and interstate, and I would suggest to you to follow the form of statement No. 5, Exhibit #3, filed by plaintiff in this case, and I will furnish you a copy of that form. Have you seen any of the exhibits filed by the plaintiff in this case?

A. In the beginning, I saw copies of the Rock Island and Frisco Exhibits, and I believe I saw copies of the Cotton Belt exhibits.

Q. That is, the exhibits that were used in the application for injunction?

A. Yes, sir.

Q. I mean the exhibits that have been filed since we began, to take testimony before the master in this case?

A. No, sir, I don't believe I have seen any of them.

Q. Now, I will ask you to prepare an exhibit covering the division between freight and passenger, and then the division of operating expenses, as between state and interstate, and follow the formula to which I called your attention a moment ago, namely, statement No. 5 to Exhibit #3, filed by plaintiff in this case, and I will

2218 furnish you a copy of that statement; I ask you to file that as Exhibit "C" to your testimony in this case, and I will ask you to file that as soon as possible after you prepare it; I wish to have it before I cross-examine you.

A. All right sir, I will do that.

For Exhibit C, see Vol. 9, page 5771.

Cross-examination continued.

2219 J. G. WALLACE, being duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. Please state your name, residence and present position?

A. I live at Russellville, Polk County, Arkansas, and am chancellor of that district, 9th Chancery District in this state.

Q. What connection did you have with the Arkansas Railroad Commission?

A. When the Legislature provided in 1900 for the creation of a commission to regulate the railroads, I was appointed on the commission by Governor Jones, on the 11th of March, 1900.

Q. That was the first Commission?

A. Yes, sir.

Q. You served as chairman part of the time, did you not?

A. Yes, sir, the second term; I served two terms; at the expiration of the first term I was re-elected; I was elected by the commission, chairman of the commission.

Q. How long did you serve on the commission?

A. Approximately about four years, not quite. I was appointed

in 1900, March 11th—it was 1899, March 11th, and served until about January 10th, 1903.

Q. You went off the commission at the same time Mr. Hampton came on, didn't you?

A. Yes, sir.

Q. Prior to the organization of the commission had there
2220 been any regulation of the railroad freight rates by the state?

A. None, no sir, not by a commission.

Q. Had there been any state control over freight rates?

A. No, practically none; they were free to make their own rates.

Q. What system of rates was in effect over the state, at the time you went on the commission, just describe the situation as it appeared to you at that time?

A. Of course, they had a distance tariff which provided in all cases where there was no other tariff that was applicable; that is, where they filed tariffs and fixed no through rate sheet applicable, the distance sheet is the tariff; that is, where the freight is moved strictly on a mileage basis, and you are supposed to pay for your mileage, but really that wasn't the prevailing tariff sheet; the distance tariff is supposed to be, and in fact is, the basis upon which the traffic is moved, that is, the mileage basis; now, they had superseded practically the distance tariff by their locals and specials; for instance, they had local rates prevailing between trade centers and outlying posts; that was the rate applicable between that trade center and a particular outlying post, and not applicable at all to intermediate posts, and there was a very substantial and vital discrimination sometimes as between these points, worked out through these locals. Then they had what was called jobbers' rates, that was a rate—their locals was a to and fro rate between trade centers and that particular
point, but jobbers' rates were rates that applied from the trade
2221 center out to the outlying post, but not back again.

Q. Not from the outlying point to the trade center?

A. No, sir, that was the distance between the locals and the jobbing rates, as their jobbing rates were even lower than their locals; then they had milling point rates that the commission never interfered with particularly; that was a rate on raw material into mills; the rule was that the road was at liberty to transport raw material into mills, and when it was manufactured, they were entitled to the out rate then.

Q. From the point of origin?

A. Yes, sir, and it took the Commission's rate, but into the mill we didn't try to regulate it; that was largely an interstate proposition, although many shipments were made to intrastate points from mills.

Q. Did you find any other objection to these tariffs than their discriminations?

A. Yes; we found this state of things; we found that they were discriminating against our trade centers, and practically, they were hampering their development; for instance, to illustrate, you take on packing house products, and in fact, all of the necessaries of life; they would ship from Memphis to points up the Ft. Smith road, that

is 75 miles distance from here, it was higher from Little Rock on all that class of goods than it was from Memphis, about 2½ cents, and so on up the road, and they competed with Little Rock, right from its doorstep, the first outlying posts, and when they got 75 miles above here, it was cheaper from Memphis. And then
2222 take the Iron Mountain; they hampered the growth and development of this city here so she could not go north for trade at all, on account of the interstate rate.

Q. From St. Louis?

A. Yes, and then they gave it some little advantage to points below, south, but yet when you took the combination rate, the rate from St. Louis here, and the rate to the points south, why the combination was much higher. So, it placed our trade centers at a disadvantage all over the state, that they could not possibly overcome.

Q. You say at a disadvantage——

A. Yes, sir, as compared with interstate points.

Q. Were the tariffs in such a shape that they could be understood by an ordinary shipper?

A. No, sir, not very well; an ordinary shipper, if he was a stranger—a merchant understood his rate ordinarily I suppose, but a man who wanted to make a shipment, who was not familiar with transportation or having freights billed, they could put him on most any rate they wanted to, and he would not know the difference; they had so many rates applying.

Q. They had so many tariffs they could put him on most anyone they wanted to?

A. Yes, and he would not know whether they were wronging him or not.

Q. That was pretty frequently done, wasn't it?

A. Yes, sir, they used to put him on the distance tariff; that was the highest tariff they had.

Q. What about the special rates; were there any such in force at that time?

2223 A. We found that every place in the state almost were favored shippers; those were secret rates that were not published.

Q. What were those rates, do you recall any particular commodity that they were on, how were they made?

A. Well, Morrillton got a rate, I remember that very distinctly, and the Commission came to know about it, they came and made complaint to the commission about a rate that was lower than anything above here; Plummerville could not compete with it at all, although it was in six miles of Morrillton; those were secret rates; those rates were not filed with the commission at all; we made an order on them to file all rate sheets of every character whatsoever with the commission, but those special rates they did not file.

Q. Wasn't there a great many individual rates, like milling plants starting out at some given point and they would get rates to some given city?

A. Yes, sir, I remember one very distinctly here; Mr. Denny owned some lime works out here about Batesville; he was one of

their favored shippers, and had a rate on lime, my recollection is from there here it was six cents, with the privilege of making a depot here, and then unloading it and storing it, and reshipping it — some other point, and still take another lower rate.

Q. Didn't a good many sawmills have special rates?

A. Yes, sir, a good many sawmill men and many merchants got many special favors; we ascertained all that, and in fact an industry could not start up, such as wood manufacturers,
2224 only by permission of the railroads; they would not give you a rate, whereas other men engaged at places where they didn't object to such an industry going up, could get a rate. We had factories up here, up the road here, could not go up at all on account of discriminations of the railroad; they would tell the fellow he was at the wrong place; I remember we had a mattress factory up there that could never prosper on account of the rates.

Q. At the same time then they had to have an industry and a pull both to get started?

A. Yes, sir.

Q. Were these rates, special rates, and rates to favored localities and shippers, much lower than published rates?

A. Yes, always, they were lower ordinarily, considerably lower.

Q. When you found that situation of rate affairs in the state, what did you and your associates do?

A. It took us a long time; we were at work a year; we had to first learn what the rates were, of course, because we couldn't revise or reform them until we knew about them; the people got out of patience with us, and the commission was very unpopular. The men who had been getting these favored rates, they were practically cut off; that is how we came to know so much about it; they would come to the roads and the roads would tell them they couldn't do that now, that this last legislature created a commission here, and we have got to work under their orders strictly, and they forbid and prohibit all tariffs like this, and we learned a great many
2225 of these rates in consequence; shippers would come to us, beneficiaries of these rates would come to us and make complaint.

Q. You had a pretty good size kickers' court?

A. Yes, sir.

Q. What did you do after you *find* this situation, to meet it?

A. The commission worked very hard; from the beginning, the first thing of course was to inaugurate some sort of system or arrangement, and we continued our labors until in January, before we got at all prepared to make any overt acts. Then, we prepared I believe it was in the month of January or early part of February; we prepared a rate sheet tentative in its character, and notified the roads, accompanying these notices with copies of these tentative rates. We had it prepared and served it on the roads, and notified them to appear before us for the purpose of revising—preparatory to the commission revising their rate sheets, and making a tariff covering transportation of freight in this state. They appeared, and as I have stated, the rate sheet we had accompanied with the notices was

tentative. We were not prepared to say just then that that would be the rate, but they appeared and that brought about a discussion between the roads and commission, which was continued from time to time, from about the latter part of January or early in February, meeting after meeting, until, as a result of these meetings and a thorough investigation, we promulgated a rate, known
2226 as the distance tariff, applicable to all freights in the State of Arkansas, or on railroad lines operating in this state, becoming effective, I believe, April 10th.

Q. 1900?

A. Yes. The roads met with us, and as a consequence of these meetings, of course, ideas were very freely exchanged both between the roads and the commission, and we promulgated that—we gave notice of the fact and promulgated the rate three times before we made it effective; each time they would come and show us where they thought it would be an injustice towards them; we would take out the inequality if we thought their point was well taken, and re-promulgate it, and the last meeting we had was about the last day of March, I think. That day all the lines were present, and we worked until about dark, it got so dark we couldn't see; we practically came to an understanding. I don't say that they agreed to it at all, but we came to an understanding; we had taken out and conformed to their notions in many particulars, and it was understood when we parted at heavy dusk, that we would promulgate that rate, reserving the right on the part of the commission to revise one or two commodities; we didn't want to be tampering with the rate all the time; when we put in the rate sheet, we wanted it to be a just one to the shipper and the road, and we recognized that to be constantly tampering with the rate would not be the proper thing to do; the roads would never know when they had a rate, so we
2227 wanted to put on something of a permanent character, and that was just to all, and that we could stand by, but as a final result, we reserved the right that we would revise two or three commodities at any time, which we did pretty soon afterwards, and with those exceptions the rate we promulgated seemed to be reasonably satisfactory to the road; it was to the commission, and those rates were effective when I retired from the commission.

Q. Was there much difference between the rate finally promulgated on April 10th, and that you issued as a tentative rate, about the 1st of February?

A. A very great difference; I would say the rates finally promulgated were at least a fourth higher than the first rates proposed, may be more.

Q. Why had you made this great increase, in your tentative rate, to the rate as finally promulgated?

A. The roads had stood aloof from the commission, and what we had learned from the roads, we had had to drag out of them, and when we issued notices that we were going to promulgate a rate at a different time, accompanied with this tentative sheet, that brought us together into a discussion, and that was thrown out somewhat *was* a feeler, for the purpose of getting light on the subject, and it

had the desired effect, and that brought us together in constant discussion during that time, and as a result of these conferences with them, we had arrived at just about the right thing we thought.

Q. They gave you all the information they had?

2228 A. Yes, they made figures with us.

Q. On what basis did they make these figures, and what basis did you consider in figuring these rates?

A. As a matter of course, the value of the properties had much to do with it; we considered they were entitled to a fair return on their investment, and the amount of traffic they were doing, and we thought would be done under our rate sheet; we thought it would very greatly increase traffic, because everything would move free and easy under it, and a man could locate anywhere in the state, and do as he pleased; he would simply pay as much as any other man; he would simply pay for his mileage; we believed it would greatly increase their revenues, that is, their carrying trade, and that way, they would make much more money, and at the same time, that it was a reasonable rate; that is, it was a fair compensation for their services.

Q. How did you determine or form an opinion as to what would be a reasonable rate, what data did you have before you or information before you in determining that?

A. We had their rate sheets, and their conferences with us as to what they could do the traffic for, and that influenced our action largely of course. I want to say when we parted, they were not particularly dissatisfied with the class rate; they rather, if anything, appeared to be satisfied with our class rate. Their objection was as to our commodity rates; they thought that the commodities ought to be higher, but we assured them—we had to come to some conclusion, and we ultimately did come to a conclusion, and we as-

2229 sured them at the time, that if the rates were not compensatory by an application, as that was the test at last, we would hear them, and we didn't want them to transport property in this state from one point to another at a sacrifice, and we wanted them to have a fair return on their investment, and if these rates were not compensatory, that we would revise them at any time that they could convince us of that fact.

Q. Did they ever come back, one or all of the roads, while you remained on the commission, with a statement or suggestion that the rates that you had put in were not compensatory, and that they needed revision, under your promise?

A. No, sir, we parted as I stated, with an assurance of that kind, late in the evening, and they never did complain*t* to us about the rate any more.

Q. How long did you remain on the commission after that rate was put in?

A. That rate was put in April 10th, 1900; I remained on the commission until about February 8th or 10th, 1903.

Q. Were they making you statements of their business while you remained on there?

A. Yes, sir, they made annual statements.

Q. Did you keep informed as to their returns, and form an opinion as to whether they were doing well under the rates?

A. Yes, sir, reasonable so; we had an expert that we de-
2230 pended on very largely, but still we didn't depend altogether on his statements, we investigated ourselves, and it seemed they were making a fair return on their investment; we had their annual returns.

Q. In making these rates, particularly after you got in conference with railroad people, did you have tariffs of other states before you to consider what was being charged under like conditions in other states?

A. Yes, sir, we had collected up that before we invited any conference with them; we had informed ourselves as to the rates prevailing elsewhere.

Q. How did your tariff, as finally promulgated, compare, speaking generally, with tariffs of other states situated similarly with Arkansas, and with about the density of traffic of Arkansas?

A. Well, our rate was a reasonable rate; that is, it was reasonable fair to the people, and we thought to the roads, as compared with that of other rates prevailing in other states; there were states that had lower rates than we put in, eastern states, but we had about as low a rate as any of these western states.

Q. About on a level with them?

A. I think we had a fairer rate than any of them to the people, but still I believe at the same time, it had the possibilities and potentialities of more money to the railroad than any of them.

Q. You thought it would be a better revenue producing tariff than that of the other neighboring states?

A. Yes, sir, I thought it was a better revenue producer,
2231 and better all around, both for the people and for the road, though it was in some respects lower but we found no other neighboring state that had a tariff made strictly on a mileage basis; that is, it was on a mileage basis, but it had its points where they had a right to charge so much differentials, etc., and it was so plain—our idea was that the rate ought to be so plain that just an ordinary man that was unskilled in anything of that sort, ought to be able to take his rate sheet, and see what he wanted to transport, and tell what he was entitled to, tell what the rate was; we claimed that was one of the virtues of our rate,—its simplicity.

Q. How did your rates compare generally with these secret and special rates?

A. Those special rates were much lower than anything we had; all their special rates were lower than our rates. We never got hold of many of their rate sheets; they didn't send them in.

Q. It was only as you learned it in individual cases?

A. Yes, sir.

Q. Do you remember the old distance tariff sheet of the Iron Mountain Railroad?

A. I believe I would know it if I would see it; I remember it was very high.

Q. Wasn't it a very old tariff?

A. I am told it was one of the first sheets that the old Cairo and Fulton, the rate sheet that they had promulgated and handed
2232 down; of course it had been often revised. That is history; I don't know that to be a fact, but I think it was so understood among railroads that that was the old ancient sheet first promulgated by the old Cairo and Fulton Railroad.

Q. You say it was quite high?

A. Yes, sir.

Q. When they applied it to some intermediate point that didn't have a jobbers' rate or local rate, a man operating under that would have to pay a much higher rate than other places?

A. Yes, sir; I don't say it was the first rate or a copy of it; that was the understanding, I think, in railroad circles; I so understood it, and they never denied it.

Q. Would you and your associates upon the commission, while you served there, been ready at any time, if the railroads had shown you that the rate sheet you promulgated was non-compensatory, to revise it so as to give them more revenue?

Question objected to by Mr. Moore, Attorney for the plaintiffs.

A. I could only answer that as I did before, that they never asked it; we assured them that we would, but they never asked it; I think the commission would have done what was just in the premises.

Q. You made that assurance in good faith?

A. Yes, sir, but at the same time, we would have required a showing.

2233 Q. If they had shown you it was non-compensatory, you would have?

A. Yes, sir.

Q. In making these various rates, didn't you have authority in their own rate sheets for more or less of them?

A. There is not a thing in our rate sheets that we didn't find either from their special or general rates; the only thing was that ours was general and theirs was not; that is the difference.

Q. You made yours apply to all alike and they made theirs apply to special interests?

A. Yes, sir, they had much lower rates than anything we published; I don't mean general rates, but considering their special rates; they wouldn't average lower, of course; they would average much higher.

Q. Did you observe the effect of your tariff upon the traffic of the state, as best you could?

A. Yes, sir, it was just like magic on this state; I don't know whether it was due to the rate or not, but something quickened the energies of the people, and our trade centers have been extremely prosperous ever since.

Q. It is your opinion that the discontinuance of that old system and putting in this one, was a factor in that?

A. Certainly, it very largely contributed to it; notwithstanding all the good times we have had, if our trade centers had been sub-

ordinated to these interstate points, they could not possible have developed as they have.

2234 Q. In making these rates, did you take into consideration the length of the haul, in fixing the rate, and graduate the rate accordingly?

A. Yes, sir; I want to say this, that you can only approximate, it is not like a mathematical problem, but you have got to take the data and judge what its influence would be from that; we couldn't figure it out—we thought we were establishing a basis which would make both roads and the country prosper, that the remotest part of the state could develope whatever character of industry they wanted to engage in, and their country was adapted to, that their energies would drift off in that character of production, and it would furnish increased freights to the road, increase their transportation, and at the same time, be good for the country, and everything moving free and easy, and we tried to make it as analogous to nature as possible, letting every man pay for his mileage.

Q. Do you remember a clause that you put in the tariff—I believe it was in the first one—to this effect, that where there was a published rate lower than your tariff rate, that that rate would apply?

A. I don't believe there was any such provision in the tariff, I am not sure.

Q. It is in one of those, judge; I want to call your attention to it; if I remember it correctly it provided that where there was a published rate in force, lower than the rate called for in that tariff, that that published rate would be the rate to control; do you

2235 recall that?

A. It don't occur to me at this time, no, sir; they may have had such a provision, but I cannot imagine a condition to which that applied; under the law, where they had to compete with water transportation, there might have been such a provision or something or other, that they would be allowed, where there was a water rate, they would be allowed to compete with that by reducing the tariff even below anything we had; that is, they might make their own tariff; they couldn't make it higher; they could compete with water rates; I know that was a uniform ruling with the commission; I don't remember whether there was any clause of that kind inserted in the sheets or not.

Q. I will refresh your memory by showing you the tariff when I get it.

A. I think may be that will be found in the rules about water rates, and the right to reduce their rates.

Cross-examination.

By Mr. MOORE:

Q. When were you elected to the commission?
A. I was first appointed.
Q. That is what I mean?
A. I qualified the 11th of March, 1900.
Q. Who were your associates on the commission?

A. Judge Neal and Judge Wells.

2236 Mr. HILL: I think you have your years wrong, Judge?

A. Yes, sir, it was March 11th, 1899.

Mr. MOORE:

Q. When did the commission organize?

A. We organized within a few days after, about eight or ten days, but we were a long time getting on a working basis; that is some time; we had to do a great deal of work before we could take action, more than to require the roads to send in their rate sheets.

Q. When did you get on a working basis?

A. It depends on what you call a working basis, or what I might term it; I will interpret it from my own standpoint; we went to work in a month, but we didn't know anything about rates; we had roads forwarding their rate sheets, and they forwarded everything in compliance with the order, except special rate sheets; I suppose they stopped that, and didn't consider them effective any longer, and we went to work first to arrange it and the organization of a body like that, not having succeeded an organized body, it took some time to arrange it, but we went to work and learned their rate sheets, just as soon as we got thoroughly installed.

Q. How long did it take you to get in their rate sheets?

A. They forwarded them in about ten days after they were ordered, within the time we had given them.

Q. None of the commissioners had any experience in rail-

2237 road matters?

A. None of us, I never had.

Q. You were a practicing lawyer?

A. Yes, sir.

Q. Didn't you say Judge Neal was also a member?

A. Yes, sir.

Q. He was also a lawyer?

A. Yes, sir.

Q. Who was the other member?

A. Judge Wells, a practicing lawyer.

Q. None of you had much experience as shippers?

A. None of us had been very large shippers over the road, just occasional shippers, I suppose.

Q. So it was an entirely new chapter in the experience of all of you?

A. Yes, sir.

Q. When did you get our your first tentative tariff?

A. I think that was about the latter part of January; it might have been some time about the 1st of February.

Q. That is 1900?

A. Yes, sir, nearly a year after our appointment.

Q. What data did you use in preparing your first tentative tariff?

A. We ordered the rate clerk to prepare a tentative tariff and we trusted that largely to him, although we had discussions all along;

Judge Neal, in the meantime, had retired from the commission, and Judge Hanley had succeeded him.

2238 Q. At what time did Judge Neal retire from the commission?

A. I think he retired some time recently before Christmas of the year he went on.

Q. Judge Hanley was then appointed about the last of the year 1899?

A. Yes, sir.

Q. I think I interrupted your statement as to the data upon which you formed your first tentative tariff?

A. We had all been studying; we had got the rate sheets of other states, Texas, Georgia and all of the surrounding states; we had all been laboring, but we had employed a man that we regarded as possessing some skill; we deferred largely to him; he prepared this tentative sheet; that tentative sheet was prepared more for the purpose of bringing the commission and the roads together, meeting face to face, and discussing the question; it was really not intended at the time, to make that effective, unless, after discussion and consideration, and having the benefits of what information we could receive from the railroads, we found it to be just, but I don't think any of us thought that that would be promulgated.

Q. Your conference with the representatives of the various railroads in the state began after the first tentative tariff sheet was prepared?

A. Yes, with respect to the promulgation of this rate now effective, although we had more or less conferences but not invited; railroad men were visiting the office all the time, and rates had been discussed with them, but not in invited conferences pre-

2239 viously.

Q. When did the conferences begin, about what time?

A. I think it was in February, my recollection is; of course, we get mixed up on dates sometime,—that this tentative sheet was sent out about the latter part of January, and it was something like 20 or 25 days perhaps before we gave notices that we would promulgate it; that led to conferences, conference after conference; in fact some of the railroad rate men was in nearly every day, and along the latter part, they would all come every day, in many instances.

Q. You had gotten in pretty much all the rate sheets, had you?

A. We got the rate sheets in recently after we qualified; the roads responded by sending them in when we notified them; we had learned what their rates were.

Q. You stated, if I understood you correctly awhile ago, that you didn't get some—perhaps you said many—of these special rate sheets? Now, I want to call your attention to a statement made in the affidavit which you filed in the hearing before Judge Trieber, and for the purpose of asking you if you cannot be mistaken in the statement you just made; you said in that affidavit "during all this time we were at work; we had their rate sheets; what they didn't furnish us with, we managed to get; we got pretty nearly all they

had, both special and general." I am reading that for the purpose of calling your attention to it, and to ask you to reflect a
2240 moment and tell us what your recollection is?

A. That statement there is true; what I meant in that statement is, that what we didn't get from the roads themselves, we got from others; those special rates ordinarily they came to light by complaints of shippers.

Q. And you did, in fact, get pretty much all the special rate sheets?

A. Yes, sir, but we didn't get them from the railroads; they sent in some; my recollection is that worked out a discrimination, but ordinarily, we got them from the shippers, or from other sources than from the roads.

Q. I believe you said you also examined rates in effect in other states, both east and west? Those surrounding Arkansas?

A. Yes.

Q. And I believe you stated while your rates were higher than some of the eastern states, they were lower than some of the surrounding states?

A. Yes, sir, I think they would have averaged lower than some, and higher than some; I can't say that we put in the lowest rate; I don't think we did, nor can I say; I can say this though, that our rate was a better rate, in my opinion, and in the opinion of the commission, than any of these states, although they might average higher than any of these states, but at the same time, I think the surrounding states would average higher than ours.

2241 Q. In what respect did you think the rate prescribed by your commission was superior to rates in surrounding states?

A. Its simplicity was one thing; any unlettered man, any man that could read, could tell the rate and then it moved everything strictly on the mileage basis; in other states, there was some more or less confusion to a man who didn't understand rates, about how to figure out their rates.

Q. Was the old system observed by your successors?

A. Yes, sir, I think so.

Q. Have you followed that up so you know?

A. No, sir, I didn't; I started in, after I left the Commission to keep up with it, but somehow or other, I failed to receive the literature after a year or so, and I haven't kept in touch with it.

Q. Have you observed the joint rates that were put in by the commission after they were empowered by supplemental statute to put in joint rates, and its effect upon your mileage scale?

A. No, sir, we had no power ourselves to make joint rates. The legislature gave them the power subsequent, to make joint rates.

Q. You have already stated that the members of the committee were all inexperienced in transportation matters; it is true, isn't it, that you had great difficulty in your investigation of this subject of arriving at results that were satisfactory to yourselves, on
2242 account of your inexperience?

A. Most assuredly, yes, sir.

Q. You found, didn't you, that it was a vast subject, one that re-

quired a great deal of practice and experience to enable a man to understand it properly, did you not?

A. Yes, sir.

Q. Let me ask you if the tariffs you put into effect on the 10th of April, 1900 was entirely satisfactory to the Commission, and if you didn't feel some doubt about how it would operate, growing out of your inexperience in that kind of work?

A. Well, we didn't know how it would work; we thought it was a good rate, and from the fact that we parted with the railroads, with assurances that if it didn't make money for them, to come back, we were ready to hear their complaints, and they never returned, and from the fact that it seemed to stimulate all of the industries of the state, we concluded it was a good rate; by subsequent events, it seemed to demonstrate that it was a good rate.

Q. You stated you prescribed a fairer rate for the people than any of the surrounding states had, what do you mean by that statement?

A. I stated, in my opinion, we had the best rate.

Q. The point I want to call your attention to, is what do you mean by stating "a fairer rate to the people?"

A. I meant by that, that it was not very much lower than
2243 others or that its effect was such as to put the people of all parts of the state on one common equality; if it didn't operate to lower the rate, that it nearly equalized it, and put every man upon his merits with reference to every other shipper in the state, more than any other tariff that I know of.

Q. I understood from the testimony of Mr. Bragg who was on the stand a few days ago, and I understood that to be the drift of your statements, that the tariffs you found in existence at the time you organized the commission recognized jobbing centers, and a great many special rates were given from jobbing centers to outside territory; that is to say, territory that was tributary to different trade centers of the state, is that correct?

A. Not our tariff.

Q. You don't understand me; I say—I am speaking of the railroad tariffs that you found in existence——

A. Yes, sir, that was practiced very largely; my recollection is on the Cotton Belt principally; they all recognized the jobbing points more or less, but they also had in effect at some places, what was called jobbers' rates.

Q. What were those?

A. As I explained awhile ago, that was a much lower rate than the distance tariff from the jobbing point, to *to* the outlying posts.

Q. Now, to illustrate what I mean, take Little Rock as
2244 an instance; Little Rock was the center of a trading district which was tributary to it; when you speak of jobbing rates, you speak of favorable rates that were given to Little Rock, within the territory that traded there; do I understand you correctly, as meaning that?

A. State that question again.

Q. Assume that Little Rock was a jobbing center——

A. Yes, it was.

Q. I understand that these special jobbing rates you speak of, were such as included jobbers, merchants in Little Rock, and permitted them to ship their goods out within the territory that traded at Little Rock, at a lower rate than their mileage rate or that people in the country could get in shipping back to Little Rock?

A. Yes, it was a lower rate, a much lower rate than the distance tariff; in fact, it belonged to that species of rate called combination of rates; for instance to illustrate, the rate from St. Louis to Little Rock is so much, say 20 cents per hundred; then you want to ship out of Arkadelphia; they give the rate through then, they take the combination of the rate from St. Louis to Arkadelphia, and the rate from St. Louis here, and this jobbers' rate is made up more of the combination; of course, something is allowed I suppose, for loading and unloading.

Q. What jobbers' rate do you refer to?

A. I am speaking of the jobbers' rate and not the local

2245 rate.

Q. You are speaking of the jobbers' rate out of Little Rock to Arkadelphia?

A. Yes, sir, it wasn't a to and fro rate.

Q. Well, it was the same from Little Rock to Arkadelphia or Malvern or Benton, or any points within the territory?

A. Yes, sir.

Q. And the same from Pine Bluff to points tributary to that?

A. Yes, sir.

Q. Those rates were lower than the regular rates?

A. Yes, sir.

Q. Why were these jobbing centers favored in that way?

A. I didn't have a very serious objection to the jobbers' rate; I never thought there was; it was fairer than the local, because it consisted of a combination of the through rate, and if they had observed that all over the state, but they didn't do that, it was the most favored points where that was done.

Q. What were the jobbing centers of this state at the time commission was organized?

A. We called a jobbing point any place where they did a wholesale business.

Q. I wish you would designate what were the jobbing centers at that time; Mr. Bragg named them as Little Rock, Van Buren, Pine Bluff, Texarkana, and possibly Camden?

A. That is correct.

2246 Q. That is about five jobbing centers; did this system of jobbing rates prevail at these several points, under the railroad tariffs that were in existence when your commission was organized?

A. You mean did jobbers' rates prevail at all these points?

Q. Yes?

A. I don't think it did, although to some extent it did.

Q. I think your testimony in that respect is different from Mr. Bragg's. Mr. Bragg testified that there were jobbing rates going to these different trade points?

A. I only said if all jobbing points in the state had it, I don't think they did, I think the shippers, particularly jobbers, at each point had it, wherever they had a favored shipper, they would give him the best rate they had.

Q. These jobbing rates had a tendency to build up trade centers in the state,—jobbing centers?

A. Yes, it put them on an equality with interstate points; there was a slight difference, slightly more than if they had bought it in the first place from St. Louis.

Q. The reason I am leading up to, I understood you to state on your examination in chief, that through the operation of these general and special tariffs, that railroads had in force before the commission was organized, it paralyzed business and kept trade centers from being built up in cities of the state; I don't think that was your language, but that was the effect of what you said,
2247 as I understood it; am I correct in this?

A. Yes, sir, these jobbers' rates, the commission would not have complained of if they were general; some points were favored more than others.

Q. Weren't there jobbing rates to certain points and certain special rates given to favored individuals, which you denominated discrimination?

A. Yes, sir, they had a jobbers' rate locally, that was a to and fro rate, but the regular jobbers' rate is a rate out from the jobbing center; that is my understanding; it wasn't given to all the jobbers, and thereby worked a discrimination.

Q. Now, your commission had no jurisdiction to regulate rates into jobbing points from other states?

A. We could influence them, but not regulate them.

Q. In what way could you influence them?

A. We could influence them in this way,—that would be hard to explain, but interstate rates are influenced more or less by local rates; for instance, rates consist of a combination of the locals; in interstate commerce, the through rate cannot be higher than the combination of the locals; freight rates are lowered here and that cuts down the combination of the locals, and in that way it influences interstate rates, especially inbound rates.

Q. Why do you say that the through rate, the interstate rate, cannot be higher than the combination of the locals?

2248 A. That is a rule of rate making, and it is based on the long and short haul clause of the interstate commerce law.

Q. Would such a rule as that be impractical to operate under a different rule from that, I mean from a business standpoint, I want to understand——

A. I am inclined to think that if the through rate was higher than the combination of the locals, it would be a discrimination.

Q. At any rate, it is your understanding that the rates prescribed by your commission, did in fact influence interstate rates?

A. I think so.

Q. Did you ever give any attention to that matter?

A. No, sir, I never thought anything in that line?

Q. In observing the tariff put in by the commission, did you notice it had any such effect as that?

A. I don't know that I did.

Q. You said awhile ago, that your impression was that many special rates were lower than the rates prescribed by the commission; I want to call your attention to a provision contained in the standard freight distance tariff, promulgated by your commission at the date you mentioned, April 10th, 1900, on page 14, to the effect that when class rates, carloads and less than carloads and commodities carloads and less than carloads, now in effect from jobbing centers to local points, and between jobbing points and other points
2249 in the state are lower than the rates prescribed in this tariff, such lower rates shall govern; didn't that have the effect to give the shipper the benefit of the lowest rate?

A. Yes, sir, I think so.

Q. I believe railroad companies, each of them published their own tariff, based on a copy of the tariff promulgated by the commission, when the commission rates went into effect?

A. Yes, furnished their own rate sheets.

Q. Yes, they printed their rates for themselves?

A. Yes; I am not sure about that, but I am inclined to think they did.

Q. For the purpose of refreshing your memory, and calling the matter to your attention, I want to hand you copy of your tariff, which was printed and put into effect by the St. Louis Southwestern Railroad Co., which contains on it, stamped on it in red letters, in effect a protest; it is a statement that the rates are put in under protest, and with reservation of the right to contest them; I do that for the purpose of asking you——

A. That is a fact; it was understood they went in under protest; that was understood by all the roads; I say with all the roads; I know it was with the Iron Mountain and Cotton Belt, and we told them it was so understood with all; I don't think that the other roads especially reserved the right, but it was understood by the commission that they were going in under protest, but I
2250 think the Cotton Belt and Iron Mountain especially reserved in the face of the rate sheet here, their protest.

Q. In preparing your schedule of rates, did you make any investigation as to the cost of service and operating trains?

A. Yes, we considered that the best we could. We found out this, that nothing but actual tests will demonstrate a rate at last; that railroads themselves cannot sit down and figure by any rule, they can approximate but they cannot figure out what would be just the rate, but they simply put in a rate and apply it, and if they don't make money on it, they take it out and keep putting in higher rates until they get one by which they can make money; there is a great deal of speculation; of course, men sitting down here, it is all well enough to consider all these things and they do, but then at last, that is the test.

Q. Did the commission and did you, who were the members of it,

give any recognition to the principal that the cost of service should be considered and recognized in preparing rates?

A. Yes, sir, and we were going to do just like the railroads, if it didn't make the money, we were going to take it out and put in one that would make money, a reasonable profit—a reasonable return.

Q. Did you discuss the proposition of the cost with the railroad people?

A. Not so much with the railroad people; we had reports there, had them all complied, what other roads cost, and their
2251 traffic, the value of it, and all that sort of thing, and they entered materially into the consideration in establishing freight rates, but from that, we could not have taken it and figured out just what would have been six — interest on their investment or anything of that sort; we thought from all the information before us, that we were putting in a fair and reasonable rate, one that was just to the roads, and also one that was just to shippers; we considered those things.

Q. In considering the subject referred to in your last answer, that is the cost or expense of operating trains, and what would be a fair return, did you have in mind what is cost railroads to procure material and labor, and essentials of that kind, that entered into the operation of trains and the maintenance of the road?

A. Yes, sir, we investigated all that; we got first, the capacity of the cars, the minimum capacity, and what it would cost per mile to run a train; how much it cost to start up and how much it cost each mile; I did know just what it cost to operate a road per mile after it was started, after steam was raised; we had that up; I don't know whether it was preserved or not; estimating the cost and tonnage, number of cars in the train, and what the average tonnage was, that depends of course upon the character of freight itself; some freight is bulky in proportion to weight, while other freight is very weighty in proportion to bulk, but when we took charge, I believe the minimum weight of a car was 24,000 lbs., and we
2252 figured on that basis largely. We figured all those things out, and the cost of operating trains, and on the minimum basis of what they would haul, and also the differences between the cost of a through train, and what you call a train handling pound freight, set-out and set-in freight and local freight, but after we had figured on it all, of course, we couldn't, with mathematical certainty, fix a rate that we could say would be compensatory. We were influenced by many things, and at last, we had to trust largely to experience, to actual test, actual application of our rate, and just as I said awhile ago. I found out that was the way railroads made rates; they put in rates, they applied them, if they didn't make money, they took it down, and put in another, and so on until it did yield a revenue.

Q. What investigation, if any, did you make as to the value of the property, in determining what you thought would be a fair return in the way of compensation?

A. We didn't make any estimate further than that furnished by

the railroads themselves; we included all betterments down to that time, cost of their road; we had no experts, the state didn't furnish us any; we had no money, and it was not practical for us to enter into that inquiry very extensively.

Q. Did you establish any basis as to what would be a fair compensation with reference to the investment, and what the property represents?

A. Well now, there was the Cotton Belt for instance; my
2253 recollection is it had its road down to $86,000 a mile, and the Iron Mountain about 56.

Q. I am not speaking about that; upon what basis of profit or earning, did you assume a fair compensation or return could be made, in the way of percents, say two or three, or four or five or six per cent on the investment represented by the property; what do you consider would be a fair return in the way of profit in per cent?

A. We had to consider what their indebtedness was, of course, and the value of stocks and bonds, and we thought that our tariff would yield a reasonable return.

Q. What did you consider at that time would be a reasonable return on the value of the property?

A. I don't know that we had any discussion among ourselves about any particular figure that it ought to be, but we believed that the tariff was not only a fair compensation for the service, but also, it was a reasonably fair return on the investment; just as I have said, we had no way of arriving at a mathematical certainty in that regard.

Q. What, in the view of the members of the commission, would have been a reasonable return in the way of interest on their money?

A. I would have thought it ought to have been legal interest at least?

Q. That is 6%?

A. Yes, sir, although I believe the courts have held that it must be some return; I don't believe they have said how much it
2254 is; I wouldn't want to be put in the attitude of saying that was right, but my idea is that a man for a large investment, with a return at a low rate on a very large investment——

Q. What I want to get at was the idea of the commission at that time, the idea upon which they acted at that time; in estimating on the rates, whether it ought to be five or six per cent?

A. We didn't figure on that; we thought it would be a reasonable fair return.

Q. I reckon you were pretty careful so as not to make your rates so they would make more than a reasonably fair return?

A. We thought we were pretty liberal; we gave the benefit of the doubt to the railroads.

Q. Have you kept yourself informed as to the relative costs of operating railroads in 1900, with what it is now, that is, the changes that have taken place in the prices of those things that enter into the operation of a railroad; that is the material that enters into the maintenance and betterments, that enter into the operation of a railroad, and the labor?

A. It is very much greater, I know; I have not had any occasion

to think very much about it; I know that everything is very much more costly,—labor is almost double what it was.

Q. The cost of living is very much higher?

A. Yes, sir, the cost of everything is higher; everything
2255 that enters into a railroad, as well as labor; all material has increased in price.

Q. That is true of nearly all industries and manufacturing concerns in the country?

A. No question about that.

Q. Isn't it true, don't you know as a matter of general intelligence and public information, that all the manufacturing and industrial concerns in the country have been obliged to raise the prices of their product and their output, on account of the increase in the expense of manufacturing, growing out of the higher prices?

A. I know that as a matter of general information, yes, sir.

Q. If that is true with other industries, would it not be fair and proper that railroads should be allowed to increase their rates, if the cost of producing the service has increased in proportion to other industries?

A. Most assuredly; I don't think there is any doubt about that

Q. The rule would apply to all industries alike?

A. Yes, sir, but you have got to consider this; now, as the prosperity of the country increases, and the latent energies of the country are roused and resuscitated, that it very materially increases the amount of traffic.

Q. Isn't the effect of that though, if the rates are insufficient, to increase the loss that will grow out of operating at insufficient rates?

A. Yes.

2256 Q. And still on the other hand, it would increase the profit, if the rates were fair and reasonable?

A. Yes, sir.

Q. In that same connection, isn't it a fact, isn't it an axiom that the growth in volume of business isn't profitable unless there is an equivalent growth in the prices that are charged for the output of that business?

A. I think there ought to be some increase in the compensation; that would be my idea, although a part of that increase, as I have just stated, is made up by the increased volume of business, there ought to be some increase.

Q. It is a rule that works both ways, that an increase in production, without a fair and ratable increase in the compensation, would be a misfortune; that is an axiom that you recognize as true?

A. Yes, sir.

Q. And it applies to railroads as to anybody else?

A. Yes, sir, railroads are entitled to share in the prosperity of the country the same as individuals, and ought to share slightly in its diversities.

Q. I want to ask you this question, and I ask it because I want to get your views on that subject, in view of the condition of prices of everything that enters into the construction, operation and main-

tenance of railroads; now, do you believe a rate that would be fair in 1900 would be fair today on the railroads in Arkansas?

A. I am inclined to think that it is more than likely
2257 that the road would be entitled to some increase; however, as I stated awhile ago, they are compensated in the way of an increase in the volume of their business, but still—I will say yes, I think they are entitled to some increase, but I won't undertake to say how much.

Redirect examination.

By Mr. HILL:

Q. Hasn't the capacity of cars increased very largely since 1900?
A. I think so; you mean the carriage capacity?
Q. Yes, sir?
A. Yes, sir.
Q. Very largely?
A. Yes, sir.
Q. Hasn't the power of the locomotives increased very largely?
A. In proportion, I suppose.
Q. Haven't railroads spent a great deal of money in Arkansas in reducing grades and taking out curves?
A. Yes, sir, that is my observation; that is, up this road I live on; I haven't been on any other, in many other parts of the state
Q. Those facts all tend to less the cost of traffic, do they not?
A. Yes, sir, most assuredly; there is a large outlay, however, to make those improvements, but they certainly tend to decrease the cost of carriage.
2258 Q. And of course, you would have a return upon that outlay?
A. Yes, sir.
Q. When you put in this commission tariff in 1900, I suppose engines were very much smaller than they are now, and freight trains very much less in number of cars carried?
A. Yes, sir, I think so; in fact, I know so; that is according to the capacity of the car, very much increased.
Q. Now, when the density of traffic increases, to which you have referred awhile ago, doesn't that lessen the cost proportionately?
A. Well, it lessens the cost; I can't say that it would raise it up to a given increase; it is hard to figure on these things.
Q. Take for instance in 1900, that a freight train drawing 15 cars, that was all the load it had, and it served to carry all the traffic of that day upon its run, and today that engine would be carrying 30 or 35 cars, on account of the increased volume of the traffic, and those cars would be very much larger than they were then, wouldn't the cost of that transportation be lessened by reason of those facts?
A. Compared with the amount, it would be very much lessened.
Q. Per ton per mile, reduced to that basis.
A. Yes, per ton.
Q. When you consider whether the rate should be higher or lower

than it was in 1900, on account of the increase in *in* wages
2259 and material and various other matters, you have mentioned, you should also consider whether or not this increased traffic and increased minimum in hauling that traffic, hasn't counter-balanced that, should you not?

A. Yes, sir, but you have to take into consideration also in getting at a basis, the increase in price as well, material and labor and everything of that sort.

Q. On the other side, are these other things and probably many more than I have mentioned?

A. Yes, sir, there are many things to be taken into consideration; all we know today is it is increased, but it would take a very thorough expert to figure out what ought to be the increase, and what is the increase in the cost.

Q. And in adjusting rates, those two effects should be taken carefully into consideration?

A. Yes, sir.

Q. If a railroad was making all of its fixed charges, paying 6% interest on a very large bonded indebtedness much larger than its assessed valuation, and paying 10% annual dividends upon a very large capitalization, very much larger than its assessed valuation, would you think that road needed any increase of rates?

A. I would not think so, no, sir.

Recross-examination.

By Mr. MOORE:

2260 Q. Judge Hill called your attention to large expenditures which were made, which resulted in increased facilities, made by railroads in conducting their business; you would say, wouldn't you, that railroads were entitled to a fair return on the additional investment that is represented by those additional matters?

A. Yes, sir.

Q. It is evidence in this case, that there has been really millions of dollars spent on these railroads, and that no doubt those improvements have increased the efficiency of the properties, but it would be a very unjust rule not to allow them a fair return on the money invested?

A. Yes, sir, they ought to have a return on the betterments, of course.

Q. Another thing, there are two sides to every question; your attention was called to the enlarged capacity of locomotives; it is a fact that it does not require an expert to know, that as you increase the size and capacity of locomotives, that you increase the cost of operating them,—fuel and water, etc.

A. Yes, sir, it might not be in proportion, but it would increase it some.

Q. Your attention has been called to the fact of the enlarged capacity of cars; now it is in evidence in this case, that every car, large or small, is what is called dead weight; it is non-remunerative;

it is hauled frequently empty; every car is a certain weight,
2261 independent of its remunerative tonnage; all that is included in dead weight; now, as you increase the capacity and the size and the value of cars, the cost of dead weight and the cost of hauling them empty is increased to some extent?

A. Yes, sir.

Q. You consider it fair to take all those and many others that I shall not enumerate into consideration?

A. Yes, sir.

2262 W. E. FLOYD, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. State your name, residence and occupation?

A. W. E. Floyd, secretary of the railroad commission, Little Rock.

Q. Have you custody of the records of the Railroad Commission?

A. I have.

Q. I had Mr. Swaim to put in evidence in his testimony statements from the records of the Railroad Commission of various changes that had been made by the Railroad Commission between July, 1903 and September, 1908, which reduced or tended to reduce the freight rates,—revenue—I have asked you to prepare data from the records of the commission of various petitions that were presented to the railroad commission, within that time, which did not result in reducing the rates; I ask you if you have prepared that?

A. Yes, sir, I have.

The statement containing summary of the orders is hereto attached as a part of this deposition, and marked Exhibit "D", and the summary is herein accepted by the plaintiffs, the same as if the original records were copied, subject to all objections as to competency and relevancy?

For Exhibit "D", see Volume 9, page 5772.

2263 J. G. WALLACE, being recalled, deposed as follows:

Direct examination.

By Mr. HILL:

Q. You stated to me this morning that you wanted to correct a statement that you made yesterday, and I would be glad to give you an opportunity to do so? What was the matter?

A. Mr. Moore asked me the following question yesterday; in substance: Does the intrastate rate influence the interstate, or does the interstate or intrastate rate—does it influence the interstate rate, and if so, how? I did not understand, my hearing is not very acute, I did not fully comprehend the question; I got started off wrong and got confused, and got mixed up with the long haul, and I wanted an opportunity to answer that question, to correct my answer this

morning. My answer is yes, it may in some instances do so; to illustrate, prior to the promulgation of the commission's tariff, the Frisco Railroad had interstate rates effective at stations in Arkansas, north of Ft. Smith; that is on its line north of Fort Smith, with which the Ft. Smith jobbers could not compete; it gave the Missouri points practically a monopoly of that trade, or at least it was so represented to the commission. The effect was to give the
2264 trade to Missouri points, and stations on the line of the Frisco, north of Ft. Smith; as a consequence, the Commission's tariff had the effect—its local rate which was effective anywhere in Arkansas,—had the effect to just reverse the order of things, and transfer that trade at all stations north of the line practically to Ft. Smith, and then, of course, the Frisco would have had to lower its rate from St. Louis and other interstate points in Missouri, north of the Arkansas line, in order to have enabled those interstate merchants,—that is, interstate as to us, to compete with the Ft. Smith jobbers; now, the same condition of things was applicable in some instances, as to a portion of the traffic of all through long line roads. The effect of it would be, of course, not necessarily as I understand it, reducing their revenues or income, but lowering the rate so as to give Arkansas competitors, as to all that traffic an advantage, while between Fort Smith and north of the Arkansas Line——

Q. If I understand you correctly, it is about this, that in certain trade centers; the intrastate rate will influence the interstate rate, but it is not necessarily a reduction, but a readjustment of the revenue, whether it shall be intrastate or interstate; is that the idea that I gather from you?

A. It is not necessarily a reduction; it is a reduction of the rate, it is not necessarily any encroachment upon the revenues;
2265 they might make more money as a consequence, or they might lose.

Q. It amounts to this, that whatever influence an intrastate rate may have upon an interstate rate, it is an influence in the distribution or re-distribution of the revenue, rather than a change of the revenue itself?

A. Yes, sir, a legitimate distribution of the burdens of transportation, which we all have to bear more or less.

Q. There was one question I wanted to ask you yesterday, and forgot it, and that is, whether this clause in your tariff, requiring the lower rate to be taken where there was a lower rate prevailing, had the effect or was intended to have the effect of continuing the special rates and jobbers' rates of various kinds that had been in effect before the commission tariff was promulgated?

A. I have not looked at the tariff for a long time, in a good many years, have not refreshed my memory; I should have before coming here to testify, but have not, but I can state in most unqualified terms, that no road, neither did any road so understand it, that they could vary their rates from those rates, only where the circumstances were exceptional; now, if there was water competition, they were at liberty to adopt the water rate to compete with it, but if they adopted

it as to one shipper, they must adopt it as to all, and where there were competing lines, take Fort Smith, there is two roads leading
2266 from Fort Smith to this point; the long line road might adopt the short line mileage, and again, occasionally there was a man that wanted to move, change his place of residence forty or fifty miles, and he had a cow and a horse that he wanted to take, and he could load his chattels, and if he didn't have enough for a carload, didn't justify him to get a car, why that we considered to be, we found decisions in exceptional cases, and allowed the road to give its own rate, with the condition, however, always that they gave everybody under like circumstances, and similarly situated, the same rate.

Q. That was intended and was not construed by the railroads, as a continuation of any of the special rates or jobbers' rates, or local rates?

A. No, sir, not at all; I don't think a railroad man so understood it; I never heard of such a construction being put upon it.

Cross-examination.

By Mr. MOORE:

Q. After Mr. Hampton became a member of the commission the shippers and jobbers of Texarkana made an application to the railroad commission to reduce the rate on sugar by putting in a maximum rate for 300 miles, reducing it to 13 cents,—it had previously been 15 cents—the Texarkana merchants were com-
2267 plaining of the rate to New Orleans; that rate had been fixed by the Kansas City Southern Road, which was the most direct route shipping by Shreveport from New Orleans to Texarkana, in order to accom-odate those merchants the commission did make a reduction of the maximum rate on sugar in this state, of two cents a hundred, reducing it from 15 to 13 cents; Mr. Hampton made a statement that there was no traffic in this state on sugar, originating in Helena, but it came from other points outside of the state; the object of making that rate was to influence the interstate rate and bring it down, and it did have that effect, because the rate from New Orleans to Helena was 10 cents; under their order from Helena to Texarkana, it was 13 cents, the sum of the locals being 23 cents and did have the effect of reducing the rate from New Orleans to Texarkana on the Kansas City Southern from 25 to 23 cents; that illustrates, doesn't it, the manner in which the reduction of intrastate rates affects interstate rates?

A. Yes, that is true, but then a shipper may always take advantage by reconsignment, etc., and avail himself of the lowest rate.

Q. That is the reason the sum of the locals controls?

A. Yes, we had some trouble on that line, before I went off the commission; we never could get the Texarkana people—that happened after I went off the commission, Mr. Hampton you
2268 stated was on the commission after I went off—we tried to effect that arrangement before I went off the commission; we couldn't handle the Iron Mountain; they had been shipping heretofore, and reconsigning from Helena, but I believe there was no com-

petition with the Iron Mountain at Helena, and from some cause or other, if it had competition, we couldn't get it to compete with it on that line, so we considered that legitimate for the shipper to avail himself of the lowest rate, and he might, by taking the combination of the locals, get a lower rate than the through rate in some instances; ordinarily, such would not be the result.

Redirect examination.

By Mr. HILL:

Q. You say you tried to effect that sugar readjustment, did you think that the rate to Texarkana was too high? Was that the cause of it?

A. Yes, we tried to effect it to the Texarkana market also; we thought the sugar rate in here was too high, and naturally, we tried to effect the very arrangement that I suppose was afterwards effected by Mr. Hampton, after he came on the commission.

Q. Didn't you find the sugar rate operating very unequally in different parts of the state?

A. Yes, sir.

Q. And it was to correct that inequality, as well as to
2269 get a better rate, that you were anxious to effect that readjustment?

A. Yes, sir.

2270 J. D. WATSON, being recalled for the defendant, deposed as follows:

Direct examination.

By Mr. HILL:

Q. Have you, since I requested it, examined the various interstate tariffs that were promulgated by your road since the injunction became effective Nov. 2nd, 1908?

A. I have.

Q. Can you state generally what changes have been made in the interstate rates, since November 2nd, 1908?

A. The interstate rates to the State of Arkansas, as a whole, have been changed to the extent of eliminating the less than carload commodity rates, which were in effect within the state, prior to the date of the injunction.

Q. When was that made effective, the change that you are referring to?

A. From St. Louis to points in Arkansas, it was effective on our line February 1st, 1909.

Q. Was that the first change that was made in the interstate rates after Nov. 2nd, 1908?

A. It was the first change to local points, not the first change to common points.

Q. When did you make your first change to common points, after November 2nd?

A. Effective Nov. 29, 1908.

Q. That was the date of the changes to common points,
2271 was it?

A. Yes, sir. Now, that is not a general change; you asked for the first change.

Q. Was that a change of any considerable extent, I am speaking generally, of the volume of the traffic?

A. No.

Q. Was the change of February 1st of any general extent?

A. The first change of any general extent to common points was effective Dec. 30; the first change made to local points was effective on our line, Feby. 1st.

Q. Now, were there any other changes,—that is changes of moment—I do not want to go into any small details, up to June 1st, 1909?

A. To common points, yes; for local points, no.

Q. When was the change to common points after that, of any extent?

A. The changes were being made just as fast as the supplements could be issued, and there was a supplement issued every thirty days, starting in on Nov. 29th, 1908, and every thirty days up to that time, up to date, and they are still being made.

Q. That is the common practice at all times?

A. Yes, sir, the changes in this supplement are incident to changes in state adjustment, as they are found, and as they are checked; there are many thousands of these rates.

Q. Now, I wish you would approximate, if you can, the extent of the changes as affecting the volume of traffic, from Nov.
2272 2nd to June 1st, 1909? How much of the volume of the traffic was affected by these changes?

A. It would be impossible for me to give you a definite percentage of the volume, but I can say, in a general way, a large volume.

Q. You could not give any approximation?

A. No, it would be impossible; I might explain the reason why; I cannot give you that statement; the volume of traffic, less than carload, as compared with the carload tonnage, is a very hard factor to determine. The less than carloads are affected, and some carloads; the majority of the rates that were affected were less than carloads, to local points.

Q. Then, your changes of the rates from Nov. 2nd to June 1st, were principally of the L. C. L. rates?

A. Yes, sir.

Q. There was no material change, during that period, in the carload rates; that is, material as affecting the volume of your traffic?

A. I couldn't answer that without checking the record, to determine that definitely.

Q. After June 1st, for six months say, what was the extent of the changes in the interstate rates?

A. I believe that from June 1st, for the following six months, from June 1st, 1909, for the following six months, the changes were as much or more than for the preceding six months.

Q. Were the changes from June 1st, for the ensuing six
2273 months, reductions or increases, generally speaking?

A. The majority of them were increases.

Q. Were there any reductions of any moment, from June 1st, 1909 to January 1st, 1910?

A. I don't know what you mean by "any moment;" reductions were made where it was found that some error had been made in readjusting the rates to the new conditions.

Q. That would be of some detail; I mean anything that would materially affect the revenue of your road?

A. I don't believe so.

Q. Before the injunction became effective, was there an effort made to adjust the interstate rates to the proposed intrastate rates that were put out by the railroads?

A. The time was too short to accomplish the changes incident to the new adjustment, but an effort was made.

Q. Do you know Mr. E. K. Vorhees?

A. I do.

Q. What position does he occupy?

A. General Freight agent of the Frisco system.

Q. I want to read you a statement from an affidavit filed by him in this court, on motion to modify the injunction in this case:

"Affiant further states that he was directed and instructed to co-operate with the officials of other Arkansas railroads, and to discuss and consider with them in conference, a schedule of rates that should be operative within the State of Arkansas, in lieu
2274 of said Standard Freight Distance Tariff #3. Affiant states that early in September, 1908, he met representatives of every traffic department of other railroads operating in the state, in conference, and the said conference remained in session about fifteen days, and as a result, the representatives of each line recommended to his company the adoption of a schedule of changes to apply within the State of Arkansas, in place of said Standard Freight Distance Tariff #3. Affiant states that the chief traffic officials of the lines named, gave careful consideration to the schedule that was recommended, and that before any schedule was adopted and published by the several lines, conferences were held with a large number of Arkansas shippers who would be affected by the changes of rates, and also with the railroad commission of Arkansas; that all objections from all said shippers and receivers, or the railroad commission of Arkansas, were given due and proper consideration, and a number of modifications were made in the rates first recommended, before they were afterward made effective by the several railroads, on Nov. 2nd, 1908. Affiant states that the representatives of the several lines discuss- and considered the relations which should exist between the several class rates, and after much study and comparison with the rates in other states, and the class rates applying on inter-state traffic in various portions of the territory west of the
2275 Mississippi River, and other elements affecting the fixing of class rates; it was decided to recommend that the various

classes should bear the following relation to each other," and then it sets forth the tabulation, which I will omit:

"Affiant represents that this decision was reached only after full discussion by representatives of the several lines, and that such recommendation was adopted by the chief traffic officials of the several railroad companies only after careful consideration, and affiant says that the relation of class rates resulting from the application of this principle, is fair and reasonable and just, as applied to traffic within the State of Arkansas."

Were you present at this conference to which Mr. Vorhees is referring?

A. I was.

Q. Is this a correct statement of what took place in this conference?

A. Yes, without the detail.

Q. Did you, in this conference, consider the interstate rates as well as the intrastate rates, when you were fixing the tariff which became effective Nov. 2nd?

A. We did.

Q. Did you attempt to adjust the relation that should be obtained between the state and interstate rates, in this conference?

2276 A. We cerainly did.

Q. The interstate tariff which was issued by your company in November or December, attempted to reflect the interstate rates as readjusted to the state rates, which you made effective Nov. 2nd, wasn't it?

A. As far as was possible to do so, yes; it is impracticable to adjust rates with only one factor, that factor being the state rate; there are a great many other considerations that move the adjustment of interstate rates; the state rate is one of them.

Q. What are the other considerations?

A. Commercial conditions; the long and short haul, the competition; that is a few of them.

Q. Explain just what effect the long and short haul would have in this connection?

A. It would be rather difficult to establish a higher rate for a short haul than for a long haul; if you operate the short haul upon a lower rate than the long haul, or if the long haul point happens to be reached by the short haul road, making it a short haul by one line and a long haul by another line, that makes quite a difference.

Q. That brings the proposition back to short line competition?

A. No, it brings the proposition back to conditions which are governed by the situation or location of railroads, the point of origin and point of destination.

Q. There were no changes in the location of your railroads between Nov. 2nd and June 1st, were there?

2277 A. You have evidently misunderstood my answer.

Q. What do you mean by the "location?"

A. I can possibly best explain it to you by giving you the points of distinction; we are short haul probably from Memphis to Pine Bluff; the Iron Mountain is long haul; that is the two lines at Pine

Bluff. At Little Rock, we are the long haul; the Iron Mountain is next, and the Rock Island is shortest.

Q. And if there would be a still shorter line built——

A. The still shorter line would make the rate.

Q. If a still shorter line would be built, you would have to readjust your conditions to meet that shorter line?

A. Yes, sir.

Q. There was nothing of that kind requiring readjustment, from Nov. 1908 to June, 1909?

A. No, sir, there was nothing of that character.

Q. Did I understand your statement to be, that from Nov. 2nd to June 1st, the principal changes were in regard to the L. C. L. rates?

A. That, I believe, was my statement.

Q. You could not approximate the extent of the other changes, but think they were proportionately speaking, small, as I understand it?

A. As affecting rates, yes; of the volume of traffic, I could not say.

Q. Well, it is the revenue feature of it that I am inquiring about?

A. I understand.

2278 Q. Could you give me an estimate from your experience, as to the volume of traffic intrastate, which moves under the class rates,—that is, L. C. L. and carload both?

A. You mean under the Standard Freight Distance Tariff?

Q. Yes, take it under the Standard Freight Distance Tariff?

A. It was very small.

Q. The volume of traffic that moved under it was small?

A. Yes, under class rates.

Q. Under both carload and less?

A. Yes, for the reason that the object of the Standard Freight Distance Tariff appeared to be to establish commodity rates to cover all given commodities, carload and less.

Q. Could you approximate the proportion of the movement into the state, under the class rates, and under the commodity rates? Have you ever figured on it, or given it any thought?

A. No, sir; I have given it considerable thought and figured on it, but it was impossible to arrive at it, without getting figures from the accounting department, and it was too voluminous a task; I have never attempted to get the figures.

Q. It would be impossible then for you — make even an approximate estimate?

A. One that would be of any service to you, yes.

No cross-examination.

2279 R. E. KIMBALL, being first duly sworn and examined, deposed as follows, being recalled:

Redirect examination.

By Mr. HILL:

Q. I requested you, when you were last here, to make a calculation, assuming the 96.1% increase in state freight and 9.4 increase in interstate freight, had been effective during the last six months of 1907, per ton per mile, and to make a calculation upon the apportionment of the expense between state and interstate traffic, as shown in your exhibit, covering that period, so as to show the decreased amount apportioned to interstate traffic under the supposed increase, and the increased amount apportioned to state traffic, under the supposed increase. Have you made that calculation?

A. I have, yes, sir.

Q. Will you attach that as Exhibit "E" to your testimony?

A. Yes, sir.

For Exhibit "E," see Volume 9, page 5778.

Q. I see from examining Exhibit "E," that you have made your calculations upon the basis that you have made your exhibits in this case, and also as the increases are illustrated in Exhibit 23; that is correct, isn't it?

A. Yes, sir.

Q. I will now ask you to state the result of that calculation in dollars and cents, the increased expense apportioned to state traffic, as shown by Exhibit "E"?

2280 A. Under Exhibit "E," the assumed basis shows the state freight expense, arrived at on a straight revenue basis of $148,796.45, for the period, July to December, 1907, inclusive. The actual figures for that period, as shown by Exhibit 33 were $89227.28.

Q. Showing an increase of how many dollars?

A. $59,569.17.

Q. Now, showing in the same way the decreased amount apportioned to interstate?

A. Under Exhibit "E," which is the assumed basis, the expenses apportioned to interstate freight, is $766,310.87, and under Exhibit 33, the expense apportioned to interstate traffic, which is on an actual basis and straight revenue being used, $823,408.60; the difference being a decrease of $57,097.73.

Q. By the "actual," you mean the actual revenue shown by your Exhibit 33, that you earned without the increase assumed which I have put to you to work out this problem?

A. Yes, sir.

Q. It is in evidence, that after the two cent fare was enjoined, that there was an increase in the passenger rate to 3 cents in most instances, but averaging about 35% in the passenger rate, by the railroads; it has been shown that the rates applied by the Cotton Belt on freight traffic in January, 1909, show an increase over those

in effect during the last half of 1907, of 96.1% on the state and 9.4 on the interstate? Applying these increases to the traffic,
2281 both passenger and freight, for the six months ending December 31, 1907, and using the gross revenue so ascertained, to divide the actual operating expenses of that six months, and also dividing double the assessed valuation on the same basis of your property, I wish you would state what would be the return on your property on that assumed basis, on the state traffic, and to save you the trouble of making the calculation, I wil hand you a calculation and you can see if that is correctly made?

A. I would like to have a little time to figure it.

Q. In page 2 of Exhibit 3, filed by Mr. Johnson, it shows the return on double the assessed valuation of the Iron Mountain, resulting from the operations of that line the last six months of 1907, but your exhibit does not make a corresponding statement, and I want you to attach as an exhibit, a corresponding statement to that, and we have prepared that here; I will submit it to you for your examination; it is just bringing forward in this form, your own exhibit.

A. I will want a little time to figure that.

Further examination postponed.

2282 R. T. BROOK, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. What is your name, residence and occupation?

A. R. T. Brook, Miller, Little Rock, Ark.

Q. How long have you been engaged in the milling business?

A. I am a miller and grain man, and have been engaged in the grain business since 1898.

Q. Are you familiar with the grain elevators in this country, and their value, and grain elevators generally?

A. Yes, sir.

Q. It is a part of your business to be familiar with the values of them?

A. It is.

Q. Do you know the elevator situated in Little Rock, commonly known as the Bunch Elevator?

A. In Argenta?

Q. Yes.

A. I do, it is a mill and elevator.

Q. Do you know about its value?

A. The value today would be about $186,000, that is the mill, elevator and warehouse.

Q. Do you know about its value in 1907, say the last half
2283 of 1907?

A. It is about the same; I don't think there was very much difference in machinery at that time.

Q. Do you know whether that was a public elevator, during the last half of 1907?

A. It was a private elevator.

Q. I wish you would state your opinion of the rental value of that elevator property, taking the entire property?

A. The mill, elevator and warehouse rental value, reasonable rental value, would be about $20,000 a year.

Q. In 1907, what would it have been?

A. Same thing.

Cross-examination.

By Mr. MOORE:

Q. How long have you been engaged in business in Little Rock?

A. About four years and a half, since October 1st, 1905.

Q. And where did you do business before you came here?

A. Oklahoma.

Q. What was your business there?

A. Grain business, and interested in a mill; elevator business and mill business.

Q. Did you rent an elevator there?

A. No, I had one of my own.

Q. Did you ever rent one?

A. No, I didn't rent an elevator.

Q. Never rented one as lessor or lessee?

A. No, sir.

2284 Q. Have you any knowledge of the cost of the elevator in Argenta?

A. Only the cost which I acquired during a suit which I had against the Iron Mountain, the actual cost as shown in that suit; the cost of that elevator came out in that law suit.

Q. Was it as much as you have estimated the value here?

A. Pretty close to it; let's see; it was $106,821.76., and there were additions made since that time; a drier was put in, corn drier put in, amounting to about $50,000 odd dollars.

2285 C. W. LEWIS, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. I wish you would state your name, occupation and residence?

A. C. W. Lewis, I am in the lumber business, living at Benton, Ark.

Q. How long have you been engaged in the lumber business, Mr. Lewis?

A. About ten years.

Q. Are you familiar with the rates on lumber that prevail over this section of the country?

A. Yes, reasonably so, I could name quite a few of them.

Q. I don't mean the detail so much as I do the general system of rates? Are you familiar with the general system?

A. Reasonably so.

Q. I hand you two maps, representing the zones in which lumber originates, and in which it is shipped; they are exhibits 39 and 40 in this case; I ask you to examine them—you have already looked at them, and I will ask you if you are familiar with the system that is shown in those maps?

A. I think so, yes, sir.

Q. Is there an additional zone on the east side of the river?

A. There is a blanket rate applies over here on the east side of the river.

2286 Q. On the gulf coast?

A. Yes, sir.

Q. Mississippi?

A. Yes, sir, and part of Louisiana, on the east side of the Mississippi River.

Q. And directly east of the zone that is shown on that map?

A. Yes, sir.

Q. Now, where is that zone rate to?

A. St. Louis.

Q. How does it compare with the zone rate which embraces Arkansas?

A. 2 cents lower than the west side.

Q. Then, they haul the lumber from that zone——

A. In Louisiana and Mississippi.

Q. To St. Louis, lower than they do from Arkansas?

A. 2 cents lower, yes, sir; 16 cents over there and 18 over here.

Q. Where is the market for the lumber that is produced in Arkansas, pine and cypress, I am speaking of?

A. Largely in the northwest territory.

Q. You mean the territory here indicated on this exhibit 39?

A. Yes, sir, largely.

Q. Are there heavy shipments into that zone from Arkansas?

A. Yes, sir, the shipments from Arkansas go into that territory very heavy.

Q. That is not a paper rate, it is a real rate?

A. Yes, sir, and it goes over here into Illinois, Indiana, and Iowa.

2287 Q. That proceeds under this zone rate, that is indicated on exhibit 40?

A. Yes, sir, that territory is practically all 8 cents beyond St. Louis.

Q. It is first predicated on 18 cents to St. Louis?

A. Yes, sir, it goes clear through to Chicago on 8 cents beyond, 26 cents; that territory up there is practically all covered by one rate.

Q. The question I want to direct your attention to particularly, is this; does the lumber really move from Arkansas under these zone rates indicated on these maps, or are they partly paper tariffs?

A. Well, it largely moves on those rates; of course, there are a great many of the mills have a tap line road that throws it lower.

Q. We will get at that as another proposition; I am speaking of the actual movement from Arkansas.

A. They largely move on the tariffs, as far as I know, on the published tariffs of the companies.

Q. Into these zones?

A. Yes, sir.

Q. Those zones then, largely represent the market that is found for the Arkansas pine and cypress?

A. They represent quite a good deal of the territory into which it goes.

Q. I don't mean all of it; a large movement is represented by it?

A. Yes, sir, quite a lot of it goes into that territory.

2288 Q. Are there other zones in the neighborhood of these exhibits on these maps, that take the same rate or practically the same rate?

A. Yes, sir; of course, the Oklahoma rate is not so much of a blanket rate as the other; Illinois, Iowa and Indiana take pretty nearly the same rate, little difference in it, doesn't amount to very much.

Q. Now, you referred to the tap lines; I wish you would explain how the lumber is handled over the tap lines, and what you mean by tap lines?

A. We don't own any tap lines; we don't own any railroad, but the tariffs show a differential for the smaller roads throughout Arkansas, that give them a part of their haul, running from 3 to 6 or 9 cents difference.

Q. That is, a small part of this 18 cent rate or 23 cent rate, is divided with this small line?

A. As I understand it, yes; I am not very familiar with that business; we don't own a railroad.

Q. Well, you may not be familiar with the detail; you know that is done?

A. Yes, sir.

Q. To illustrate that, suppose that a large sawmill had a road five or ten or fifteen miles long, and it shipped lumber, or logs first into its mill, and then the lumber on into St. Louis, how would that be divided?

A. It takes the same rate from the end of their road that it would from the main line, and then they are allowed a differential, whatever their arrangement is with the railroad; the differential

2289 runs, as I understand it, all the way from two to six cents.

Q. That is more a division of the rate than it is a differential, isn't it?

A. They have called it most anything.

Q. There is no increase in the rate, by reason of its being divided with the tap line?

A. No, it is the same rate; they have called it differentials, and rebates, and everything; I don't think anybody knows just what it is.

Q. Now, what we are particularly trying to find out in this case, is the cost of service and the revenue producing the rate; I want to know what would be the difference in cost, say that a shipment originated in the woods on some tap line, and was carried to St. Louis at 18 cents, and another shipment originated at your mill, and you say you have no tap line—that goes into St. Louis, and suppose the tap line joined the main line just where your mill is, what difference would there be to the Iron Mountain Railroad, if you were on that road, in hauling two cars of lumber, one from your mill and one from the other mill?

A. I don't think there would be any difference in the cost of transportation, so far as the Iron Mountain is concerned.

Q. What would be the difference in revenue?

A. For the Iron Mountain you mean?

Q. Yes, sir.

A. The difference in revenue would be whatever they would pay a tap line, whatever it might be; those tap line divisions
2290 don't all run the same; some fellows are able to squeeze more out of them than the others are.

Q. There is a variation on the revenue of the amount paid to the tap line?

A. Yes, sir.

Q. Does this division principle also apply to different railroads; suppose that lumber was shipped into Alexandria on the Iron Mountain from some other road——

A. They publish a through tariff and divide it up; yes, the same rate is applied, the same as in going over three or four railroads.

Q. And suppose that there would be two cars of lumber shipped via the Iron Mountain from Alexandria to St. Louis, and they would get the 18 cent rate, as I understand it; one of those cars originated at Alexandria, and was delivered to it there; the other originated at some other point on some other railroad, and was delivered to it at Alexandria, and those two cars were hauled to St. Louis together: as far as you can say, would there be any difference in the cost of service in hauling those two cars?

A. No, sir.

Q. Would there be any difference in revenue?

A. Of course, if the Iron Mountain started the shipment and carried it all the way, there wouldn't have to be any division, they wouldn't have to divide it with anybody else.

Q. That is the illustration I gave you of one car, and the other car they would divide that with the road that brought it in?

2291 A. Yes, sir, the one they hauled on their own line all the way, they wouldn't have to divide.

Q. Is there much lumber shipped that way on divisions?

A. Practically all the big mills, they get a division, as far as Arkansas is concerned; practically all the big mills have short lines of railroad, that is owned and operated by the same people, but of course, it is a separate corporation and the saw mill does not get any rebate, but the railroad gets the division.

Q. And the lumber that is furnished by the small mills and

not furnished by other railroads, produces a greater revenue to the Iron Mountain, or whatever the particular carrier is, to the final destination, than those shipments that originate on the tap lines and the other roads?

A. Yes, sir.

Q. Now, in shipping lumber from Louisiana territory into Little Rock, what would be the rate?

A. My recollection of that rate, I would not like to be absolutely sure about that, but my recollection of the rate is, it is 22 cents into Little Rock.

Q. Then a car of lumber originating down in Louisiana—say two cars originating in Louisiana, one destined to St. Louis and one destined to Little Rock, hauled in the same train, they would get 22 cents for the one to Little Rock, and the other car, they would carry it to Little Rock, and detach it from the other car and carry it to St. Louis for 18 cents; is that the situation?

2292 A. Yes, sir, that rate as I understand it, is in there for the purpose of protecting the territory near to Little Rock; Louisiana cannot very well sell any stuff in this territory, on account of her rates; she can go to St. Louis as well as the rest of us.

Q. How about protecting the revenue?

A. I don't know about that end of it.

Cross-examination.

By Mr. MOORE:

Q. What is the reason for the establishment of zone rates on lumber from Arkansas territory into these northwestern points?

A. Well, I really don't know that I know just what the reason is.

Q. It is in pursuance of some policy?

A. I suppose, I judge you would call it a policy of the railroad; I know no better name for it; it is a blanket rate covering certain territory.

Q. Do you know what causes railroads to give those blanket rates?

A. I could hardly say that I know just what causes it.

Q. What is your understanding about it?

A. My understanding of the matter is that those rates were put in—in fact, I think that is the way—that those rates were put in when railroads first built in here; it opened up new territory, and it was figured out on some sort of a basis, to get stuff to market, and they just simply figured about what the commodity would

2293 stand and took their wad, so that the other fellow could just about break even.

Q. What do you mean by that, "about what it would stand"?

A. For instance, four years ago, when the price of lumber was up, they raised the rate; the commodity and rate runs about together; the manufacturer gets about as much as the railroad does.

Q. Isn't one reason for that adjustment, that it enables the manufacturer to do business?

A. Yes, possibly, that evidently has something to do with it; if

the rates were all the same, and all things being equal, of course, it would put the manufacturer on an equal footing——

Q. Isn't that one of the objects of it?

A. I presume so.

Q. What would be the effect of putting rates on a mileage scale, and charging according to the distances on the lumber industry in this state?

A. Of Arkansas?

Q. Yes.

A. It would help Arkansas.

Q. What effect would it have on territory south of Arkansas?

A. Really, I don't know; it strikes me it would not hurt that seriously, because they could get it down to the gulf and export it.

Q. How are those zones to the northwest situated, with reference to other lumber producing territory; is there any other
2294 lumber producing territory that can serve those markets in these zones than the Arkansas, Texas and Louisiana territory?

A. No, not unless they went west.

Q. What territory is there west?

A. They would have to go west of the Rocky Mountains, and that is a long freight haul, too.

Q. If the railroad would apply mileage scale rates, what effect would it have on the carrying business of the different lines of road in this state, say the Iron Mountain road and Chicago, Rock Island & Pacific Railroad; which of those two lines has the shorter haul to St. Louis for lumber?

A. Without looking it up closely, I would say the Iron Mountain has.

Q. What effect would the mileage scale have upon the ability of the Rock Island road to deliver lumber in St. Louis, if that is the case.

A. It might make the rate a little bit higher from Rock Island points; if it was figured on an exact mileage basis.

Q. That would be prohibitory, wouldn't it, for business on the Rock Island, if the rates were higher?

A. I don't know; not necessarily; they don't maintain the same rate now; the Rock Island, in some instances, gives two cents, where the Iron Mountain gives four or five to the tap line.

Q. Give me some instances in which you say there is a
2295 larger amount given by the Iron Mountain than the Rock Island?

A. This Fourche River & Indian Territory Railroad up here, that taps the Rock Island at Bigelow, according to the testimony of one of their men in court a few days ago, runs from 2 cents to Memphis, to two to Cairo, I believe, 3 to St. Louis, four to Kansas City, and 4½ to Oklahoma points west.

Q. You mean that is the division given the tap line?

A. That is the way I remember it.

Q. What tap line is that?

A. That is the Fourche River & Indian Territory?

Q. What is the length of that tap line?
A. I suppose they have 20 miles.
Q. Now, give me an instance on the Iron Mountain on all fours with it?
A. I haven't the evidences strong on that, but I am informed that the Grayson-McLeod road, St. Louis Southwstern,—what is the name of their tap line road they had down there——

Mr. HILL:

Q. Arkansas Southwestern?
A. Yes, sir, it is a part of the Iron Mountain now, but a few years ago, Mr. Grayson told me they were getting four cents.

Mr. MOORE:

Q. I want to compare the two at the same time.
A. The fact about it is I haven't got those rates.
Q. If you haven't got the rates on both lines themselves, you can't really testify about that, can you?
2296 A. I am only testifying as I understand them, and have picked it up; I am not absolutely positive about it.
Q. Your understanding on the old Grayson road, it was owned by a different interest from the Iron Mountain several years ago?
A. Yes, sir.
Q. What was the length of that line?
A. At that time, about 12 or 15 miles, it is longer now.
Q. What is the most direct and shortest road from this territory to the Kansas City market?
A. I really don't know.
Q. Which is the more direct, the Iron Mountain or the Rock Island?
A. I really don't know; one reason we never paid much attention to the direct road in shipping the stuff, was because they had the same rate both ways, I really couldn't tell you just exactly about those rates because I have never thought about them very seriously. It was a flat rate, and it never made much difference, if they carried it clear around the world, just so they got it there.
Q. It is a fact, isn't it, among competing railroads, the one that has the shortest line, if the rate is based on a mileage scale, can oust its competitors?
A. That would depend somewhat on the supply of the commodity.
Q. Assuming there is a supply.
A. Assuming that each had the same chance at the commodity?
Q. Of course, I assume that.
2297 A. That would be true, yes.
Q. But for this blanket arrangement that would be true as to the roads that hauled lumber out of Arkansas to the northeastern markets?
A. That might be true.
Q. Have you ever made any complaint that these rates were too low?

A. No, sir, never have.
Q. Do you think they are too low?
A. Which rates do you mean?
Q. The lumber rates in these zones?
A. You mean to St. Louis?
Q. Yes?
A. No, sir, I never complained about them being too low; I grumbled about them being too high.
Q. Do you think they are too low?
A. I think they are too low for the other part of the territory at least.
Q. I mean with reference to the services rendered by the railroad in transporting them, do you think they have put them too low so they cannot make anything on them?
A. No, I don't think they would put them where they couldn't make any money.
Q. I want to ask you a little more about these tap lines, describe to me just what they are, what is the arrangement of the tap lines?
A. Since we never did own one, I don't know whether I could be very minute in my descriptions of those things or not. It is
2298 only in a general way I know anything about them.
Q. What is the length of those tap lines?
A. They are supposed to be roads originating the product; that is, they go out and those tap lines run out into the timber and bring in logs; sometimes, the mill is located on the road; sometimes at the junction; the tariff is made to cover everything that goes off of that road; it goes from the junction point; supposed to be just what goes off the road; in fact, it is everything that the sawmill can buy; it is only supposed to be everything that originates on the road; everything they ship is billed off the tap line; if they could get a differential, they would be very foolish not to take it.
Q. Tell me the length of those lines?
A. They vary anywhere from five to twenty-five of forty miles; the Fourche River Railroad is chartered for forty miles; they built about twenty-five.
Q. What is the length of the Arkansas Southwestern?
A. It is quite a road now; it goes away out into Montgomery County, must be fifty or sixty miles.
Q. What service do those tap lines render to the main lines?
A. They really originate the stuff; they get the timber, the lumber.
Q. And haul it to the junction points?
A. Yes, sir.
Q. Who owns the line?
A. Usually they have a corporation that owns them; they are owned by the railroad corporation.
2299 Q. They are owned by different individuals from the main line?
A. Yes, sir, usually the same people who own the saw mills.
Q. They are usually incorporated railroad companies?
A. Yes, sir.

Q. Operating in that line of business?

A. Yes, sir.

Q. And they originate this freight and carry it to the junction point on their own rate?

A. Yes, sir.

Q. What other service do they render besides simply transporting it; do they load it on the car?

A. The railroad does not load anything; the sawmill loads it, of course, but they all do that; the sawmill on the main line loads the same as the other.

Q. The same rule is practiced as is practiced generally, the owner of the product loads it on the cars?

A. Yes, sir.

Q. And these tap lines haul the cars out to the point where it originates?

A. Yes, sir, hauls the cars to the timber, and hauls the timber into the mills.

Q. Probably hauls the empty cars out there to get the lumber?

A. Yes, sir.

Q. They have a double haul, a haul going and a haul coming back?

A. Yes, sir, they usually run a bunch of log cars.

2300 Q. Now, if the railroad company sent their cars out to these points where the lumber originated, they would have to send them out empty to get the load and bring them out to the junction?

A. It is all the same whether the car goes ten miles further or stops at the junction.

Q. I want to get at the fact, whether the railroads, if they sent out their cars to the point where the material originates, would they have to send them out empty in order to get them returned loaded?

A. It would not be practical to send regular railroad cars out to the logs, if it was a proposition where they hauled logs.

Q. Take a proposition where they haul lumber?

A. Then it would be all the same, if it was on the main line.

Q. I mean a tap line which is 25 or 30 or 40 miles off the main line?

A. If a mill was located out on the tap line, why of course they would have to have some way to get the cars out to the junction.

Q. What I want to get at is this: there is a real service rendered by these tap line railroads, in transporting this product along the railroad from its origin to the destination of shipment?

A. There is supposed to be at least, and there is in the greater portion of them.

Q. It is just a matter of division of the rate, in consideration of the services they render?

2301 A. So far as the railroad is concerned, yes.

Q. Do you know really—I am not asking now if you have information or knowledge, upon which the basis of the division is made, for tap lines, what they get for their services?

A. No, sir, my understanding is they don't earn some.

Q. Is that simply an impression you have or do you know that from your own knowledge?

A. It is largely gathered from the testimony of railroad mill operators in different suits where they have been in court.

Q. It is second-hand information?

A. Yes, sir.

Q. Now, there might be a difference, based on the difference surrounding the service, might there not?

A. Sure.

Q. You don't know to what extent the differences in character of services rendered, and differences that affect the service or that can affect it, what effect that has on the basis of the division?

A. No, sir, those things, so far as I know, are arranged between the different freight agents of the railroads and the operators.

Q. You found in your experience, that they are disposed to give the shipper too large a proportion of the rate, in case they divide with him?

A. Well, take the mill located right at the junction, and every cent that he gets is that much over the fellow that doesn't
2302 own the railroad.

Q. If he is right at the junction, what services does he render?

A. Nothing in the world; he brings his logs in on the railroad and the rest of us bring them in on the dirt road.

Q. However, doing that the railroad makes him some allowance for that?

A. Yes, sir, they pay a differential.

Q. Do you know what the regulations of the Arkansas State Commission are, in regard to the transportation of logs to the milling points to be milled and put in condition to ship to the market, do you know what the regulation is in regard to rates prescribed by the state commission?

A. In moving logs?

Q. Rough material?

A. Yes, I know some of their rough material rates.

Q. What are they?

A. They are based largely on the mileage basis.

Q. What cases do they apply to, in connection with the shipment?

A. The only requirement is to make a point with the railroad company that they will ship it out again.

Q. What is the rate prescribed in cases like that?

A. It runs from two to six or eight cents; I don't remember just how high it does run.

Q. There is, under the regulations of the state railroad commission, a rule prescribed of compensation for hauling the rough material to the mill where it is shipped out by the line of
2303 some other carriers?

A. Yes, there is a rule that is used somewhat, but it does not amount to anything much, except to the factories, furniture factories.

Q. There is a regulation of that sort?

A. Yes, sir.

Q. Who do those rough material rates apply to; what class of shipment, or rather, what class of material do they apply to?

A. That is rough material, rough lumber.

Q. Does it apply to furniture, rough lumber that is manufactured into furniture?

A. The Rock Island, I believe does—the Iron Mountain——

Q. I am talking about the regulations prescribed by the state commission?

A. We had a wrangle awhile back about it, and they cut out a part of that, but I think it has gone back again; I know the screen door manufacturer gets it.

Q. Do you know whether it has been the subject of investigation by the Interstate Commerce Commission or not?

A. Yes.

Q. Do you know what ruling they made?

A. The papers are full of it all the time.

Q. Do you know what ruling the Interstate Commerce Commission made in regard to it?

A. I couldn't tell you just now.

Q. Wasn't there some complaint before the Interstate Commerce Commission, relative to rates east and west of the Mississippi River on lumber?

2304 A. Yes, sir, they raised it east of the river, and they forced it down again.

Q. Were you a party to that proceeding?

A. No, sir, we have always been west of the river; my understanding is there is no tap lines allowances on the east side of the river at all.

Q. Perhaps I didn't make my question clear; I understand that there were two cases growing out of the complaints made in one instance by shippers east of the river, and in one instance by shippers west of the river; were you a party to either of those proceedings?

A. No, sir.

Q. Do you know whether the Interstate Commerce Commission made a reduction in rates east of the Mississippi River?

A. Yes, the rate was reduced.

Q. Wasn't it done because the tap line arrangement did not exist there?

A. Yes, sir, and my idea about the one that started on the west side was that it never was pushed in a very clean cut manner; the trouble about it is, all the big fellows on this side of the river cannot afford to push it, and the little fellows haven't the money.

Q. The fact is, they made the reduction east of the river and didn't west?

A. Yes, sir.

Q. And this tap line service and the division of the rates, west of the river, figured in that controversy?

2305 A. Yes, sir; I understand there is no tap line east of the river; I think may be there is one; one road is allowed a division, and it is a pretty good railroad.

Q. Now, you testified about the rates that were allowed, the compensation allowed to tap lines, and I think you said they got from four to nine cents?

A. I don't know just what that difference is; it runs, as I have been informed, some people told me that they got as high as seven, eight or nine cents.

Q. Who did you get that information from, what tap line was it that got seven or eight or nine cents?

A. Really, I don't like to give the gentleman away; he may have been giving me hot air; I don't care to get him in the controversy.

Q. All you know is possibly some hot air handed out to you?

A. I know what Mr. Morrison swore over here in court a few days ago, and I know what the Manager of the Fourche River road swore; I mean practically what they swore.

Q. Really do you know of any instance in which tap lines received a division of nine cents?

A. No, sir, I don't know of any positive division of nine cents.

Q. Do you know of any case where they received 8 cents?

A. You mean do I know positively if they got it?

Q. Yes?

A. No, I don't know positively.

Q. Do you know of any instance where they got six or
2306 seven cents?

A. No, sir, I don't know positively; I don't own a tap line, and I don't know that they receive anything.

Q. Your testimony is all hearsay?

A. Yes, largely necessarily so, on the tap line proposition, because I don't own one.

Q. What lines haul the principal part of the lumber from Louisiana points to Little Rock?

A. Really I don't know, I am not very familiar with the shipments from Louisiana to Little Rock.

Q. You stated if I understood you correctly, that the rate from Louisiana points to Little Rock is 22 cents?

A. That is my understanding.

Q. Do you understand that is the rate on the Iron Mountain?

A. Yes, that is the way it was given out to me.

Q. How did you get that information?

A. I got that information over in a hearing before the state railroad commission, and Mr. Watson, I think it was, was on the stand, and we were having a little tilt about raising the rates in Arkansas, and the Commission was inquiring as to what effect it would have on lumber in Arkansas, and I suggested it might let Louisiana into Little Rock on as low a rate as anybody, and I think Mr. Watson or somebody from the Cotton Belt, said the rate into Little Rock was 22 cents.

Q. Is this the gentleman?

A. Yes, sir, I think so; that is my information; I never looked it up.

Q. You really don't know what the rate on the Iron Moun-
2307 tain is?

A. Except what I have given you.

Q. Did he tell you what the rate on the Cotton Belt was?

A. He just said the rate from Louisiana to Little Rock was 22 cents; he was just showing us very clearly we would not get hurt by raising the rates.

Q. Who wanted the rates into Little Rock or Arkansas from Louisiana to be raised?

A. Nobody cared about that; it came in incidentally.

Q. In what way would that affect the lumber business in Arkansas, the rate from Louisiana?

A. If it was low enough, and they could ship cheaper than we could, it would help out.

Q. In other words, you apprehended a rate might be made that would enable the people in that territory to compete with lumber in this territory?

A. Yes; the distance in lumber rates doesn't cut but very little figure, when they go to making them.

Q. Why doesn't it?

A. They go to Chicago for 26 cents.

Q. Doesn't that fact that I referred to a moment ago, the giving of a very low rate from Louisiana in to this territory, wouldn't that interefere with the business of the manufacturers in this territory, doesn't that show and illustrate the necessity for these zone or blanket rates, in order to protect the different producing and purchasing territories.

A. Of course, it is very clearly illustrated what effect it has;
in the first place, the land values in that Southern territory
2308 are higher than they are in this country; timber land in that country is worth easy twice what it is here.

Q. In what way does that affect this country?

A. It would be the same proposition over again; it would still raise their timber land higher if they had lower rates; the cheaper they could sell the stuff, the more the stuff is worth.

Q. In other words, the cost of material is what causes the value of the lands to increase; as that increases, they are able to pay higher rates; is that true?

A. In other words, as the rate goes down, the stumpage goes up.

Q. Is there any difference in the amount of timber to the acre there is in that section, compared to this?

A. Yes, their timber is generally speaking, better—more timber on the ground.

Q. Their land is more heavily timbered?

A. Yes, sir, it lays betters; it is easier to put a road in.

Q. That is not a very material question there, but the point I want to get at is whether this system that you have called attention to, in testifying from the map, is not necessary and grows out of the conditions of that traffic?

A. I don't feel like it is; it may be.

Q. You think it would be better for the territories that produce

and the territories that buy, and for the shipper, and the carrier that there should be a mileage scale?

2309 A. I think so, decidedly so.

Q. Let's see why you think so; how far are you from St. Louis?

A. 375 miles, something like that.

Q. How far are most of your competitors south and west of you from that market?

A. After you get way down south, as you get to the gulf——

Q. South Arkansas, I mean?

A. It would only be a short distance further.

Q. It is a little further?

A. Yes, sir.

Q. If you put it on a mileage scale, it would make a difference of increasing the rate?

A. Yes, sir.

Q. The man closest to the market would think the mileage scale best?

A. Yes, sir.

Q The man a little further away wouldn't think so much of it?

A. Yes, sir, but Arkansas points happen to be up on that side.

Q. Aren't you a little closer to St. Louis market than most of your competitors?

A. Yes, possibly, not many of them; a few, yes.

Q. Can you recall,—just give us the names of any that are closer than you, except those in your immediate vicinity?

2310 A. No, none closer to amount to anything, I don't know of any closer; there wouldn't be much difference though in several of them.

Redirect examination.

By Mr. HILL:

Q. Mr. Moore was asking you about the rough material rate, and at the same time asking you about this tap line division; is there any relation or connection between those two propositions?

A. No, sir, they wouldn't have any use for a rough material rate?

Q. They don't need that in their business?

A. No, sir.

2311 A. C. READ, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HARROD:

Q. What is your name?

A. A. C. Read.

Q. What is your business?

A. I am with the Southern Trust Co., in the Real Estate Department.

Q. I will ask you if your experience in the real estate business, qualifies you to pass upon the value of rentals in this City?

A. Yes, I think it does.

Q. Are you acquainted with the hotel, known as the Pratt Hotel and the property therewith connected, such as the lunch room and hotel?

A. That was the old hotel?

Q. Yes?

A. Yes, sir.

Q. In 1907?

A. Three years ago.

Q. I would like for you to state, what in your judgment, is the fair rental value by the month or year for that property, including the hotel, bar room, lunch counter, and news stand, therewith connected?

A. How many rooms were there in the hotel?

2312 Q. I don't know exactly.

A. Around down here, with hotels of that character, we average them along at about $5. a room.

Q. Per month?

A. Yes, sir.

Q. What would you think the bar room privilege would be worth?

A. Our idea has been that was one of the best paying bar rooms in the city of Little Rock; about the highest priced rental of any bar room in this city, would be about $250.

Q. What would you think that would be worth per month?

A. $250.

Q. And the hotel would be worth $5. a room, at least?

A. Yes, sir.

Q. What do you think that the lunch stand and newspaper stand would be worth?

A. I don't know; we generally rent those to the highest bidder, or one we can get for them, but I should think easily $50. a month, for the lunch stand and the news stand; now, there are some news stands paying $50. and $75. a month up town here.

Q. You would think the news stand and lunch counter would be worth $50.00, and the bar room $250., and the hotel $5. per room?

A. Yes, sir.

Q. What do you think about the number of rooms in the hotel?

A. I don't know; I have been in there and slept there several nights, but I don't know how many rooms there are.

2313 Cross-examination.

By Mr. MOORE:

Q. Did you do your drinking at that bar?

A. No, sir.

2314 A. R. BRAGG, being recalled, deposed as follows:

Recross-examination.

By Mr. MOORE:

Q. You told me you would look up the matter as to whether the rates at certain points in northern Texas, among them Marshall and Jefferson and Waskon and Atlanta come under the Texarkana combination in rates? Interstate rates.

A. I found by taking the Texarkana proper tariff and adding the Texas Commission tariff, adding them on some commodities, it was a combination of the two rates.

Q. The two rates referred to are rates to Texarkana plus the local from Texarkana?

A. Yes, sir, plus the Texas Commission rates.

Q. Those places you me-n were the basing points for similar rates to other points?

A. Yes, sir, there were smaller points taking the same rates,—intermediate points.

Redirect examination.

By Mr. HILL:

Q. How many points were there?

A. There were only about four immediate points; that was Atlanta, Marshall, Jefferson and Waskon; the nearest point to Texarkana was 24 miles, and the furtherest was about 70.

Q. The statement was made by you in answer to some question the other day, that some of the voluntary interstate rates of the railroad to Arkansas points, were lower than the Commission tariff,
2315 and lower than the court tariff; have you looked up any of those rates since that time?

A. I have.

Q. Where did you find those?

A. I had knowledge of those conditions before, but I made some figures, on the White River Branch of the St. Louis, Iron Mountain and Southern.

Q. Have you those?

A. Yes, sir.

Q. I wish you would attach that to your deposition as Exhibit "F."

A. Yes, sir.

For Exhibit "F," see Volume 9, page 5781.

Q. Those are prevailing rates are they?

A. They are rates in effect now.

Q. Do you know of any other point where that same condition prevails?

A. Yes, sir.

Q. What other points?

A. That condition prevails on southern lines in the vicinity of Dermott and Varner.

Q. Southern part of the state?
A. Yes, sir.

And further deponent saith not.

2316 W. E. FLOYD, recalled, deposed as follows:

Direct examination.

By Mr. HILL:

Q. You are secretary of the Railroad Commission?
A. Yes, sir.
Q. Pursuant to an agreement entered into between the Railroad Commission and several of the railroads of the State, have any of the railroads filed monthly reports of the business under the court tariff, showing an increase of revenue by the court tariff, over Standard Distance Tariff #3?
A. Yes, sir.
Q. Have you any reports of the Chicago, Rock Island & Pacific?
A. Yes, sir, I have reports of the Rock Island road for four months.
Q. When was that filed?
A. On April 26th, 1910.
Q. I will ask you to read into the record the increases that are shown by those reports?
A. For the month of June, 1909, the report showed an increase of 19.59% of revenue received under the court tariff over what would have been the similar revenue under Standard Freight Distance Tariff #3, had it been in force and applied to the traffic moving. The report for the month of July, 1909, showed an increase of 21%, applied as above stated. The report for August,
2317 1909, showed an increase of 22.06% as above stated. The report for September, 1909, showed an increase of 21.32 as above stated, making an aggregate increase for the four months' period of 21.09% of revenue received under the court tariff, above what would have been received had the rates prescribed in Standard Distance Tariff #3 been applied for the traffic moving during those four months.

2318 J. W. CROCKETT, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. Please state your name, residence and present official position?
A. Little Rock; John W. Crockett; I am at present, a member of the Arkansas Railroad Commission.
Q. When did you become a member of the Arkansas Railroad Commission?
A. In January, 1907; I don't remember the date; I was sworn in sometime in January, 1907.

Q. Since you have been a member of the Arkansas Railroad Commission, have any of the trunk lines operating in the State, asked of the commission an increase in revenue?

A. No, sir.

Q. Either in whole or in part?

A. No, sir.

Q. Have they asked the Commission to raise any of their freight rates?

A. No, sir, I don't recall any.

Q. Have any of the small lines asked relief of the Commission in rates?

A. Yes, sir, the Little Rock, Hot Springs and Western asked the commission to permit them to restore some of the old rates which they had, which was an increase.

Q. Was it done?

2319 A. Yes, sir.

Q. Any other short lines applied to the commission for an increase?

A. I don't recall now judge, possibly so.

Q. Didn't the Missouri & North Arkansas?

A. Yes, they did.

Q. And the L. & A., didn't they ask for an increase?

A. I don't remember now.

Q. Since you have been a member of the Commission, if the railroads had applied to the Commission and showed you that the intrastate rates in force were non-compensatory, would you, as a member of the commission, and in your judgment would your associates on the commission have been willing to grant an increase of rates?

Question objected to by the plaintiffs.

A. Yes, sir, had they come to me or come to the commission, I would, and I am sure the other members of the commission would have permitted them to put in higher rates, if they had convinced us that the rate was too low.

2320 J. D. WATSON, being recalled, deposed as follows:

Direct examination.

By Mr. HILL:

Q. Are you familiar with coal rates from Illinois fields to Arkansas and Louisiana?

A. Reasonably so.

Q. I will ask you if you can give the rates over the Missouri Pacific under the joint tariff, from the Illinois field to Little Rock?

A. My recollection is $2.25 per ton. Yes, it is $2.25.

Q. What would it be from the Illinois field to Grady, Ark.?

A. $2.25.

Q. How far is Grady from Little Rock?

A. It is on the Little Rock, Mississippi & Texas Division, south of Little Rock.

Q. Something like forty or fifty miles?
A. I should judge more than that.
Q. Take Monroe, La., what is the rate from Illinois field to there?
A. $2. per ton.
Q. As against $2.25 for Little Rock?
A. Yes.
Q. What is it to Tullaloola, La.?
A. Also $2.
Q. What is it to Vidalia, La.?
A. $1.60.
Q. What is it to Rayville?
A. $2.25.
2321 Q. Same as Little Rock?
A. Yes.
Q. All of those shipments for Louisiana would pass through Arkansas would they not?
A. Through Arkansas but not through Little Rock.
Q. They would take the river division down?
A. Yes.
Q. Could you give me about the distance from Illinois field to those fields furtherest south into Louisiana, that I have given you?
A. The tariff would not give it, and I would not be able to give it without an examination of some mileage table.
Q. Give an approximation of it.
A. I should say it was five hundred some odd miles.
Q. How much further from the Illinois field than Little Rock would be?
A. Probably 150 to 200 miles.
Q. Are you familiar with rates from the territory north and east of St. Louis to Arkansas common points?
A. Reasonably so.
Q. How are those rates made?
A. There is a differential over the rates from St. Louis to Arkansas points.
Q. In dividing the rates made by this differential as you call it, there is a proportion of the rate going to the line that brings it to St. Louis, greater than the differential added to the St. Louis rate, to make the through rate?
A. Equal to or greater.
Q. Usually greater, isn't it?
2322 A. Yes.
Q. That would make the revenue of the Iron Mountain or of your road less on shipments derived from those carriers, bringing it in, in that way, than if the commodity originated in St. Louis, wouldn't it?
A. Yes.
Q. Could you give me the through rate and the division of the rate on a shipment of St. Louis beer, I think you have beer in St. Louis, originate some there, and also, some in Milwaukee, and that beer is consumed in Arkansas, some of it, strange to say.
A. I couldn't give you the figures off-hand.
Q. Could you look that up and give me the division on that; I

want a shipment of a carload from St. Louis to Little Rock or some other Arkansas point, and a shipment of beer from Milwaukee say, giving the divisions, assuming that the beer passed through St. Louis, and was handled as the St. Louis beer was down here, and showing the revenue which the Iron Mountain or your road derived from the shipment?

A. The fact that it passes through St. Louis has no effect on the rate; the rate adjustment is governed by an entirely different factor.

Q. I just want to make the illustration, have you the division sheet here?

A. No, but I can get them.

Q. You may make the illustration from some point, on packing house products, say from Chicago, to Little Rock, and a simi-
2323 lar shipment of packing house products, from St. Louis to Little Rock, showing the revenue derived by the road handling from St. Louis to Little Rock, and take farm wagons from Moline, Illinois, and compare that with shipments of other agricultural implements from St. Louis to Little Rock; I mean, a like shipment of wagons; if you don't find wagons, any other commodities of that class.

A. You mean in carloads?

Q. Yes; do you know how the first class rate from Chicago to Little Rock is made, and how it is divided?

A. By what junction?

Q. St. Louis?

A. We would not handle Chicago business via St. Louis; via East St. Louis the rate from Chicago is $1, with a differential of 20 cents, and the division of that through East St. Louis, the line to East St. Louis receives 65% of 40 cents; that is my recollection of the figures.

Q. You are familiar with rates from St. Louis to Little Rock and Alexandria and New Orleans, are you not?

A. Yes, sir, reasonably so.

Q. What is the rate on shoes and dry goods from St. Louis to Little Rock?

A. $1 per hundred pounds.

Q. What would it be to Alexandria, La.?

A. $1.25.

Q. What is the rate from St. Louis to New Orleans, on the
2324 same thing?

A. My recollection is it is 60 cents, I am not sure.

Q. 90 I think.

A. 90 cents, is right.

Q. How much further is it from St. Louis to New Orleans than it is from St. Louis to Little Rock?

A. I should say twice as far.

Q. The cost of service seems to be a little less from St. Louis to New Orleans than it is to Little Rock?

A. There are entirely different conditions governing there.

Q. It is not the cost of service that governs?

A. Not altogether.
Q. It doesn't seem to be a very large part of it.

Mr. MOORE:

Q. The Mississippi River has something to do with it?
A. Considerable to do with it.

Mr. HILL:

Q. Here is packing house products, carload; what is that to Little Rock?
A. I think it is 23 or 26 cents; the rate today is 31 cents.
Q. What is it to Alexandria from St. Louis?
A. 44 cents.
Q. And to New Orleans from St. Louis?
A. 30 cents.
Q. Are you sure of that; Mr. Hamilton had it 23 cents.
A. He used Helena figures, which I came very near using.
Q. A shipment of Packing house products to Little Rock would be 31 cents; to Alexandria, it would be 44 cents; to New
2325 Orleans, it is 30 cents?
A. Yes.
Q. That shipment going through to New Orleans would pass through Alexandria, wouldn't it?
A. I don't think so, under present conditions.
Q. How would it go?
A. By Ferriday, I think.
Q. Be any difference in the haul?
A. No, sir, not much.
Q. Wouldn't amount to very much more, if it went one way or the other?
A. Well, considerable.
Q. Forty or fifty miles?
A. More than that I should say.
Q. Some of the traffic gentlemen have used the pianos as an illustration of many points; I wish you would give me the piano rate from St. Louis to Little Rock; Pianos from St. Louis to Little Rock.
A. Pianos from St. Louis to Little Rock, carload, 65 cents.
Q. Isn't that 85, Mr. Watson?
A. No, 65 is right.
Q. Which class would it take?
A. It would take 2nd class.
Q. It has a commodity rating?
A. Yes, sir, 65 cents to Little Rock.
Q. Give us the commodity rate to New Orleans?
A. 75 to New Orleans.
Q. 65 to Little Rock?
A. Yes, sir.
2326 Q. What is it to Alexandria?
A. I can't give you that positively; I haven't got the necessary data to give it to you.

Q. You know the rate on soap from St. Louis to New Orleans, give us that, L. C. L. and carload both.

A. Soap, carload, St. Louis to New Orleans, 22; less carload, 25 cents.

Q. Give me those corresponding rates to Little Rock?

A. St. Louis to Little Rock, carload 33.

Q. L. C. L.?

A. 49.

Q. Give me the rates on beer, carloads, St. Louis to New Orleans?

A. 21.

Q. That is to New Orleans?

A. Yes.

Q. Give me the beer rate to Little Rock, from St. Louis?

A. 27.

Q. Give me the first class rate from St. Louis to Paragould, Ark.?

A. 81.

Q. What is it to Memphis?

A. 65. The first class rate to Paragould is governed by Western classifications, and the rate to Memphis is governed by Southern Classifications.

Q. Give boots and shoes?

A. I would have to have the Southern Classification.

Q. Boots and shoes would be in a classification?

2327 A. Not necessarily.

Q. Give us some other rate; have you a carload rate?

A. The only thing you could successfully compare, without having the classifications, before you, would be some commodity; that is what I have been giving you.

Q. Take a shipment of boots and shoes from St. Louis to Paragould, and similar shipments from St. Louis to Memphis, and give us the rates, and take packing house products, L. C. L.

A. That is, St. Louis to Paragould, and St. Louis to Memphis.

Q. Yes, sir, I have used various illustrations, but I will ask you if it is not a fact, that there is a large list of special commodity rates from St. Louis to this territory, effective for many years, what you might call Mississippi River points, and such rates are considerably lower than rates to intermediate points in Arkansas from St. Louis?

A. The Mississippi River points territory carries a great many commodity rates and a great many class rates, governed by different classifications different from the classification west of the river, which would result in somewhat lower rates in that territory.

Q. Isn't it a fact that there is a large list of rates from St. Louis to New Orleans that are lower than the rates for the same articles into Arkansas?

A. That is true.

Further examination postponed.

2328 H. C. HALVERSON, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HARROD:

Q. What is your name?
A. H. C. Halverson.
Q. What is your age?
A. 24.
Q. What is your occupation?
A. I am chief clerk to the Assistant General Passenger Agent.
Q. Where?
A. Little Rock.
Q. How long have you been so engaged?
A. I have been here since the 21st of March.
Q. This year?
A. Yes, sir, 1910.
Q. Were you connected with the Iron Mountain passenger service in Arkansas, prior to that time?
A. I was with the Missouri Pacific-Iron Mountain system in St. Louis.
Q. Are you familiar with the prices for which transportation is sold by the Iron Mountain, and for which it has been sold for the last six months in this state?
A. Yes, sir.
Q. Tell us the forms of passenger transportation you sell and the prices?

2329 A. Do you mean local and coupon?
Q. Anything that you sell in the way of passenger transportation?
A. We have local tickets on sale between local stations on our line, and we have coupon tickets on sale to foreign lines, and we have various issues of mileage books.
Q. Tell us about tickets within Arkansas, and mileage books that are used within this state and the rate?
A. In regard to the mileage, the Southwestern Passenger Association, of which we are a member, sells a mileage credential book in Arkansas, that is sold for a dollar; but there must be 2000 miles used in Arkansas, and there is a refund made down to two cents a mile.
Q. It costs the user two cents a mile, plus one dollar?
A. Yes, sir.
Q. He pays 3 cents, and gets a refund of one?
A. Yes, sir, but on some lines, there is a two cent rate; but he does not get that originally on the Iron Mountain.
Q. I am talking about the Iron Mountain.
A. Where it figures two cents a mile, there is no refund; usually, the only case in which he gets a two cent rate is where it is a competitive rate.
Q. Do you sell 500 mile mileage books?

A. That is $10, good locally on our line in Arkansas.
Q. Good anywhere in Arkansas?
A. Yes, sir, on our line.
Q. It is selling now for $10?
A. Yes, sir, it formerly sold, up to about a month ago, if I am not mistaken, for $12.50.
2330 Q. They did sell for 2½, but now it sells for 2 cents?
A. We have two five hundred mile books on sale; I have that circular; it may be the Arkansas book that still sells for $12.50.
Q. Those books are sold at all stations in this state, are they?
A. Yes, sir, and our coupon offices are provided with books.
Q. And they are sold for 2 cents?
A. No, that is in Kansas; in Arkansas they are sold for 2½.
Q. Where are they selling at 2 cents?
A. In Kansas, interstate, between St. Joe, Missouri and some other points, and that is competitive business we have up there.
Q. You are selling those in Kansas for 2 cents, are you?
A. Yes, sir, that is straight 2 cents a mile, and there is no refund, and these mileage books are sold there.
Q. Now, at competitive points in this state, you meet the competition of the Rock Island and these other people who are selling for 2½, don't you?
A. Where we have competition we do, but between some points we don't meet their rate.
Q. At every place the Rock Island touches out of Little Rock, and that your road touches, wouldn't you meet their rate?
A. Not at all points; it depends upon our main line points.
Q. You advertise to meet competition, don't you?
A. No, sir, not between all points.
Q. Don't you advertise that you sell these mileage books
2331 for 2½ cents, in order to meet competition of all your competitors?
A. That is not my understanding of it, no, sir.
Q. You say at some points, competitive points, you make rates to meet the rates of competitors, and some you do not; where are those points you speak of?
A. Our rate to Memphis, Tenn. is the same from Little Rock as the Rock Island; they make that rate being the short line, and we meet that rate.
Q. Tell me some competitive point you don't meet the rate?
A. I couldn't say positively whether we hold up our Little Rock to Helena rate or not; we hold up our rate, but I don't know whether,—exactly what the Rock Island fare is, but I don't think we would meet that rate, on account of our main line; if I am not mistaken, our rate between those points is $3.70, and the Rock Island rate was formerly that, but whether they reduced that when they went back to 2½ cents, I couldn't say positively.
Q. What is the rate to Ft. Smith?
A. $4.70, I think.
Q. What is the Rock Island rate?

A. The same thing; we meet their rate; 2½ cents figured on their line, would make less than 3 cents on our line.

Q. How about from here to Hot Springs?

A. We meet their rate in that; they make that rate on 2½ cents; we are the short line in there from Benton to Hot Springs,

2332 but we meet their fare, which is $1.55.

Q. Do you know any place out of Little Rock that you sell a ticket higher than the Rock Island rate, that the Rock Island goes to?

A. Crossett, Ark., our rate is higher than theirs.

Q. Have you a through line to Crossett, Ark.?

A. No, sir, we come back in there from Montrose; and also to Warren, Ark., and there is the same condition exists there; that is back off on a branch line of ours.

Q. That is the round about way of getting there?

A. Yes, sir.

2333 THOS. MCCUTCHEON, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. I wish you would state your name, age, residence and occupation?

A. Thos. McCutcheon, residence Argenta, 1020 Poplar St.

Q. What is your occupation?

A. Switchman.

Q. How long have you been working as switchman?

A. I have worked there off and on since 1880.

Q. How long have you worked at Argenta?

A. From 1903.

Q. Working there yet?

A. No, sir, not since the first of this year.

Q. And you are not employed as switchman now?

A. No, sir.

Q. What company have you been working for?

A. Iron Mountain.

Q. Working in the Iron Mountain yards at Argenta?

A. Yes, sir.

Q. The yards of the Little Rock Division of the Iron Mountain road?

A. Yes, sir.

Q. Are you familiar with the way freight trains are handled in these yards?

A. Yes, sir.

Q. I wish you would explain your duties as switchman?

2334 A. Our duties as switchman, when a train comes into the yard, after it is carded, we break it up, put each car where it belongs in different tracks for different points.

Q. How do you know where each car belongs?

A. By the number on each car.

Q. That is designated on the car for the information of the switchmen?

A. Yes, sir, the contents and number of the station.

Q. I wish you would explain what is done with a through freight train coming in from St. Louis say, and what would it largely be composed of; how would you handle it, explain it in your own way?

A. It is broken up, just as I told you; I never saw a through train that came in that didn't have to be broken up.

Q. What do you mean by being broken up?

A. Where were different cars that didn't go through with that same train, cars for different points in it; I never did see a through train for the south from the north go straight through.

Q. Some of these gentlemen high up in the operating department of the roads have compared their through trains to a bridge, have compared a bridge running through the state to their through trains. Is there anything like that?

A. No, sir.

Q. You did not discover the bridge?

A. No, sir.

Q. What difference is there between the bridge and the actual facts?

A. Now, I have seen a fruit train come, that there would
2335 not be anything done to it, but to change the caboose.

Q. That would be from the south?

A. Yes, sir.

Q. Have you seen many of those?

A. No, sir.

Q. Have you seen anything else but a fruit train now and then?

A. A vegetable train, onion train.

Q. Some onion train from southern Texas?

A. Yes, sir.

Q. You have found a few of those?

A. Yes, sir.

Q. They are the only bridges you discovered?

A. That is all.

Q. The bridge only worked occasionally in going from Texas through to the north; the bridge didn't from the north when it came down south?

A. No, sir.

Q. What do you do with the cars in the train as they come in, you speak of breaking them up; that is a technical term that you understand, but we don't just explain that operation?

A. There is different tracks designated for different cars for different points; all cars that would go to the Valley, there is a track they go on; also, we set north and south cars for different tracks.

Q. And with the exception of these few onion and fruit trains, that come in here, every train you handled was broken up in
2336 that way?

A. Yes, sir.

Q. And new trains made out of these trains that had been broken up in that way?

A. Yes, sir.

Q. Was there any difference in handling the carloads that would come in, say from St. Louis, than there would be handling carloads that were delivered to the railroad here, say from the brick plant or cotton seed plant, or any other industry in Little Rock, after it was delivered to the railroad, would there be any difference in the handling of that than there would be in this train from St. Louis?

A. No, sir, they would be all handled in the same way.

Q. Of course, before it was delivered to the road, a car would be set out to the industry's switch, and loaded there, and then delivered to the road?

A. Yes, sir.

Q. The same would be true in St. Louis or wherever the car originated, that same service would be performed elsewhere?

A. Yes, sir.

Q. After it is delivered to the road, the handling of the car originating locally would be the same as a car originating in St. Louis or Chicago?

A. Yes, sir.

Q. Suppose a car came down from the Ft. Smith branch, or came up from Pine Bluff, how would it be handled?

A. The same way as the other; if it came from Fort Smith, it is switched in the Fort Smith yard, and it is set out on the track;
if it was going north, it would be set on the north track,
2337 where they kept the north cars, and if south, it would be
on the south track, and then another engine comes up and gets it and switches it out again, down below the south end?

Q. To the main line track?

A. Yes, sir.

Q. As I understand you, all the trains, the freight cars are brought into Little Rock, they are broken up, and new trains made out, and they are sent out to their destination in that way.

A. Yes, sir.

Cross-examination.

By Mr. MOORE:

Q. I suppose from your statements, that trains sometimes come into Little Rock from St. Louis with cars that are destined to Texas and cars destined to points in Louisiana—that is true, is it?

A. Yes, sir.

Q. When a train of that character comes, what do you do in the yards at Argenta?

A. Break it up and switch out the cars that would go to Louisiana on a different track from what would go to Texas.

Q. You place the cars that go to Louisiana on the tracks from
which it would be taken to the Valley line, do you not?
2338 A. Yes, sir.

Q. What do you do with the cars that are going to Texarkana?

A. Put them on the south track.

Q. Suppose that train was going right on through, no occasion for it to stop here?

A. We would let the cars go back on the train.

Q. The cars destined to Texas on the main line, would go right on back on the main line?

A. That is after you switch them here.

Q. What switching do you do of cars going through on the main line to Texas?

A. If they are shipped in altogether, which they are very seldom, you would not probably be required to handle them at all.

Q. Unless it is necessary to handle them in your yards, they sometimes remain on the track and you switch off the Louisiana cars and put them on the Valley track?

A. Yes, sir.

Q. You call the line that goes down the Arkansas River into Louisiana the Valley line, do you not?

A. Yes, sir.

Q. Have you ever seen any through trains carrying grain from the northwest to points south or east of here?

A. Yes, sir.

Q. Is that handled, going from points northwest to territory south and southwest of here, in a solid train?

A. Yes, once in a while.

Q. Is it necessary to break those trains up?

A. Not unless there would be a bad order car.

2339 Q. They frequently come through in solid trains?

A. I don't think I have ever seen very many solid trains of grain.

Q. Those that are through trains, solid trains do go through?

A. Yes, sir, if there are no bad orders to switch out.

Q. There is no switching done at all in Little Rock?

A. No, sir.

Q. You compared the switching for the purpose of collecting the cars that were located at the local industries around Little Rock?

A. Yes, sir.

Q. What service is rendered in getting those cars ready for shipment out of the station?

A. They are taken from this side over to the other side of the river, just like other cars.

Q. Let's assume that there is to be a carload shipped from the Dickinson Brick Factory, tell me the entire service connected with the handling of that car?

A. If it would go south, it would be taken from here over to the other side of the river and put on the track where there were south cars, and possibly be there for a day or whatever time until the first train went out, and if they didn't have too much tonnage of perishable freight, that car would go.

Q. Where would you take it from?

A. We would take it from the brick yard.

Q. How would you get it to the yards?

A. Take it out empty out there.

Q. And you would have to do that switching?
2340 A. You would have to handle the empty and loaded car too.
Q. You would have to switch that car out to the industry whether it was a brick factory or some other sort of factory?
A. Yes, sir.
Q. There to be loaded?
A. Yes, sir.
Q. Then what would be done with it?
A. It would be switched out again and taken back over to the Argenta yards.
Q. What would you do with it when you got it to the Argenta yards?
A. If it went south, it would be put on the track that holds the south cars.
Q. Then what would you do next?
A. If we was making up a train for the south——
Q. You didn't make up a train for just one car, did you?
A. No.
Q. You would put it on the same holding track, wouldn't you?
A. Yes, sir.
Q. Until there were enough cars to make up a train going in the direction in which that particular car was going?
A. Yes, sir.
Q. When you had gotten enough cars together for that purpose, what would you do?
A. Make up a train.
Q. Composed of those cars?
2341 A. It all depends; if it was what we call a short load, for the first or second or fourth station down the line, those cars are kept by themselves, and they don't go in through trains, they go on locals.
Q. Tell me just how those are handled, tell me how you handle the cars containing shipments from local industries, that are carried out of Little Rock on the locals?
A. They are handled just the same as any other train.
Q. You see I don't know how any other train is handled, give me the details of that?
A. We would go over to any of these industries, switch those cars out, if they were loaded, and bring them back; possibly there would be empties and loads mixed up together, and some would be for the north and some for the south or west, wherever they were doing, and they would have to be all switched on different tracks and kept there until there was a train order; if there was enough cars to order a train, they generaly ran one.
Q. Then what was done?
A. That is all we have to do—put on a caboose and engine.
Q. That is the way you would handle a local?
A. Yes, sir.
Q. You would make up a train composed of those cars that would go to local points in the state?

A. If there was enough of them; if there wasn't, we would probably put on some through loads.

Q. Next, describe the process of handling cars that are destined to points outside of the state.

2342 A. Yes, they are handled about the same way.

Q. Is it usual in a train made up here at Little Rock, composed of cars going to points in Texas or Oklahoma or Louisiana, or are the cars that you wish to send to points outside of the state, usually hooked on to some passing through train that comes along from St. Louis or from some other shipping center?

A. Yes, sir.

Q. Which course is pursued?

A. They would possibly go with that train that came in if it was perishable freight, perishable goods; after they collect up enough here,—they are all kept separate here, perishable cars and other freight cars, and that train that came in from St. Louis, might only have one or two cars that would go locally on the next train.

Q. I am asking you what the common practice is, not with perishable cars alone; do you make up trains to go to points outside of the state here at Little Rock, or do you attach cars containing goods to be shipped into other states to passing through trains; do you understand that question?

A. I think I do.

Q. Which course do they pursue?

A. Both, at times.

Q. Which course is more commonly pursued?

A. The more common, I guess, would be on through trains.

Q. How do you handle a car loaded at one of the industries, which you want to attach to a through train, to take to a point in Texas?

2343 A. If it was a through car, it is just throwed on with the through cars.

Q. You would first send the car to the place where it is to be loaded?

A. Yes.

Q. And then you ship it back and put it on the proper track in the yard at Argenta, until a through train goes, say from St. Louis to a point in Texas, where that shipment is directed?

A. Yes, sir.

Q. When that train arrives, the switching engine takes it off the holding track and couples it on to the through train?

A. Yes, sir.

Q. That is the process in that respect?

A. Yes, sir.

Q. If you are making up local trains of cars loaded at industries, you handle them in the same way I indicated, as far as collecting them is concerned?

A. Yes, sir.

Q. You first get them from the industry?

A. Yes, sir.

Q. You put them on some holding track?

A. Yes, sir.

Q. When you get up enough to make a train, these cars are assembled on some holding track on which they can be carried to the various points out in the country; that is correct, isn't it?

A. Yes, sir.

2344 Q. Is there a class of trains passing through Little Rock from trade centers out of this state, called Red Ball trains?

A. Yes.

Q. Do you know what a Red Ball train is?

A. Yes, sir.

Q. What is that?

A. That is supposed to be first class freight.

Q. How are those trains handled here?

A. They are handled just like the rest; I never saw a through Red Ball train go through here.

Q. Did you ever see one of those trains to which cars were attached, handled at this point?

A. Yes, sir.

Q. How are they handled?

A. They are handled just like all the rest.

Q. Now, let's see; suppose there is a train of that character originating in St. Louis and going to Dallas, Texas, made up of cars made up at St. Louis of cars destined to Dallas, Texas; that train arrives at Little Rock, and may be you have one or two cars at this point which you desire to go to Dallas, Texas; now, would there be anything necessary in the way of switching, except to switch those cars on the track and couple them on that train?

A. Not unless there was some to come out.

Q. My question indicates the situation; I didn't say there were any to come out; that is what you would do in that case?

2345 A. Yes, sir.

Q. If another train was to come along containing cars for Alexandria, La., and some cars for Dallas, Texas, then you would separate them, and put cars that were going to Alexandria on the Valley track?

A. Yes, sir.

Q. And if the cars were in good condition that were going through to Dallas, they would go right on through on the main line?

A. Yes, sir.

Q. As I understand you, the services rendered here in connection with through trains, is simply in shifting the cars onto the proper tracks, to enable them to go to points beyond that they are destined to?

A. Yes, sir.

Q. You don't handle trains of through cars?

A. No, sir.

Q. Are you in the railroad service now?

A. No, sir.

Q. How long since you went out of it?

A. The 10th, I believe, of December.

Q. Did you sever your connection with the railroad voluntarily, or were you discharged?
A. No, sir, I was not discharged.

Redirect examination.

By Mr. HILL:

2346 Q. Mr. Moore has put a question to you about a supposed through train from St. Louis to Dallas, did you ever see one of those?
A. No, sir.
Q. That is one of those bridges, isn't it?
A. I never saw one; there is always cars to take on or put off.
Q. He supposed a through train from St. Louis to Alexandria, did you ever see that?
A. I believe I saw one of wheat once.
Q. In your five years' experience, you found one of those that was travelling on the bridge?
A. Yes; I don't remember seeing any more, but there might have been more; I wasn't there day and night.
Q. You worked your eight or ten hours each day?
A. Twelve hours a day.
Q. In your five years experience, working 12 hours a day, you say you saw one of those?
A. I don't remember but seeing one train of wheat.
Q. I mean of any other freight train—through train.
A. No, sir, except fruit.
Q. Any other train going south from the north; you have already explained there are a few trains of onions and fruit going north?
A. Yes, sir.
Q. Your answer to his questions on that, that you had some cars here you might hook on them, that would be the practice if there was such a train, but in fact, I understand there would be no
2347 such trains?
A. There would be some to put on and some to come off?
Q. Wouldn't there be more than that to do?
A. The caboose to change and engine.
Q. What about inspection?
A. All those trains have to be inspected.
Q. Those through trains going through on the bridge have to be inspected like the others?
A. Yes, sir.
Q. And if you found them in bad order——
A. They would have to be set out on the bad order track.
Q. All those through trains undergo an inspection just the same as local or any other trains?
A. Yes, sir.
Q. How long do these through cars, as a rule, stay here?
A. Sometimes they stay a good deal longer than others; sometimes if they are Red Balls they are switched out; they always stop the Red Balls and keep them for Red Ball trains

Q. They wait here in the yards until there is enough cars of that class to make up a train?
A. Yes, sir.
Q. Suppose it was not Red Ball, would they usually stay?
A. They often would go out before the Red Ball; that is, if there was enough of a train.
Q. It would just depend on the kind of traffic that was coming in, which would go out first, whether the Red Ball or what do
2348 you call the other?
A. Dead freight.
Q. It wasn't a question of just shooting them through?
A. No, sir.
Q. It was a question of making up trains?
A. Yes, sir.
Q. That is the way it is practically handled?
A. Yes, sir.
Q. Whatever may be the theories on the subject?
A. Yes, sir.
A. As a rule, how long are these through cars held in the Little Rock yards?
A. They don't usually stay very long.
Q. That would vary with the seasons of the year?
A. Yes, sir.
Q. Depend on how the traffic was moving and things of that kind?
A. Yes, sir.
Q. Mr. Moore is assuming that this through train that was running over here like over a bridge, was on the through track; would it stay on the through track?
A. No, sir.
Q. Main track?
A. No, sir.
Q. Even this one train of wheat that went through here on a bridge didn't stay on the main track while it was here?
A. No, sir.
Q. It was switched off too?
2349 A. Yes, sir, they have to go into the yard with the others.
Q. If there was a bad order car which had to be set out, the train was broken up?
A. Yes, sir.

Recross-examination.

By Mr. MOORE:

Q. Did you ever see a through train from St. Louis to some point south of here passing this place?
A. Never did.
Q. Did you ever see through cars from St. Louis going to points south?
A. Yes, sir.
Q. What is the largest number of those cars you ever saw collected in one train?

A. I couldn't tell that; I think about thirty-eight or forty loads south, and fifty north.

Q. You have seen trains come here then with thirty-eight or forty loads; that is, that many cars from St. Louis to points south of this?

A. Yes, sir.

Q. Didn't that constitute a train?

A. That is south from here.

Q. Didn't that constitute a train?

A. Yes, sir, south.

Q. Tell me again what a Red Ball train is?

A. It is first class freight, supposed to be first-class freight;

2350 I have seen lumber Red Balled, perishable I presume.

Redirect examination.

By Mr. HILL:

Q. In your answers to Mr. Moore's last questions, did you mean that you had seen 38 cars come from St. Louis in one train, and those 38 cars carried straight on south?

A. Yes, sir.

Q. That was the maximum that you did see?

A. Yes, sir.

Q. Was there any set out from that 38 cars?

A. Yes, sir.

Q. That is what you mean, that that was the most you had ever seen?

A. Those were empty stock cars.

Q. That was as many as you had ever seen that went on one train, that would come in on one train?

A. Yes, sir.

Q. Of empty cars; that would be very many more than you would see of any other kinds?

A. Yes, sir.

Q. I suppose empty stock cars would be about the principal cars you would see going through?

A. Yes, sir, and empty foreign cars.

Q. Stock traffic through Arkansas on the Iron Mountain is comparatively small?

A. Yes, sir.

2351 Recross-examination.

By Mr. MOORE:

Q. Did you mean to state in answer to questions just asked you by counsel, that you never saw a train of 38 or 40 cars going south from St Louis except empties?

A No, sir, I never did

Q. You never saw a train then of loaded cars, containing from thirty to forty loads, going south from St. Louis to points south of Little Rock?

A. Not in one train.

Q. Were you here in 1907?
A. Yes, sir.
Q. October, November and December two years ago last fall?
A. No, sir, I guess I was in St. Louis.
Q. I thought you said you have worked here five years?
A. Yes, sir, but I was in the hospital a week or two weeks or three weeks.
Q. Any longer?
A. No.
Q. Just think a little bit and see if you cannot recall that there were a great many heavily loaded trains of grain passed through in solid trains, going from points in the northwest to points south and east of here, say to New Orleans, in the fall and winter of 1907?
A. No, sir.
Q. You cannot recall that?
A. No, sir.

And further deponent saith not.

2352 It was agreed, that GORDON N. PEAY, if present, would testify as follows:

My name is Gordon N. Peay: I am of lawful age, and live in Little Rock, and have been engaged in the real estate and banking business in this City for many years, and am acquainted with rental values of property in said City: I am well acquainted with the Pratt Hotel, and was in 1907: I think the reasonable rental value of the hotel, including bar, dining room, news stand and lunch stand, would be $350.00 a month, in 1907.

2353 R. E. KIMBELL, a witness of lawful age, being duly produced, sworn and examined on behalf of the defendant, testified as follows:

Direct examination.

By Mr. HILL:

Q. When we were last in session I requested you to make a couple of exhibits, which you wanted to have time to prepare carefully, have you done so?
A. Yes, sir, I have.
Q. Will you please present each one of them and state what it is as you present it?
A. The first exhibit, which will be "Exhibit G" is a statement covering six months ending December 31, 1907, prepared in answer to the request of Judge Hill, showing assumed revenue on the following bases:

State freight 96.1% increase over actual: interstate freight 9.4% increase over actual; state passenger, 35% increase over actual; interstate passenger, no increase over actual; miscellaneous, no increase over actual; and also showing the actual operating expenses, taxes and rentals divided between the several classes of traffic on
2354 the basis of the assumed gross revenues, ascertained as above; also double the assessed valuation divided on the same gross

revenue basis and the percent of return on said valuation.

Those, as I understand it, are the features you desired covered in this exhibit.

Q. In your other exhibits you carried forward 100% on freight and 25% on passenger for the supposed added intrastate expenses: I do not remember whether I asked you to carry that forward on this exhibit or not.

A. You did not and I did not do it. I confined the statement to your request literally.

Q. Mr. Kimbell, I see from your exhibit G that the return upon your property, assuming an increase of 96.1% on intrastate traffic, 9.4% on your interstate traffic, and 35% on your intrastate passenger traffic, will give you a return of 18.58% upon your property.

A. That is correct, without considering any extra cost for handling state business.

Q. That is what you would call the straight revenue basis, is it not?

A. Yes sir.

Q. And if the extra cost of one hundred or more percent on the freight, and twenty five or more percent on the passenger, were added to that, it would produce a still higher return upon your property as shown in your previous exhibit—I mean, the
2355 intrastate property.

A. It would produce a higher rate than is shown on the previous exhibits, for the reason that the revenue has been increased on this arbitrary basis.

Q. Mr. Kimbell, will you answer as to the other exhibit which I requested you to make?

A. Yes, sir. I submit a statement which will be Exhibit "H" being a statement supplemental to Exhibit No. 33 and prepared in answer to the request of Judge Hill, showing operating expenses, taxes, rentals, etc. and double the assessed valuation of property, divided between the several classes of traffic on basis of actual gross revenues for the six months ending December 31, 1907.

Q. Mr. Kimbell, this would show a return upon your property for this period on a straight revenue basis of 12.84% of all business done in Arkansas, would it not?

A. Yes, sir.

Q. And for the intrastate business done in Arkansas, freight and passenger combined, for the given period, without any extra cost for either freight or passenger business done in the State, as over the interstate of 7.71% upon the property?

A. Correct, yes, sir.

The exhibits "G" and "H" are marked respectively and are in the words and figures following to-wit:

For Exhibit "G", see Volume 9, page 5783.

For Exhibit "H", see Volume 9, page 5785.

2356 Cross-examination.

By Mr. MOORE:

Q. You stated this exhibit was supplemental to Exhibit 33: is that correct?

A. That is correct.

Mr. HILL: I intended to ask Mr. Kimbell something else and I may as well ask him now Mr. Moore.

Q. Mr. Kimbell, I wish you would give us the original or a copy of the contract between your road and the Iron Mountain for that leased road and trackage of the Paragould line.

A. Do you intend to put that in evidence? It is a very voluminous document.

Mr. HILL: I presume we can agree on that. I want to put part of it in evidence. You had better let us have the contract and we can agree on what we want.

Mr. MOORE:

Q. Mr. Kimbell, how was the 96.1% increase in interstate freight shown on Exhibit G, just filed by you, arrived at?

A. The 96.1% is the percentage of increase in the average revenue per ton per mile for the month of January 1909, over the average revenue per ton per mile for the six months ending December 31, 1907.

The 9.4% is the corresponding average increase on the interstate traffic.

Q. Would it be a fair assumption to compare the average revenue on business that moved in January, 1909, with the business that moved in the last six months in the year 1907?

A. I should say that it would be unfair.

2357 Q. I wish you would state your reasons for that opinion.

A. The assumption of an increase in the revenue for the six months ending December 31, 1907 as submitted by Judge Hill, which assumption is predicated on the average revenue per ton per mile for that period, being the same as the average revenue per ton per mile for the month of January, 1909, is, in my judgment, misleading, and in fact is highly improbable.

Such a difference in the average revenue per ton per mile on state freight as exist- between the six months ending December 31, 1907 and the month of January, 1909, might occur with exactly the same rates in effect for both periods. I say it might occur, for the reason that the character of freight handled during the two periods might vary sufficiently under exactly the same rates to materially change the average revenue per ton per mile.

Since this question was raised by Judge Hill a few weeks ago, I have investigated in a general way the character of the principal commodities handled during the two periods referred to and find these important changes in the commodity movement, which would

under any set of rates, have the effect of increasing the average revenue per ton per mile:

Coal, a low rate commodity, constitutes 5.5% of the total state movement for the six months ending December 31, 1907, and but 1.02% for January, 1909.

2358 Forest product material, another low rate commodity, constitutes 29.40 percent for the six months ending December 31, 1907, and but 13.96 percent for January 1909.

Now, on the other hand, the following important commodities which are rated higher than coal and forest product material show a proportionate increase in volume handled as follows:

Grain and grain products for the six months, 3.87 percent, and for January 1909 5.86 percent.

Hay, for the six months period 13.30 percent, and for January 1909, 18.56 percent.

Cotton seed products for the six months' period 5.58 percent, and for January 1909, 15.67 percent.

This market shifting in the character of tonnage handled would in itself make a radical change in the average revenue per ton per mile even though there was no change in the rates, and in my opinion, accounts in a large measure for the difference in the averages of state business during the two periods.

The length of haul of the differently rated classes and commodities is also an important factor to be considered in a comparison of this kind.

Exhibit 35, which covers the six months' period, shows an average haul of 43 miles for state freight and 232 miles for interstate freight.

2359 Exhibit A, which covers the month of January 1909, shows an average haul of 41 miles for state and 222 miles for interstate freight.

It is a recognized fact that as the haul increases the average revenue per ton per mile decreases. It is, therefore, to my mind, misleading to make a comparison of the average revenue per ton per mile for one period with another unless the character of tonnage carried and the haul for each kind of tonnage is identical.

I might say in this connection, that there is apt to be confusion in the use of the terms "average rate per ton per mile" and "average revenue per ton per mile". As heretofore explained, the average revenue per ton per mile may vary to a marked extent during any two periods, notwithstanding the fact that the identical rates prevailed during both periods.

The Interstate Commerce Commission uses the language "average receipts per ton per mile." It appears proper to use the term "average revenue per ton per mile" or "average receipts per ton per mile", which, as is well known, is determined by dividing the ton miles for all classes of freight handled into the revenue derived from all classes of freight handled. A change in the average revenue per ton per mile, or the average receipts per ton per mile, does not necessarily mean a change has occurred in the rates, as a variation of tonnage would of necessity produce a change in the revenue.

2360 As regards the assumption of 35 percent increase in state passenger revenues and no increase in interstate passenger

revenues, I wish to state that in my re-direct examination, in answer to a similar problem submitted by Judge Hill, I stated that the assumption of 33⅓ percent increase in state freight rates without any increase in interstate freight rates was in my judgment an incorrect one and for that reason principally the example submitted by Judge Hill was not one that could be practicably applied to any condition that might exist.

I wish to reiterate these remarks in connection with the problem submitted by Judge Hill, which assumes an increase of 35 percent in the state passenger revenue and no increase whatever in the interstate passenger revenue.

So far as my observation and study of adjustments, brought about by rate changes goes, I should say that it would be an impossible condition to assume that the state passenger rates would increase 35 percent without any increase whatever in the interstate passenger rates.

The passenger rate men, however, would be better able to explain that than I would.

Mr. HILL: Are you referring to Mr. Stone?

A. I say most any passenger rate man. Those are my reasons why it seems to me that the comparison proposed by Judge Hill is not a fair one.

Mr. MOORE: Mr. Kimbell, you were asked by Judge Hill,
2361 in reponse to which question you filed exhibit G, the following question:

"If the rates which produce the increase in average revenue per ton per mile as shown in your January 1909 statement of 96.1 percent on interstate freight had been in effect during the last six months of 1907, I want you to calculate the gross revenue of your freight traffic for that period, assuming now that the increase has been during that period."

I want to ask you, Mr. Kimbell, if it was a change or variation in the rates that produced the difference in the revenue per ton per mile, or was it the change in the character of the tonnage and commodities that were handled during the two periods, and was the result affected also by the differences growing out of the long and short haul, as between state and interstate business?

A. I would say in answer to that, that there are three elements which were affected, namely:

There was some change in rates; there was likewise a very marked shifting in the character of the tonnage handled, and there was a difference in the length of haul, all of which had its effect.

Q. I want you to state if the change in the revenue per ton per mile on your railroad would run uniform in any two months—is it likely that it would, or is there a variation from month to month of the revenue per ton per mile, both state and interstate, as compared with the last six months of 1907?

2362 A. There are some very wide fluctuations, I have noticed, in the average revenue per ton per mile.

Q. Is not that a necessary result of the variations in the character of the tonnage that is handled from time to time?

A. I think that fact is amply proven by periods when there are no changes in rates and there are still these changes in the average per ton per mile.

Q. I was going to ask you that question: if those variations did not occur when the rates were the same?

A. It is true they do, yes, sir.

Q. And that grows out of the shifting of the business as it occurs from time to time, the shifting in the character of the business handled?

A. If the majority of our tonnage handled for six months was low class tonnage, it is reasonable to suppose that our average revenue per ton per mile would be low. Now, if on the other hand, next month the majority of our tonnage handled was high class, it is likewise reasonable to suppose that the average revenue per ton per mile would be higher.

Q. I believe you have already stated that your Exhibit G provides for no extra cost in handling state freight?

A. It does not.

Q. Mr. Kimbell, Exhibit G shows an increase of 35 percent in passenger revenue, and no increase in interstate:

I want you to state what the facts are in regard to whether
2363 there was a corresponding change made in interstate passenger rates at the same time there was a change made in intrastate passenger rates.

A. As I understand it, there undoubtedly was. The passenger people adjusted their interstate rates as soon as possible after the change occurred in the state rates.

Q. So that increase in the revenue from one class of passenger traffic without any increase in the other, did not grow out of difference of rates, did it——

A. No sir.

Q. —because the rates were kept uniform?

A. That would be an absolutely impossible condition, I should say.

Q. Now, does this 35 percent represent any actual figures, as shown by the operations of your road, or is it merely an assumption?

A. It is an assumption, based on the conclusions, I think, that were reached at Little Rock last Spring when Judge Trieber considered the proposed advance in passenger and freight rates. The general average at that time, as I recall it, was about 35 percent in the passenger business.

Q. What I want to get at is this: you have assumed in here an increase of 35 percent in passenger revenue over the actual.

A. Yes, sir.

Q. Where does that assumption arise?

2364 A. That was Judge Hill's suggestion.

Q. But is it an actual fact, do your records show that?

A. No, sir, that absolutely is not according to the books.

Q. Your Exhibit H, which is an extension of a former exhibit filed by you as exhibit No. 33, by showing the return on the basis of exhibit 33—upon the value of the property, this return shown on

exhibit H is based on straight revenue, without any allowance for extra cost, is it not, Mr. Kimbell?

A. Yes, sir.

2365 R. E. KIMBELL, recalled, testified as follows:

Redirect examination.

By Mr. HILL:

Q. Mr. Kimbell, I did not quite follow you in your comparative figures that you gave in that six months' period and the January, 1909, period: let us see if I can get it: you give the percentage on coal, for the six months' period as 5.50 per cent, I believe?

A. Yes, sir.

Q. That is intrastate or interstate?

A. This is all intrastate business I am speaking of.

Q. Did you compare the coal movement of the interstate with that?

A. No, sir.

Q. Would that be of any value, to make a comparison of the intrastate coal of the six months' period with the one month period, when you do not compare it with the interstate coal movement for the same period?

A. For the purpose of determining the average revenue per ton mile on state business, I should say that interstate had nothing to do with it.

Q. Take this for illustration: I see that in January your coal, intrastate traffic, was only one per cent. Suppose that the coal, intrastate traffic, was only one per cent during that month?

A. That would not affect the average revenue per ton per mile on state business.

Q. No, but it would affect the relation of the revenue be-
2366 tween the state and the interstate business, would it not?

A. Yes, sir; these percentages I was giving there were to show the impracticability of comparing the average rate per ton per mile of state business for the month of January, with the six months' period.

Q. The comparison we were seeking to call your attention to was the relation between state and intrastate, 9.4 per cent increase of interstate and 96.1 per cent on the state:

Will these figures throw any light on that, when you do not compare the tonnage for the corresponding period for the interstate?

A. I should say it would. Your whole question is predicated on a 96.1 per cent increase on state freight.

Q. While there is only 9.4 per cent increase on the interstate?

A. Yes, and we seek to show you in these figures I have given you here, that that 96.1 per cent is not a normal condition. That is to say, that it could be entirely different from that.

Q. You seek to show that there is a great fluctuation in your revenue, is not that it?

A. I seek to show that while that difference occurs there it could

occur without any change in rates whatever; it could occur by reason of the shifting of traffic.

2367 Q. That shows that there is great fluctuation in your revenue?

A. Yes, sir.

Q. It is rather an unreliable yardstick to measure your expenses by if it fluctuates that badly, is it not?

A. Yes, sir. It is very good, I will say, for operating comparisons. That is about the only use we ever make of it. It is all right to compare January 1909——

Q. You are talking about ton miles and I am talking about ton revenue: this shows a great fluctuation in your revenue, does it not?

A. It does.

Q. Does not that show that your revenue is a very unreliable yardstick to measure your expenses by?

A. No, sir. I should say that the revenue reflects the returns on the different classes of traffic that may be handled.

Q. It is the return from the traffic?

A. Yes, and if the revenue is large, I think it is logical to conclude that we have handled some high-class freight and are therefore entitled to high revenue.

Q. That is merely a question of revenue, but you are seeking now to measure your cost by your revenue and you are showing very great fluctuations in your revenue?

A. Yes; fluctuations, it seems to me, are quite proper; if the revenue is high, it is reasonable to suppose the expense would be high for handling that high class traffic.

2368 Q. And if the revenue is low, the expense is lower, is that your theory?

A. That would be the logical conclusion, on a revenue basis. It reflects the service.

Q. Mr. Kimbell, could you give us your figures showing the percentage of coal tonnage in January 1909, interstate, and your coal tonnage for the six months' period, and the lumber, grain, hay and cotton seed products, just like you have on this?

A. It can be done, but I would dislike to have to do it.

Q. It seems to me that that is a necessity growing out of your exhibit here.

Mr. MOORE:

Q. Would that involve a large amount of labor and expense?

A. Yes, sir.

Mr. MOORE: Then I want to advise Mr. Kimbell not to do it, unless he wants to do it voluntarily. You have accountants, and our books are open to you.

Mr. HILL: He has put one side in evidence and it looks to me as if it is up to him to put in the other side.

The MASTER: Mr. Kimbell, tomorrow morning you can show us what labor is necessary in relation to furnishing that, and about how much it will cost, and then we will decide that.

The WITNESS: As I understand you, Judge, I am to let you know approximately the amount of labor involved in fur-
2369 nishing this information?

The MASTER: The amount of labor involved and the cost.

Mr. HILL:

Q. I want to get a little information about this: in making these percentages, are those tons or ton miles?

A. Ton miles?

Q. On both sides?

A. Yes, sir.

Recross-examination.

By Mr. MOORE:

Q. You were asked, Mr. Kimbell, if it would not be necessary to show the character of the tonnage that was moved in interstate traffic in January 1909, in order to balance or explain the statement contained in your testimony as to showing what the intrastate tonnage consisted of:

I want to ask you if there is any connection whatever, in so far as an explanation of the fluctuations are concerned, between the two?

A. Absolutely none.

Q. The revenue shows a certain increase of revenue derived from each kind of traffic?

A. Yes, sir.

Q. And the effect of the increase, or the cause of the increase in each one is independent of the other, is it not?

A. Yes, sir. Those are the two factors on which Judge
2370 Hill based his problem, one an increase of 96.1 per cent on state, and the other an increase of 9.4 per cent in the interstate. Those factors are absolutely determined independent of one another. The wide disparity led me to make an explanation of why the 96.1 per cent was so large, and it developed the fact that that could be large without any change in rates whatever.

Q. I believe you testified that coal was a low rate commodity, did you not, Mr. Kimbell?

A. Yes, it would be.

Q. When is a large volume of coal moved in Arkansas?

A. I am not very familiar with that Judge. I suppose——

Q. Don't you know whether in the summer or winter months?

A. It is used in the winter months and I assume it is probably shipped in summer and stored.

Q. At what season of the year is most of the cotton crop of Arkansas moved?

A. That is moved in the latter months of the year and the early months; from October to February.

Q. Now, without multiplying illustrations, I want to ask you if there is not necessarily large fluctuation in the monthly revenue derived from the operation of the railroad growing out of the character

of tonnage that is moved at different seasons of the year and different months?

A. Yes, sir; I think there is.

Q. That might be the case when the average revenues per
2371 annum, round the period of a year, would not fluctuate a great deal?

A. Yes, sir.

Q. And that is a fact, is it not?

A. That is quite true.

Q. The variations in receipts for short periods like monthly periods, does not indicate large fluctuations in the annual earnings of railroads, does it?

A. Not unless the receipts are light during the entire year.

Q. I am not speaking of that. I mean the various months that constitute the fiscal year. The fact that that varies and fluctuates and the earnings in some months are higher than in others, is not inconsistent with a large degree of uniformity in the annual earnings of railroads?

A. No, sir. The monthly returns are apt to vary considerably and still the annual returns may be normal.

Redirect examination.

By Mr. HILL:

Q. That is true both of state and interstate?

A. Yes, sir, I think so.

Q. Is there about the same fluctuation in interstate and in state?

A. I think so; they travel fairly uniformly.

Q. They go hand in hand, do they?

2372 A. That may not be literally true, but I think they go very well together.

Q. Figuratively speaking, a kind of "Siamese twins"?

A. That, however, is not true of expenses, Judge.

Q. Mr. Kimbell, you stated there was no relation, as I understood it, between these movements in the intrastate business and the movements in the interstate business: is that the way you——

A. Not so far as determining the two independent averages which you used as factors in your problem are concerned. There is no connection.

Q. Is there not supposed to be really a relation between the rates, state and interstate?

A. There is, yes, sir.

Q. Do you know what it is?

A. Know what the relation is?

Q. Yes.

A. It would be very difficult to say. It varies considerably, I guess.

Q. Do you know any body that does know?

A. In a general way I think our traffic men have told you that the relation exists.

Q. Mr. Watson is authority on that proposition?

A. As far as the rate feature goes, yes, sir.

Q. Do you stand by what he says on that subject?
A. I think his testimony should stand on its own bottom. I think it is all right.
2373 Q. I want to know if you have any independent knowledge of that relation, other than what Mr. Watson has given?
A. Yes, I have a general knowledge, to which I think I have testified before, to the effect that there is a relation.
Q. I understand that, but what is it?
A. That is a very difficult thing to say.
Q. I know it is.
A. It has been explained to you by Mr. Laing, who was just on the stand, that his passenger interstate rates were increased gradually, not all at once.
Q. But I am trying to get at how much?
A. All I can say on that, Judge, is that when you find it, I would like to see it.
Q. I have been trying ever since this case began to find it. I want you to refer me to somebody that can give it to me, if you cannot do it yourself. You cannot undertake to do it?
A. No, sir.

2374 J. D. WATSON, a witness of lawful age, being duly produced, sworn and examined, testified on behalf of the defendant as follows:

Direct examination.

By Mr. HILL:

Q. Have you the data ready which I called for heretofore?
A. It was the rate on beer from St. Louis to Little Rock and from Milwaukee to Little Rock, and the divisions of the rate from Milwaukee to Little Rock, via St. Louis. I presume you intended to say East St. Louis. The movement is not via St. Louis.
Q. You mean it would be handled through the Illinois line of the Iron Mountain?
A. It would be handled through East St. Louis. The movement from Milwaukee would not be via St. Louis. It would not cross the river here.
Q. It would run down the Illinois Division of the Iron Mountain, cross the bridge, and then over to Dexter, Missouri, would that be the way?
A. Yes, sir.
Q. And strike the main line of the Iron Mountain at Dexter, Missouri?
A. No, it would strike the Cotton Belt at East St. Louis; from East St. Louis via the Cotton Belt.
Q. Your illustration is on the Cotton Belt?
2375 A. Yes. The rate from St. Louis to Little Rock, carloads, minimum weight 20,000 pounds in wood, and 24,000 pounds in glass, is 27 cents per hundred pounds.
The rate from Milwaukee to Little Rock, subject to the same minimum weight, is 34 cents per hundred pounds. The rate from

Milwaukee to Little Rock would divide to East St. Louis 10.3 cents; south, 23.7 cents.

The next illustration is packing house products:

The rate from St. Louis to Little Rock, carloads, 31 cents per hundred pounds.

The rate from Chicago to Little Rock, 38 cents per hundred pounds. This rate divides to East St. Louis 7.8 cents; south, 30.2 cents.

Q. Is not the local rate from East St. Louis the same as from St. Louis?

**A. It is.**

Q. Then if you took St. Louis instead of East St. Louis, it would be the same figures?

A. The same figures identically; that makes no difference. I am simply trying to clear you up as to the movement of the beer, which does not move through St. Louis.

Q. I had in mind the Iron Mountain.

A. The next illustration is farm wagons, from Moline, Illinois, to Little Rock: 38 cents per hundred pounds. From St. Louis or East St. Louis to Little Rock, 33 cents per hundred pounds.

The rate from Moline to Little Rock divides to East St.
2376 St. Louis 10 cents, and south 28 cents.

The next illustration was the rate on boots and shoes, from St. Louis to Paragould, Arkansas, which is 81 cents per hundred pounds; that is less than carload. And boots and shoes from St. Louis to Memphis, Tenn., which is 65 cents per hundred pounds.

Q. Would that not apply to carloads where there is L. C. L.?

A. That is an any quantity rate. Packing house products, less than carload, St. Louis to Paragould, fourth class, 43 cents per hundred pounds. I specify the class there for the reason that there are different classes of packing house products in less than carloads, and the fourth class covers the large majority——

Q. That is the principal movement of packing house products?

A. Yes, sir. To Memphis, less than carload would be 26 cents per cwt.

Q. What is it to Paragould?

A. 43 cents.

Q. Is that the same proportion as to carload?

A. The carload to Paragould is 26 cents, and the carload to Memphis is 21 cents.

Q. That Memphis business would go right through Paragould on its way, would it not?

A. With us, yes.

Q. Are those all the illustrations I asked you for?

2377 A. Yes, but I believe the conditions in connection with that should be explained, so you will fully understand.

The rates from St. Louis to Memphis and to all Mississippi River points are governed by conditions that do not control the Arkansas rates. The rates to Memphis in no way control the rates to Arkansas, except it be a combination through Memphis may in some case make a lower rate than the established rate from St. Louis to

points in Arkansas. The rates to Memphis are very low on account of conditions over which the railroads west of the River have no control.

Q. You mean that the rate to Memphis plus the local rate back?

A. No, the rate to Memphis, plus the rate from——

Q. Take Paragould: that would be a back-haul.

A. Yes, but take a station in southern Arkansas, say Hope, for example, would make a lower through rate than the established basis operated by the lines west of the River, under the Western Classification; the rates to Memphis being governed by the steamboats and——

Q. How about an illustration of a shipment between Memphis and Fair Oaks?

A. That would hardly make a lower rate on the Memphis combination, than the straight rate; the distance being so short from Memphis is the reason of that.

2378 Q. That is a junction point, is it not?

A. Yes, but it amounts to very little.

Q. The business at Fair Oaks, I suppose is nothing, but would not that be a base for other rates out of there?

A. No, it happens not.

Q. Usually that is the case?

A. That is the case in some common points, but Fair Oaks is not one of them. Another feature in connection with that is the fact that the rates to Memphis, being a shorter distance, are lower than the rates to New Orleans. In other words, the governing factor is distance, both to meet the water competition——

Q. The governing factor was not distance between Paragould and Memphis?

A. The rates to Memphis have no effect whatever on the rates to Arkansas.

Q. The length of haul had nothing to do with the Memphis-Paragould rate on shoes, as illustrated?

A. It does not affect the rates to Arkansas as compared to rates to Memphis, for the reason that the Memphis rates do not base the rates to Arkansas.

Q. Do I understand that that resolves itself into this: that the element of distance enters into the water rates, but does not enter into railroad rates?

A. The element of distance enters into all rates.

2379 Q. Both water and rail?

A. Yes, sir.

Q. It did not in the Paragould shipment?

A. It does enter into the Paragould rate.

Q. How do you figure that?

A. The rate to Paragould is less than the rate to Brinkley——

Q. It is more than the Memphis rate and Memphis is a longer distance?

A. The rate to Memphis is not in any way governed by the rate to Paragould and vice versa.

Q. But in those two instances which are an illustration, the length of haul cuts very little figure in those rates?

A. The length of the haul cuts no figure as far as the Memphis rate is concerned, with us. We don't make the Memphis rate. We simply meet the competition fixed for us by water and rail.

Q. Then you move traffic on that Memphis rate without regard to the distance?

A. Some of the Memphis rates. There is some of the traffic we cannot participate in.

Q. But all that you do participate in, you move regardless of that, to meet your competitors?

A. To meet competition, yes, sir.

2380 Cross-examination.

By Mr. MOORE:

Q. I wish you would explain what you mean by stating that your road does not participate in some of this Mississippi River business.

A. Well, the best example of it is a concrete case I had yesterday. We were offered a shipment of cement, a number of cars to Memphis. We found that the rate was nine cents. By the time we paid the arbitrary up to and beyond our line there would be nothing left for our services.

That is only one example. There are many, any number of them.

Q. What is the principle upon which traffic men ace in deter? mining when they will not solicit or take business, under conditions such as you had in mind when you made the statement that you did not participate in some business?

A. When the business is unremunerative or will not yield a fair rate for the services we are required to perform after deducting the arbitrary we must pay.

Q. Is that a rule that obtains generally in railroad traffic, in cases where the normal conditions are affected or modified by competitive conditions or commercial conditions, which would render it necessary to modify the normal rates?

A. I think it is a universal rule. It is with our road
2381 and I presume with all other lines.

Q. Do you know from your intercourse with traffic men generally, what the rule is?

A. I should judge, from the various tariffs and the exceptions provided in the tariffs, that that is the case.

Q. Now, state what that competition at Memphis, to which you referred in your testimony in chief, is.

A. The water competition, the short line from St. Louis to Memphis, the Illinois Central.

Q. In what way does that modify conditions from what they would be otherwise?

A. The water lines would make a lower rate than the rail lines there, their cost being less, and necessarily they would establish a

lower rate to secure the business as against the railroad, and the rail lines would meet those rates. If the rail line had terminals of its own in Memphis and had no expensive charges or arbitraries to pay to get the traffic, they could probably afford to meet the River competition; whereas a line situated as the Cotton Belt could not afford to do so.

Q. Is the mileage scale abandoned in fixing rates under such abnormal conditions as you have just been describing, or is it still observed?

A. It is still a controlling factor.

Q. What are the conditions as between St. Louis and New Orleans, we will say? I take it Memphis is one of the important basing points between St. Louis and New Orleans, and New
2382 Orleans, perhaps is the next: to what extent, if any, is the mileage scale observed in fixing rates from St. Louis to Memphis and New Orleans?

A. The water carrier, if he went to New Orleans, for example, would have about twice the mileage than to Memphis, or possibly more, and their rate to New Orleans would be higher than the rate to Memphis, and the railroad lines competing for the traffic would be in the same position. The rates to New Orleans would therefore be higher and to that extent the mileage would indicate conclusively that the length of haul had a great deal to do with the rate applied.

Q. Where the conditions are normal and not modified by unusual commercial or competitive conditions, to what extent is distance a factor in determining the rate of transportation?

A. To a large extent.

Q. Please explain it.

A. Take any tariff that provides rates from a given point to a line of railroad, the longer the distance the greater the rate would be. Now, where a common point happens to intervene and that common point is governed by other conditions aside from the mileage feature, or has conditions aside from the mileage feature, which control the rate, that particular common point may carry a lower rate than the stations on either side of it; but those stations, not being controlled by the commercial or competitive condi-
2383 tions, would still be governed by the mileage feature. In other words, it would be controlled by the mileage.

Q. You mean to say, then, that aside from some special point that was affected by the unusual condition, the rates to intermediate points would still be governed by the mileage scale?

A. To a very large extent, yes. I can give you any number of examples of that.

Q. Give us some, please. I will be glad if you will give us some examples by citing cases that occur in practical operation on the main line of the Iron Mountain and the main line of the Cotton Belt roads, to points in Arkansas.

A. Well, bagging and ties, is a fair example. The rate to Moark (which is the first Arkansas station) from St. Louis, is 17 cents.

The rate to Little Rock—the first station south of Little Rock.

would be 20 cents. The rate to Little Rock would be somewhat lower. I haven't the figures with me, though.

To stations south of Benton the rate would be 24 cents, and as the distance increases the rate increases.

Q. What are the conditions that produce a lower rate to Little Rock than to Benton or Malvern, stations beyond?

A. At Little Rock the distance is shorter, and while at Benton and Malvern you have practically the same competitive conditions you have at Little Rock, that competition is governed also by the mileage basis. They have to haul the business further and
2384 therefore they cannot afford to make as low a rate for the longer as for the shorter distance, and they adjust their rates accordingly.

Q. Do the same factors prevail at Memphis, New Orleans and other points that are governed by water competition?

A. The factor as to distance, yes.

Q. As to the graduation of rates, now?

A. As to that also, the rates being higher for the shorter than for the longer distance—I mean, lower for the shorter than the longer distance.

Q. To what extent does that rule apply to different classes of commodities, high and low classes of commodities?

A. Well, in some cases the low class commodities are grouped in zones. Is that what you mean?

Q. Yes. Go ahead and explain it.

A. Where the zone basis is applied, the rate may be a little high to the first point in the zone and probably low for the last point in the zone, but as a general average the rate for the entire zone would be considered fair.

Q. I will call your attention to an instance that is in evidence here:

It is shown that here is a large territory embraced in the lumber zone extending from some point south of the Arkansas River, perhaps to the Gulf of Mexico:

I wish you would state how those rates compare relatively, in point of reasonableness, at the northern and southern points
2385 in that zone, and the intermediate points, on shipments to commercial centers north, such as St. Louis and Kansas City.

A. Well, from the lumber zone, which starts at Little Rock or the Arkansas River, and goes to the Gulf, the rate from the first stations in the zone—Little Rock, Pine Bluff, etc., may be considered fair rates.

The rates from the lower end of the zone are considered very low.

The rates from the central portion, or the average distance which we haul lumber, are considered reasonably low under the present conditions.

Now, it does not follow that all of the lines that operate from that entire zone, each have those rates. Some of the lines will operate from one point on their own rails, or all points on their

own rails, but I don't believe any one line would operate the rates from all points in the zone, or could afford to do so.

Q. Why?

A. On account of the arbitrary they would have to pay to get the traffic to their rails.

Q. Because it would be unremunerative?

A. Yes, sir.

Q. Do any of the railroads ever indicate on their tariffs, or the sheets that they issue in connection with their tariffs, that they will not handle certain territory, or handle certain parts of that territory?

2386 A. Any common tariff covering several railroads carries an exception to the application of the rates, which shows conclusively that each of the parties to that tariff do not participate in all the rates shown therein, and are not in a position to handle all the traffic covered thereby.

Q. Do you know about the case that came before the Interstate Commerce Commission, in which Oklahoma parties made complaint that the rates to the southern parts of the lumber zone in Oklahoma, extending north, were too high?

Mr. HILL: I am perfectly willing that Mr. Watson be examined on things I bring out, but I do not care to make him your witness in the trial of new matters.

Mr. MOORE: Well, I will withdraw that if you object to it.

Q. Now, Mr. Watson, on your direct examination you were asked to give the rates over the Missouri Pacific Railway, under the joint tariff, from the Illinois coal fields to Little Rock, and I think you showed instances in which higher rates were applied for shorter distances, than the rates for some other points further away from the point of shipment: Will you state, first, whether those conditions are exceptional or not?

A. They are exceptional.

Q. What cause brings that about?

2387 A. I happen to be very familiar with the rate to Little Rock, that is adjusted upon the Memphis combination, the rate to Memphis from the Illinois fields being governed by the condition of water competition, resulting in a rate of $1.00 per ton from the Illinois mines to Memphis.

The rate from Memphis to Little Rock, established by the Rock Island, the short line, based upon the Arkansas rate was $1.25 per ton, making the rate to Little Rock $2.25, which is the actual Memphis combination; and it was necessary for the lines operating direct to use the same basis in order to secure any of that traffic.

The rate to Monroe, Louisiana, which is $2.00 per ton, is a rate established by the one line operating from the Illinois coal fields to Monroe, to meet the rate in effect and operated by the lines from the Alabama district to Monroe, which also has its direct rails from the Alabama district to Monroe. To meet the Alabama competition it was necessary to put the Illinois coal into Monroe on the same basis.

That condition is also true at Tallulah, Louisiana, and points in that immediate vicinity which are in competition with the V. S. & P.

Q. What is the rule among traffic men when conditions of that sort arise, and the rates, due to those competitive conditions, are such that the business could not be carried without loss, or at least on a remunerative basis?

2388 A. The best explanation is this: that the Cotton Belt does not operate a rate from the Illinois mines to Monroe for that very reason—we can't afford to do so, the arbitrary up to and beyond our line being so much that the balance would not justify the services we would perform.

Q. Your attention was called to a number of points in Arkansas and Louisiana, further from the coal fields than Little Rock—Monroe, Louisiana, is one; Tallulah is another, where the rate is the same as Little Rock. It was shown that those shipments pass through the state of Arkansas, but not through Little Rock, but they are a longer distance: does that come within the explanations you have made as to the reasons for this abnormal adjustment of Little Rock rates, as compared with other points?

A. It does. The Iron Mountain reaches the coal fields and the destination points, and it is a one line haul from the coal fields to the destination; they don't divide the revenue with any other line.

Q. And the Little Rock rate is fixed by the conditions you spoke of a little while ago?

A. Yes, and it is considered a very low rate.

Q. You were speaking a while ago about the rate on beer from Milwaukee to St. Louis and East St. Louis.

Is there any terminal service or empty car service at St. Louis which enters into the rate?

2389 A. Yes, there is a terminal service in St. Louis on all beer. There is no beer shipped in East St. Louis that amounts to anything, and in St. Louis there is a terminal charge as well as a river transfer charge, to get it to our tracks.

Q. Empty car service?

A. Yes, sir.

Q. You also testified in your direct examination—your examination in chief, that the rate on shoes and dry goods from St. Louis to Little Rock, was $1.00 per hundred pounds; from St. Louis to Alexandria, $1.25, St. Louis to New Orleans, 90 cents: What brings about that condition?

A. The rate to New Orleans is fixed by water competition and by the direct lines to New Orleans.

The rate to Little Rock is standard first-class, and the rate to Alexandria the same. The rates to Alexandria are governed by conditions which do not govern at Little Rock or New Orleans.

Q. What are they?

A. A combination of locals through some Louisiana point or are fixed by differentials as is Shreveport.

Q. You have already stated, I believe, that the relative rates to which your attention was called in the examination in chief, when your attention was called to certain instances of shipments to Arkan-

sas and points in Louisiana—you have already stated those conditions: I wish you would state the relative volume of railroad
2390 traffic that is affected by those conditions, as to the whole traffic of the Cotton Belt road, so far as you know it, and to the Iron Mountain and other roads which operate in that territory.

A. Upon the Cotton Belt tonnage that is affected by those conditions as to the Memphis and other Mississippi Valley points, it amounts to a very small proportion—less than one per cent.

The Iron Mountain tonnage that would be affected thereby would be relatively the same as to their volume.

In other words, the lines west of the river cannot afford to meet the larger number of the rates that are operated to New Orleans, on the heavy moving commodities.

Q. And therefore they do not attempt to do it?

A. No, they don't.

Q. What lines do carry the most of that business and why?

A. The low grade lines and the short lines, the Illinois Central and the Mobile & Ohio.

Q. Why are they in a condition to handle it?

A. On account of their short mileage and the fact of the volume of tonnage that would be northbound to them. They have to have something to operate southbound and they can afford to handle this business cheaper on account of the direction of their traffic.

Q. What would be the result if they did not handle it?

A. It would go to the water lines. In other words, if they
2391 were to advance their rates——

Q. Is their reciprocal tonnage affected in any way by it?

A. It is affected very materially by it.

Q. Mr. Watson, you have just described the exceptional conditions that affect traffic growing out of the low rates on the Mississippi River and the short lines:

Now, referring more particularly to that class of traffic where that exceptional condition exists and you are forced to modify your basis of rates growing out of the exceptional conditions, what to any extent is the rule as to the classification and the application of rates according to the classification of the commodity, applied on river transportation?

A. I don't believe the river lines have any classification. They usually have a commodity rate.

Q. I mean this: you have in railroad operation, your first, second, third and fourth classes?

A. Yes, sir.

Q. And you charge higher rates for the first and have a descending scale down to the fourth class: what I want to know is if that system of graduation of rates is what is placed by these exceptional conditions as between the different classes of freight transported.

A. To some extent, yes, sir.

Q. To what extent, and how far?

2392 A. In a commodity rate the article is taken out of the classification and a specified rate provided therefor——

Q. Is there any difference made in the application of rates to the

different commodities? You say many of them are taken out of the class rates and put into commodity rates. Is there any difference in application of rates to different kinds of commodities? I mean, in that class of traffic which you charge a rate for—we will say dense articles, do you charge a different rate for heavy, dense articles than you do for lighter and more valuable articles?

A. That particular feature of it has to be taken into consideration by the steamboats and water carriers as well as by the rail carriers. It costs them more to handle that particular class of business. The heavier article is the less cost per ton. For instance, the steamboats charging for wooden ware or other light articles make their charges accordingly, but if they were going to handle grain or something that is heavier they are willing to apply a lower rate to it.

Q. Is that not the same distinction which you drew on a former examination, as to the rates being graduated according to the character of the article, the bulk, weight, density and value?

A. Steamboat lines use approximately the same method for graduating their rates as the railroads do.

Q. Does that system prevail in graduating rates as to traffic
2393 which is affected by the river conditions on the railroads?

A. Yes, it does.

Q. That practice is not eliminated, then, by these exceptional conditions you speak of?

A. It is not.

Redirect examination.

By Mr. HILL:

Q. Is there river classification permitted?

A. Not that I ever heard of.

Q. They make a package rate, don't they?

A. They make a package rate, a rate in cents per hundred pounds, for instance, so many cents per thousand for brick.

Q. They make a whiskey rate, do they not?

A. A rate per barrel.

Q. Then you adjust your rate in the western classification according to the river——

A. I don't understand what you mean.

Q. I understood your answer to Mr. Moore amounted to the fact that you took into consideration the classification the steamboats were making when you took your rates out of the class list and put them in the commodity list. Do you mean river classification?

A. River rates, not classification.

Q. It amounts to the same thing, does it not?

A. Yes, sir.

2394 Q. You do not like the term of "river classification?"

A. I do not want to talk about something I don't know anything about.

Q. Do the steamboat men get together like they do in the railroad lines and have a classification committee?

A. I have never heard of a steamboat classification. I have seen steamboat tariffs, but not classifications. They usually adopt the

southern or western or whatever classification happens to be operated.

Q. The river traffic runs on a package basis?

A. They have a great many commodities that are based upon package rates.

Q. Does not that river rate on all class rates and many of the commodities applied from St. Louis which you have given, also apply to Vicksburg, Greenville, Helena, and other points?

A. That is true.

Q. Where the distance is very different and much less than to New Orleans?

A. The distance is much less than New Orleans but the distance has a good deal to——

Q. Do these points I have referred to Helena, Greensville and Vicksburg, take the New Orleans rate?

A. No, there are quite a number of differences and exceptions in the tariff.

Q. As a general proposition that is the rule, is it not?

A. I cannot say generally.

2395 Q. Class rates all do, don't they?

A. Class rates do.

Q. And most, if not all, the commodities do, do they not?

A. I could not say that without examining the tariff carefully. My recollection is there are quite a number of exceptions.

Q. It is the rule to change them or to make exceptions, is that about the way to put it?

A. As far as Helena, Vicksburg and New Orleans are concerned, yes.

Q. You refered to this terminal charge on beer that you were going to ship from St. Louis to Little Rock there would be the same terminal charge on that beer that you shipped to New Orleans, at a less rate, would there not?

A. Yes, sir.

Q. I did not understand about that one per cent that you referred to in your examination a while ago. Do you mean that the traffic from St. Louis to New Orleans would be one per cent?

A. No, I mean that the traffic that the St. Louis Southwestern would move from St. Louis to Mississippi Valley points, including New Orleans and Memphis, would be less than one per cent of our traffic. In other words, we handle very little of it.

Q. They are dominated by the New Orleans rate?

A. Very little.

2396 Q. How much of your traffic is dominated by the Memphis rate?

A. Very little; Memphis, practically, alone.

Q. I thought from your testimony a little while ago that there were a great many combinations made on the Memphis rate?

A. No, I said the only combinations possibly would be the combinations in southern Arkansas and then it would be only in cases where the classification to Memphis was different than the classification to Arkansas on account of the class being different.

Q. What is the volume of traffic of the Iron Mountain that is dominated by the Memphis rate?

A. I don't know positively, but my understanding from the tariffs themselves would be that it amounted to very little.

Q. Is not all the traffic from St. Louis to Arkansas common points based on a differential——

A. The rates are differentially adjusted as to Memphis but they are not based on Memphis.

Q. What are they based on?

A. They are not based on Memphis and they are differertially adjusted over Memphis; there is a difference between a differential adjustment and a combination of locals.

Q. If there is a differential adjustment between St. Louis and Memphis that would control the movement from St. Louis
2397 to the Arkansas common points, would it not?

A. Not necessarily control it, but establish a parity as between the rates from Memphis to Arkansas points and from St. Louis to Arkansas points.

Q. That parity would be a fixed quantity?

A. It is a fixed quantity.

Q. It would not be a parity then, it would be a combination of those rates?

A. The fixing of those rates establishes the parity.

Q. It is a question of a different use of terms but you get the same proposition?

—. ——.

Recross-examination.

By Mr. MOORE:

Q. In order to clear up something that there may be some confusion about, I want to ask you in regard to the basis of rates:

I want to ask you if the rates from St. Louis to Arkansas points are not made on differentials over the rate from Memphis to Arkansas and not on the rates to Memphis, that is, from St. Louis to Memphis?

A. The rates from St. Louis to Memphis do not enter into the adjustment to points in Arkansas. The rates from Memphis to Arkansas points plus certain differentials established the rate from St. Louis to Arkansas points.

2398 JAMES C. LINCOLN, a witness of lawful age, being duly produced, sworn and examined on the part of the defendant, testified as follows:

Direct examination.

By Mr. HILL:

Q. Mr. Lincoln, will you please state your name, residence and occupation?

A. James C. Lincoln; St. Louis, Missouri; Commissioner of the Merchants Exchange Traffic Bureau.

Q. Before you were commissioner of the Merchants Traffic Bureau, Mr. Lincoln, in what occupation were you engaged?

A. Just before accepting my present position, I was with the Missouri Pacific Railway System, as Assistant Freight Traffic Manager.

Q. How long experience did you have as Assistant Freight Traffic Manager, or in the traffic department of the Railroad?

A. My entire life almost has been spent in the railway service. I entered the service in 1876 and left it in 1906.

Q. In what department of the service has your work been, Mr. Lincoln?

A. My original work was that of a general utility boy around headquarters. I was then in the office of the Superintendent
2399 of car service and from that in the office of the Master of Transportation; then in the General Freight and Passenger office as chief clerk. That, however, was in my association with the St. Joseph & Denver City Railway, now the St. Joseph & Grand Island Railroad, which company I left in September, 1888, to accept service with the Missouri Pacific Company.

I served the Missouri Pacific Company at Atchison, Kansas, for one year, in charge of their Central Branch and their Nebraska Division, in the Traffic Department. I then came to headquarters and served through the various offices from Assistant Freight Agent to Assistant General Traffic Manager.

Q. Was the St. Louis Iron Mountain & Southern a part of the system that you served?

A. Yes, sir.

Q. Are your duties in your present position such as keep you in touch and familiar with the rates prevailing in the southwestern country?

A. Quite generally, yes, sir. I have to keep in touch with the general rate adjustment to this entire section. I have to watch the adjustment from other markets in competition with St. Louis.

Q. In what year did you leave the railroad service?

A. In May, 1906.

Q. Mr. Lincoln, I wish you would state from your familiarity with the making of interstate rates, the controlling factors in the making of such rates?

2400 A. The controlling factors in the making of rates, state or interstate, or the foundation upon which a rate is made, is the maximum rate allowed by law, either state or interstate, or on through business the combination of state rates. They are departed from as commercial conditions require.

Q. What consideration in the making of interstate rates is usually given to the cost of actual service performed in transporting the traffic under the given rates?

A. Very little consideration is given to the actual cost of the service in making rates. Rates are made generally based upon competition or commercial conditions. The traffic man necessarily should be informed to a greater or lesser extent, as to what it costs, but in the making of any individual rate he is unable to determine what is the cost of handling that individual traffic.

Q. What information or statistics do the railroad companies have before the traffic men when they make rates, that is, as to costs?

A. Well, there are all kinds of statistics that reach a traffic man, or the traffic man can avail himself of them if he wishes to—as to the movement of the tonnage, the various commodities making up the tonnage, car movement and the averages. The ordinary traffic man is not well versed upon the expense of conducting the transportation as to any commodity on any division, but deals with totals.

Q. In fact, there are no statistics made by the railroad com-
2401 panies operating in this immediate section of the southwest that have the cost of transportation of any given commodities, are there?

A. Not that I know of. I never saw them.

Q. In your experience you did not meet such?

A. Not such statistics.

Q. In fixing rates from large distributing points, say St. Louis to Arkansas, and through Arkansas to points beyond, say New Orleans and the Texas common points on the other side, how largely, if at all, does the cost of the length of the haul from Arkansas points to New Orleans and to Texas common points, determine the rates that are fixed for these various movements?

A. In the fixing of rates from St. Louis to New Orleans or from St. Louis to Texas points, or from St. Louis to Little Rock, to what extent do the Arkansas rates enter as a factor?

Q. No, I say, to what extent does the length of the haul to these respective points, and the cost of the service, enter into making those rates, from St. Louis to New Orleans, from St. Louis to Texas points, or St. Louis to Little Rock; what consideration is given the cost of the service and length of the haul in fixing those rates?

A. Length of haul in the state or entire haul?

Q. Well, I will state it broadly: the length of the haul at all. What consideration is given to that in fixing such rates as I have
2402 mentioned.

A. Except in a very remote way, consideration is not given to the expense of conducting the transportation in making the rates from St. Louis to New Orleans; from St. Louis to Little Rock, or from St. Louis to Texas points.

Q. Mr. Lincoln, if you are called upon to divide the expense of traffic, state and interstate, under proper conditions, what formula would you use, or on what method would you proceed in dividing it?

A. That is a very, very broad question,—The question of the division of the expenses as between state and interstate. I have never been able to devise, or in my judgment, seen devised any method by which the expenses of the service could be separated.

I have had my views, but have never worked them out.

Q. Are there any controlling factors in the difference of the service, state or interstate, or the difference in long hauls and short hauls?

A. That is in connection with expenses?

Q. Yes.

A. In connection with the expenses of conducting transportation

there are controlling factors in the way of terminal expenses. There are controlling factors in the way of these short hauls being more expensive than the long hauls.

Q. How is that taken care of in practical railroading?

2403 A. In the adjustment of rates.

Q. The evidence in this case shows this—I will just speak in round figures—that the revenue per ton per mile on the state traffic is 12 mills and the revenue per ton per mile on the interstate traffic is 6 mills:

Do those statistics indicate to your mind that this extra cost for short hauls had been taken care of in the rates?

A. This would indicate to my mind that in a measure the short haul has been taken care of in the rate by the fact that the average rate per ton per mile is higher than for the longer haul.

Q. And that is the way, as I understand you, in which this extra cost of the short haul, terminals, etc., is taken care of?

A. It is contemplated in the rate adjustment, taken care of by the higher rates for the shorter hauls than for the longer hauls.

Cross-examination.

By Mr. MOORE:

Q. Mr. Lincoln, you think the length of haul affects the expense of conducting traffic, do you not?

A. Unquestionably the longer the haul the less the cost should be per ton per mile.

Q. What are the reasons that enter into and cause that result?

A. What are the reasons?

2404 Q. The causes of that.

A. The causes are the continuous transportation over divisions and that after freight is in movement it would be hauled greater distances without a progressive rate of expense for each mile hauled.

Q. There are two classes of interstate traffic; from one state into another, say adjoining states, and that which crosses states; the latter branch has been termed "trans-state" traffic in this case. A movement may originate in St. Louis and terminate in Galveston and it is a trans-state shipment in Arkansas because it has no origin or destination there.

To what extent does that enter into and affect the relative cost of transportation as between interstate, including that in interstate on one hand and intrastate on the other, in the state of Arkansas?

A. Well, I would say this: that business can be conducted with less expense which is the average shown by the result in the rate per ton per mile for the longer haul from St. Louis to Galveston than for a short haul within that distance, passing over the same line and in the same direction.

Q. Is there any other element, that in your opinion, would enter into the relative difference in expense than the short and long haul?

A. All things being equal, no.

Q. What is the service rendered with relation to trans-state traffic and interstate traffic, in the more limited sense that I ex-
2405 plained a while ago, in the State of Arkansas?

A. What is the relative service as between the trans-state and the interstate?

Q. Yes, in the state of Arkansas?

A. Well, within the state, on state traffic, terminal expenses are embraced in the rates.

Q. On what traffic?

A. On the intrastate or short haul traffic. The same terminal expenses are embraced in a rate on an average of a long haul. The continuous movement of freight for a long haul enables—when there is a volume of business to move—the conduct of that business cheaper than the short hauls, because the short haul is usually handled in local trains.

Q. Will you charge any terminal service on a trans-state shipment to the expense of conducting traffic in Arkansas?

A. No, there should be no expense charged in Arkansas for the terminal service.

Q. When you say there is a terminal service you mean the traffic itself requires a terminal service?

A. Yes, originally; there would be no terminal service on through business.

Q. How would it be in interstate traffic as distinguished from trans-state, from St. Louis to Little Rock?

A. There would be one service there in the state and one out of the state.

Q. How is it usually in state business?

2406 A. There are two terminal services in the state.

Q. Is there any material difference in the expense of conducting intrastate and interstate traffic, referring now to the state of Arkansas, without having to repeat that each time?

A. No.

Q. You think there is no very material difference in expense?

A. In handling state and interstate business?

Q. Yes.

A. No, sir.

Q. On what do you base that view, Mr. Lincoln, that there is no material difference?

A. I base that view upon the fact that an imaginary line does not increase expense. I support the proposition that there is a greater expense attached to the handling of short haul business, state or interstate, than on long haul business, state or interstate.

Q. Do you know the manner of handling state business that prevails usually on through lines of railroad, and particularly on the Iron Mountain in Arkansas?

A. That handles state business?

Q. Yes.

A. Why we have at Knoebel, Arkansas, we will say, a carload of lumber that is going to Little Rock, Arkansas. Now, the expense

attached to the movement of that car is the switching serv-
2407 ice at Knoebel in placing the car for loading by the shipper and in the placing of the car at Little Rock to the industry or team tracks for the unloading; two terminal expenses.

The expense of the movement of that car is no greater from Knoebel to Little Rock than it would be through Knoebel and Little Rock from a point north of Knoebel in Arkansas to a point south of Little Rock, Arkansas.

Q. Is the local business, intrastate business, conducted on local or through trains usually?

A. Ordinarily, all short haul business is conducted on local trains and the long haul business on through trains, irrespective of whether state or interstate.

Q. What proportion of state business is handled on through trains, would you say?

A. In Arkansas?

Q. Yes.

A. I doubt if there is a very great amount of Arkansas local traffic, that is, state business, handled on through trains. I imagine most of it is short haul and therefore would go on local trains.

Q. The statistics in this case show that the average haul, intrastate haul in Arkansas, is about 71 miles, and the interstate haul about 224 miles:

Now, what proportion of the interstate business would you say is handled on local trains?

A. What proportion of the interstate business in Arkansas
2408 is handled on local trains? From my general knowledge of the situation I would not say that there was a very large volume of interstate business handled on local trains. Of course, there is business out of Memphis, Tennessee, going into Arkansas, and considerable would be handled on local trains.

There is business out of St. Louis to Arkansas points that would be handled on local trains. And there is business out of Fort Smith to Arkansas points, that would be handled on local trains. There is business out of Texarkana that would be handled on local trains.

Q. You say business from St. Louis to Arkansas would be handled on local trains?

A. Yes, sir.

Q. Not on through trains?

A. On through trains to Poplar Bluff and local beyond, or through trains to the division points and local beyond.

Q. Suppose there is a car or train made up to go south from St. Louis to Little Rock; another to Texarkana and another to some point in Texas, perhaps: how is that freight handled?

A. Carload freight?

Q. Yes.

A. It should be and probably is handled on through trains.

Q. Which is the greater volume, the carload or less than
2409 carload, of interstate freight?

A. Interstate freight?

Q. Yes.

A. I imagine the carload business would be the greater volume of interstate business.

Q. It would be very much greater, would it not?

A. I think it would be materially greater. I have not the statistics on that.

Q. The statistics in this case show that 51% of the total traffic of the Iron Mountain Railroad Company consists of trans-state traffic and that 49 and a fraction percent is made up of interstate, and of the latter—according to my recollection—about 16% is state and the difference between that and 51% is interstate. I think I have stated it about correctly. I am not giving fractions.

Now, with those facts before you, what in your judgment would be the proportion of the entire interstate including in that term trans-state business that would be conducted on through trains rather than local trains?

A. Well, the percentages would indicate, and I think it is without question, that the trans-state traffic is all handled on through trains.

Q. You take that out at once?

A. The interstate traffic is very largely handled on through trains. State traffic is handled on local trains, very largely.

2410 Q. That is about as nearly as you can approximate it, I suppose?

A. About. I am speaking of Arkansas.

Q. This is all confined to Arkansas whether I so state or not.

Has your experience in railroad work been such as to qualify you to speak as to the difference in the expense of operating the local as distinguished from the through trains, in Arkansas?

A. No, I would not say that I could qualify myself to testify on the question of operating expenses. I have a general knowledge of it which I have ascertained by analyzing operating sheets.

Q. Then I will not ask you to go into it in great detail. But you know in a general way that there is a very large increased expense involved in the operation of local as distinguished from through trains?

A. There is a larger expense in handling local as compared with through trains.

Q. I would like you to state, in a general way, what produces that increased expense in the operation of local trains?

A. The increased expense in connection with the operation of local trains is the constant service that is required at the local points as they go along, in stopping trains and starting trains, as

2411 well as the switching service. There is also some additional expense attached to the conduct of the trains in the way of expense of employés' overtime, usually.

Q. Is there any other element of additional expense in connection with the labor feature, or are you familiar with that?

A. I am not.

Q. I mean, are the wages paid operatives on the local trains higher than wages paid on through trains?

A. I thought I covered that in increased cost of the labor on trains?

Q. You confined it in your answer to overtime but I mean now in the wage scale, the rate of wages paid?

A. I am not familiar enough with the wage scale to speak on that point. Some of those are based on the runs, allowing a man to make a certain amount for a certain run, on a mileage.

Q. You would say then, that there is very considerable increase of expense in the operation of local freight trains over through trains, would you not, Mr. Lincoln?

A. No, I would not say it was so considerable. When I say that, Judge, I do not want to be misunderstood in it.

Q. And I do not want to frame my question so as to mislead you.

A. I do not want to be misunderstood in connection with the operation of the local trains. The local train is handling
2412 interstate and state business at the same time; the expense goes to both.

Q. I am not speaking now of expense as applied to state and interstate. I am speaking of operating local——

A. The expense of operating the local trains is greater than the expense of operating the through trains.

Q. Is it not very considerably greater?

A. I don't think it is, but I am not competent to testify on the measure of it.

Q. You would not want to base an opinion on it?

A. I prefer not, if it be a final opinion.

Q. Let me ask you another branch of it: are you familiar with the manner of handling less than carload freights as distinguished from carload freights?

A. Oh, yes, sir.

Q. Is there any difference of expense growing out of the manner of handling those two classes of freight?

A. There is an additional expense upon the carrier in handling less than carload freight.

Q. What does that consist of?

A. They receive it at the station; they load it into the cars and there is a trucking and handling and loading expense at the station, in addition to that of the carload shipments; the carload shipments being handled by the shipper or receiver, and the less than carload being handled by the railroad.

Q. That is one very important element, too, is it not?

2413 A. Yes, sir, it is a very important element.

Q. Is there not another important element of added clerical expenses growing out of the fact that less than carload lots involve a larger number of way-bills?

A. There is an increased expense and a material expense in connection with handling less than carload business, in the way of way bills. It has to be way-billed and the way bills have to carry the description of the article shipped. The bills of lading, you understand, they do not have anything to do with them; the shipper make- out the bills of lading.

Q. I understand about the bills of lading, but the waybilling is done by the railroad, is it not?

A. Yes, sir.

Q. It is in evidence in this case that there are some carload shipments sometimes which involve 20, 30 or 40 different packages, maybe more; each one has to be billed separately to its destination, does it not?

A. No, one waybill is made for the entire consignment, from one consignor to one consignee.

Q. Yes, but suppose it goes to twenty different consignees?

A. Then there would be twenty different waybills; possibly there may not be. I have seen billings made on one waybill—from St. Louis, we will say, to Little Rock—of various consignments
2414 on one way-bills. However, there will be a separate expense bill issued.

Q. You have now in mind less than carload, interstate?

A. I have in mind all less than carload business.

Q. Let us take a local down in Arkansas: the train starts out at Little Rock on the main branch, we will say: say it has two carloads of less than carload freight—to illustrate my point better I will take one car—there is a car ladened with goods for Benton, for Traskwood, for Bryan and Malvern, Benton and Malvern being the most northern and southern and being about twenty or twenty-five miles apart. There we have four destinations. In that case, Mr. Lincoln, to distinguish it from the usual practice in interstate, that probably would consist of a great many shipments to different persons?

A. Yes, sir.

Q. It would be likely there would be a greater variety of shippers and consignees than there would in an interstate less than carload, would it not?

A. I don't know whether it would be a greater variety, but there is quite a variety.

Q. Now, all of that involves a further and considerable expense?

A. It involves an expense.

Q. Is there any expense growing out of that separate package movement in less than carload lots at the terminal
2415 station?

A. There is an additional expense in the handling of less than carload lots at the terminal station in the way of handling.

Q. As well as the originating station?

A. Yes, in the way-billing and the expense-billing of it.

Q. There is another feature of the operation of local trains. That is what is known as the "peddling trains": do you know what I mean, when I say peddling trains—a train that has to stop at all the stations for the purpose of delivering package freight carried in less than carload? That is very largely local freight, is it not?

A. Yes, that is local freight.

Q. Is not a very large part of the expense incident to running local trains resultant from that peddling business which necessitates the stopping of trains and perhaps the side tracking and the switching——

A. That, I stated, covered the extra expense of handling local trains.

Q. There is another feature I want to call your attention to while we are on this subject:

I told you a while ago that the statistics of the Iron Mountain in evidence in this case, show the average length of haul on interstate business to be 224 miles—I include all interstate——

2416 A. I understand.

Q. Now, is it not a fact that the trans-state movement if you were to segregate it from the other movements, would be very much longer than the state movement—I mean the interstate movement, in the state of Arkansas?

A. The average movement of the trans-state shipment would be greater than the average interstate shipment.

Q. The statistics to which I refer take no account of any part of the haul of trans-state traffic outside of the state of Arkansas. It may originate in St. Louis and go 150 or 200 miles before reaching Arkansas, and go 500 miles after leaving Arkansas, but that is not taken into account in these statistics. If you add the total length of haul of trans-state business and bring that into comparison, it would make the average haul very much more than the amount I told you, would it not?

A. I am not familiar with the statistics. I would say, of course, that the average length of a haul on trans-state business would be materially greater than the average length of the haul on an interstate shipment, as the average length of haul on interstate shipment may be greater than the average length for state shipment.

Q. But the point I want is this:

If you eliminate that part of the movement of the trans-state business which is outside of the state of Arkansas and con-

2417 fine it to the haul in that state, then you reduce very materially the average of what the total length of haul would be on that business, that part of the movement outside of Arkansas.

A. Certainly, it would.

Q. Is it not a fact in all railroad practice that the rates diminish as the length of haul increases?

A. That is the common theory and the common practice.

Q. Now, when Judge Hill tells you that the average revenue per ton per mile on state freight is 12 mills and on interstate freight 6 mills, is not a very large part of that difference accounted for by the fact that you have just stated—that is, that the rate diminishes as the length of haul increases in view of the fact that the length of haul is as 71 is to 224, and if you were to give the trans-state movement its full effect, would be very much larger; does not the increase in the length of haul——

A. The increased length of haul tends to reduce the average rate per ton per mile. That is the accepted theory and is the general result.

Q. Then if we were to take the revenue as representing rates the difference would be accounted for in that way, would it not, Mr. Lincoln?

A. The difference in the revenue?

Q. If you take the revenue which you heard represented to you, that would be largely accounted for in that way?

A. The increase in the revenue per ton per mile for
2418 short hauls as compared with the long haul is, of course, created by the difference in the rates.

Q. If you take it by the difference in the rates it would be accounted for very largely by the difference in the length of the haul?

A. Yes, sir.

Q. It would be diminished and the——

A. The rates are higher per ton per mile for the shorter than the longer haul.

Q. Is it a fact that the revenue per ton per mile represents the rates and affects the rates in view of the fact that when you take the receipts per ton per mile you make no distinction as to the commodities or length of haul, but the whole thing is just massed on one common average and put on a common level, disregarding all distinction of class of freight, and all distinction of rates and all distinctions of those elements that enter into the fixing of the rates? Is it not a fact that it reflects more the character of the traffic that is handled than it does the rate?

A. Well, the average revenue per ton per mile, of course, is the average of your total earnings all massed together, striking a general average, and it varies somewhat according as the commodity movement may vary or the character of the traffic may change. The test has been used but I do not know how correct it is.

Q. But it has not been used for the purpose of de-
2419 termining rates except in the aggregate, the total body of rates?

A. The total body of rates. One of the things that must be brought before a man in making rates is, what are the average earnings and what is the average cost.

Q. Let me ask you, Mr. Lincoln, is it not a fact that it might occur and does occur frequently, that you take two different periods of the year—take a month representing the movement of freight which characterizes the movement of that particular period, might it not be that a shifting of the tonnage of traffic—or whatever term you use—you understand what I mean——

A. Yes, sir.

Q. Might account for the very large difference in the earnings per ton per mile without there being any difference at all in the rates.

A. It would be—one commodity may predominate in one season and the next season there would be none, and another commodity takes——

Q. That is a rule that is generally recognized in all railroad circles I believe.

A. Yes, sir.

Q. You spoke about the rates, state and interstate; is it not a fact, Mr. Lincoln, when you come to compare state and interstate rates on the mileage scale for similar distances, that the state rate is as low or lower than the interstate rate?

A. Not generally.

2420 Q. I want to call your attention to——

A. That is not generally the case.

Q. Now, Mr. Lincoln, I will ask you to look at exhibit 37 filed by the plaintiff in this case and state what that shows to be the relation between state and interstate rates for the same distances; that is, the state rate in Arkansas and the interstate rate.

Mr. HILL: I believe I will object to that question. It is not cross-examination, and it is taking Mr. Lincoln into something that would not be fair unless he had Mr. Perkins' testimony. If Mr. Lincoln has the time to read that over——

Mr. MOORE: It is distinctly and directly cross-examination because you asked Mr. Lincoln the question if state rates were not enough higher to make up the difference in the expense, and that is in response to that and it is directly cross-examination.

Mr. HILL: This is a comparative table that Mr. Perkins admitted very little traffic moved under.

The MASTER: Go on.

A. It shows generally that the rates on these commodities between points in Arkansas are lower than on the same commodities between points in other states than on the comparisons used for interstate.

Q. Mr. Lincoln, don't the commodities that are listed on that exhibit constitute a large volume of business?

2421 A. Well, brick is a large movement and usually goes under commodity tariffs and not distance tariffs.

Coal is a large movement and interstate moves under commodity tariffs and not distance tariffs.

There is a very large movement of cement, nearly all of which moves on commodity rates.

Cord wood I have no information on.

Grain, ordinarily does not move on distance tariff, but on commodity or transit rates.

Hay moves more nearly on the distance tariff, state business usually on distance tariff.

Lumber ordinarily moves on commodity rates.

Salt moves on commodity rates.

Sand moves on commodity rates.

Stone ordinarily moves on commodity rates.

The comparisons are not those upon which you can very well base a conclusion, as to the interstate or even as to the state rates in other points, except as a paper proposition.

Q. That does show the rates on those commodities in the state for short distance and about the average of state haul and also for the interstate movement on short corresponding hauls.

A. No, Judge—I have no doubt that the statement is correct, absolutely none.

That these are based upon the distance tariffs of the re-

2422 spective states I have no doubt that such is the fact as to many of these commodities, in fact all of them, the rates generally in Arkansas are lower than the other states. As to the

computation upon which the interstate rates are made I do not know anything about that.

Q. Assuming it is true and correct on the face of it, it shows that for the same distance the state rate is lower than on the interstate on those commodities that are set out here?

A. If the statement is correct and the business moves under those rates, yes, sir.

Q. Taking that generally and in the aggregate, does that not represent a large movement?

A. The commodities represented by the statement represent a large movement of the traffic.

Q. Mr. Lincoln, are you familiar with the ruling of the interstate commerce commission under which they take the sum of the locals of the different states as prima facie evidence of the interstate rate?

A. I am very familiar with the ruling. They hold a through rate should not exceed the combination of locals and where a through rate does exceed those they will hold prima facie that the through rate is unreasonable.

Q. That shows that they recognize the relation between the state and interstate rates, does it not? Is not the effect of that to
2423 establish kind of a parity between that part of the interstate rate as applies in each state with the state rate?

A. From my knowledge and information, the way that question arose was as to through rates in cases of combinations on terminal points and relate- to interstate business rating. I never construed it or considered it as setting up any connection with state rates.

Q. Is it not obvious on the face of it a recognition that there ought to be equitably and in justice, a relation between the interstate rate and the state rate? That is to say, the return of an interstate rate which exceeds the sum of the state rates is unreasonable within itself?

A. Where the combination of two rates are lower than the through rate they point out that that seems to be an unreasonable rate.

Q. That is in itself a recognition to some extent of the relation, that there should be a relation in the adjustment of the two classes of rates.

A. No, I do not think so. I only had it in mind as the measure for——

Q. Does not that take as a prime facie the state rates as a measure for the reasonableness of the interstate rate?

A. If the state rate happens to be on two movements to make up the through movement——

Q. That is what I mean.

A. —they do that as to state and interstate. It is a com-
2424 bination of two interstate rates, or a combination of interstate and state rate, as compared with the through rate.

Q. Is it not a fact, Mr. Lincoln, that state freights are as a rule loaded lighter in the cars than interstate freights?

A. As to commodities?

Q. As to whatever the contents of the car may be. I will call

your attention to the fact that the evidence in this case is that the average loading of the local car engaged in local service is from three to five tons, I think, and in interstate it is——

A. You are speaking of less than car-load?

Q. Yes.

A. That is the reason I asked whether you referred to commodities or not. The average loading of merchandise in less than car loads is less for the shorter haul than it is for the longer haul.

Q. That in effect results in the impairment of the efficiency of the cars that engage in local traffic, does it not, and therefore a corresponding increase in the——

A. Yes, all the traffic derived from that is not as great.

Q. Well, railroad operators seek, as a matter of economy, to adjust their business so as to load the cars as nearly as possible to their full capacity?

2425 A. That is the object and a very proper object.

Q. To get the full efficiency of the car service?

A. Yes sir.

Q. Is not that also true of commodities in car loads?

A. As to car load commodities?

Q. Yes. I mean this: taking the entire tonnage hauled by local and through trains, the relative proportion—the percent of the local tonnage moved on local trains, that is, car load—or rather the ratio of the car load tonnage moved on local trains, to the entire car load movement, state and interstate, would not the comparison to which I call your attention——

A. Would not the average loading of a car on an interstate haul be greater than on a state haul?

Q. Yes.

A. I think it would be some greater, the average loading on interstate than the state haul, because the interstate haul very largely represents business moving from manufacturers to jobbers—that is, as to merchandise; but as to commodities, such as lumber, grain and articles of that kind, I really see very little difference in the loading. I will say that as to grain my experience is that loading grain is just as heavy on the short as on the long haul movement—from St. Louis.

Q. Do you know how it is done in Arkansas?

2426 A. I will apprehend that the average car loading outbound in Arkansas will be probably lower than the inbound movement, state or interstate.

Q. It is a fact that all railroad men recognize that in these heavy grain trains from the Northwest down into that territory the cars are loaded to the full capacity?

A. That is the accepted basis now.

Q. You are aware that for instance if a local man at Little Rock in loading his car out to his customers he will perhaps load one car to a dozen consignees that represents the same grain that is brought in on the car from Kansas City.

A. No, I hardly think that. I think that he loads out a lighter car than he receives, but not to—the car will come in first, probably

from the country—into Little Rock with 60,000 pounds of grain in it, and it may contain only 40,000 going out.

Q. Now there is another case of where the efficiency of the car is lost to a large extent, say one-third.

A. Yes, but that is an interstate movement.

Q. Whatever you term it.

A. Yes, but it is an interstate movement; it is not a local movement.

Q. What is the proportion of empty car movement on local and through trains?

A. I could not answer that now. I have not been in the
2427 railway service for four years and I am not informed on that.

Q. Mr. Lincoln, you stated in your examination in chief that one of the principal factors in rate making was the maximum rate allowed by law:

That grows to some extent, does it not, out of the low rates prescribed by state commissions?

A. Well, answering the last part of your question first, I will not say whether the state rates were too high, or too low, but the maximum rates fixed in the state become the measure from which rates would be made and under *to* ordinary conditions will not be made lower unless there are commercial or competitive conditions requiring them to be made lower.

Q. You are speaking of interstate rates in relation as to state rates?

A. As to state rates. Now, as to an interstate shipment, you take the combination of the two state rates and you add them together. I am speaking of your system in the West more generally of state rates and interstate rates.

Q. In that sense if you say the law fixes the maximum for interstate as well as state——

A. In that sense because we cannot very well charge more for the through shipment than the two combined locals. Of course, the Commission fixes the maximum rates in its orders; the measure of the rate as to how high but not as to how low.

2428 Q. But the Interstate Commerce Commission in particular instances of complaint——

A. That is all on complaint.

Q. Upon what do you then base your assumption that the maximum interstate rates are fixed by the law?

A. I explained that the maximum interstate rates were fixed by law—that is, the maximum of the interstate rates are fixed by the law, because we cannot exceed those two component parts. Of course, Judge Moore, our present system of interstate rates has been one of evolution. It was not established today or yesterday, or twenty years ago. It was established a great many years ago.

Now, they have been controlled either by a maximum scale rate, or by competitive conditions, or by commercial conditions.

For example, the rates from St. Louis to what is known as trans-Missouri territory—Kansas and Nebraska is the trans-Missouri territory—when the Nebraska Legislature reduced its rates in the

State of Nebraska it reduced the rates from Omaha and immediately that reduced the interstate rates from Chicago and St. Louis so as not to exceed the combination, the rates having been made upon the old combination, generally speaking.

The same was true as to Kansas. When the rates in Kansas were reduced it then reduced the interstate rates by reason of the
2429 combination through Kansas City—although some of the rates were made lower than the combination—but by reason of the reduction in Kansas there was another readjustment.

The rates into Arkansas from interstate points were really affected by your Arkansas tariff. Rates from Bridge Junction to Little Rock that fixed the rates you might say from Memphis to Little Rock.

Then there were commercial conditions that required certain other adjustments from New Orleans—the rate from St. Louis to Little Rock and I think Ft. Smith. I have been out of the service four years and I am not entirely familiar with that, but I think the Ft. Smith and Van Buren rates are made with respect to the Little Rock rate, so if the Little Rock rate was disturbed by that factor it disturbed the interstate rate.

That is why I say you aim to get all you can. Every traffic man does that. I do not mean by saying that, that he will stifle business at all. He must have in mind the movement of business and the commercial necessities of the community he goes through. If he put the rates too high he might as well not have a railroad at all but the measure of our rates necessarily has some local obligation as a maximum.

Q. Now then as I understand you, the rule is what you have stated, that is to say as to the maximum rates, and that rule is determined how in those exceptional cases brought about
2430 by competitive and commercial conditions?

A. They have been brought about by competitive and commercial conditions——

Q. And they are treated as exceptions to the rule?

A. They are all exceptions to the rule and I would say that generally, as to interstate traffic, you do make an exception to the rule because of the force of competition as between communities.

Q. That is forced upon the railroad operators, is it not?

A. The competition forces the adjustment.

Q. Those exceptions are forced upon them by conditions the railroads cannot control, are they not?

A. Generally speaking, they cannot control them.

Q. For instance, you take the common points where the shorter line controls the rate: that is something that cannot be obviated, can it?

A. No, I do not see how we can obviate the short line controlling rate, although it don't always——

Q. It does in the absence of some other exceptional condition?

A. No, where it is based upon the statute rate of course the short line controls the rate, but there are so many other conditions going into rate making that the short line does not always control.

Q. Give me an instance where the short line common
2431 point does not control.

A. There are so many of them that it is very hard to determine. I will give you one. It is based on a contract.

The Chicago Great Western Rialroad is notoriously a long line from Kansas City to Chicago and yet it made the packing house product rate for the short line because it established a lower rate.

Q. By reason of contract?

A. They made a contract to get the business, by which they would enjoy a certain share of the business; not the entire business, but a certain percentage of the business.

There are innumerable instances of that kind where a long line may originate the lower rate between two competitive points.

Q. Is there any such case in Arkansas?

A. There are. Just as the shippers' traffic men may convince him (the railroad man) he can get some business.

Q. Can you give me any instances you have in mind now, in Arkansas?

A. No, I couldn't give any instances. I presume it would be very easy to determine from the records of the rates from St. Louis to Ft. Smith and Van Buren. If the Iron Mountain originated a rate, they created a condition. They are a long line and the Frisco is a short line.

Q. That is hypothetical, you do not know of such a case?

A. No, but I say that we know those things are done
2432 and contsantly done.

Q. Mr. Lincoln, I want to be informed on another matter and that is as to the extent to which distance, the mileage scale, is displaced by these exceptional conditions where they arise:

For instance, take a movement from St. Louis to Memphis or New Orleans: those points are both dominated, as I understood, as the exceptional condition—the rates from St. Louis to Memphis and St. Louis to New Orleans.

Is the distance scale of adjustment of rates abandoned there, or is it still kept in force as far as it can be operated?

A. The distance rate is entirely abandoned in the making of rates from St. Louis to Memphis and New Orleans.

Q. What is the rate to Memphis, Mr. Lincoln, from here to Memphis?

A. I cannot state positively. I think it is 7 cents, but I would not say; first class. It is 90 cents to New Orleans.

Q. It seems to me that that establishes just the contrary to what you say, begging your pardon.

A. St. Louis rates are not made on distance tariff, but on water competition.

Q. I asked you if the mileage scale is lost sight of or if it obtains in making rates between nearer-by and more distant points.

2433 A. The mileage scale is absolutely lost sight of in making rates.

Q. Perhaps in using the word "scale" I have run upon some

technicality. I will leave that out and put it in a more homely way:

How are the rates adjusted from St. Louis and Little Rock, as compared with the adjustment to Benton, Malvern and Arkadelphia, three points on the main line below Little Rock—how are they graduated?

A. I have not studied those rates lately, but I was of the impression that the rates were made to points South of Little Rock by adding the rates out of Little Rock to the Little Rock rate.

Q. In that case length of haul controls?

A. The length of haul South of Little Rock and the measure of rates control that.

Q. Take a shipment from St. Louis to Memphis, which you said on first class was at the rate of 70 cents and to New Orleans a rate of 90 cents——

A. I think those are the figures.

Q. Why is the rate 20 cents higher to New Orleans than it is to Memphis?

A. The rates made from St. Louis to New Orleans and to Memphis are made as against water competition. I presume they could get more money to New Orleans than they could to Memphis. They had boats running in the old days—they do not have them
2434 now—from St. Louis to Memphis. We also had boats which operated through St. Louis to New Orleans.

Q. Is it not a fact that the distance from St. Louis to those two places is a factor in fixing those two rates?

A. I do not think so at all because intermediate rates this side of New Orleans are higher than they are to New Orleans.

Q. What is the intermediate rate to Jackson and Meridian, as compared with Memphis?

A. I do not recall, but it is higher than from St. Louis to New Orleans, the rate from St. Louis to Jackson and Meridian, although the traffic moves through Jackson and Meridian to get to New Orleans.

Q. That establishes the proposition that this disturbance produced by these exceptional conditions is confined to the point where the exceptional condition exists, and does not affect the intermediate rates.

A. I say there was a commercial or competitive condition that required a departure from the mileage scale.

Q. As to New Orleans?

A. Yes, sir.

Q. But does not affect the intermediate points like Jackson and Meridian?

A. Not to the same extent; to some extent, but not to the same extent.

Q. But still the fact remains, Mr. Lincoln, that the rate
2435 to Memphis, the shorter distance, is less than the rate to New Orleans from St. Louis?

A. I may be wrong. It may be that the 90 cent rate may apply to Memphis and New Orleans.

Q. It is in testimony here that you are right about that—I won't say the exact cents, but the rate is higher to New Orleans.

How is it with reference to river points? To illustrate: a shipment by boat to New Orleans—Memphis is an intermediate point with reference to distance between St. Louis and New Orleans—how are the boat rates adjusted as between those two points, from St. Louis to New Orleans, and St. Louis to Memphis? Is it in regard to the distance?

A. I stated that I imagined that the making of the scale rates from St. Louis to Memphis lower by water than the scale from St. Louis to New Orleans, is probably due to the fact that there are certain boat lines operating from St. Louis to Memphis, that being their destination; whereas there are certain other boat lines which operated through from St. Louis to New Orleans; they, of course, could get more money into the lower river by not having the Memphis boat competition, but whether the boat from St. Louis to Memphis stopped there and made the measure of the rate or not, I don't know.

Of course you understand we have no boats from St. Louis to New Orleans and no rates.

Q. But the potentiality of the river is what affects rail-
2436 road rates, is it not?

A. When the competition exists it affects the railroad rates.

Q. The fact remains though, does it not, Mr. Lincoln, that the river rates are lower from St. Louis to Memphis than from St. Louis to New Orleans?

A. That is my impression. I would not want to make a positive statement upon that point at this time without consulting the tariffs as far as that is concerned. That is railroad rate you are speaking of?

Q. River rate.

A. There are no rates by river to New Orleans now. We have no river rates.

Q. I was just going to ask the question if that did not apply to rail rates.

A. The rail rates are the measure of the old river rates. At the present time we have no river rates to New Orleans.

Q. That is what influences and renders them the exception to the general rule you spoke of awhile ago?

A. The water competition made those exceptions to the general rule.

Q. Now, Mr. Lincoln, pursuing the matter a little further—and I am speaking now with my impression of what the testimony in this case is—is it not a fact that it must be a very exceptional condition that would bring about a lower rate for the long haul than would be fixed upon an intermediate shorter haul?

2437 A. It requires an exceptional condition. Some force of competition that fixes the lower rate for the longer haul to the terminal point, but as to the rates to the intermediate points that is something which we could debate at great length.

Q. Mr. Loncoln, I believe the rates from St. Louis to Eastern Arkansas are affected by the Memphis rates, are they not?

A. From St. Louis to points in Eastern Arkansas?

Q. Say Brinkley and Paragould.

A. I believe they were by rates from Memphis over to those points.

Q. Do you know how the rates from St. Louis to Paragould, which is perhaps forty, fifty, or one hundred miles closer to St. Louis, and Brinkley compare.

A. I do not. I don't recall. I should judge that so far as merchandise is concerned, you are speaking of class rates—I haven't had occasion to examine the tariffs for some time and I have had no opportunity to prepare myself with any figures in this case. I can ordinarily tell as to the grain adjustment, but not as to general merchandise rates, and in speaking as to an Arkansas adjustment I can only speak as to what has been the usual controlling factor in making the rate, not as to the exact measure.

Q. Mr. Lincoln, when you say in regard to the cost of service being the large factor in determining the rates, you mean
2438 in determining the details, don't you? You do not mean that a railroad could operate unless it could fix its rates with some reference to the cost of the service?

A. I say that the cost of the service is not the factor that controls the making of the rates. The results of operation necessarily, as to the revenue, you would have to have some regard to cost or you would go into the hands of a receiver.

Q. That is what I want to know.

Could a railroad be operated successfully if its rates were fixed without any reference to the cost of the service it rendered to the public?

A. If it absolutely disregarded it and handled its business without regard to cost of the service, it would either have to get a receiver or raise the rates.

Q. When you speak of the disregard of the cost you mean in fixing particular rates?

A. Yes, the particular rates, though, do not take into consideration to any great extent the cost——

Q. But you would not say that railroads are not governed by the same rules that all other industrial institutions are governed by, would you?

A. I say if they do not govern themselves by the same rule, they ought to.

Q. Are they not governed by the general and universal
2439 law which is necessary in manufacturing or industrial concerns, to so fix their prices that they would not be under the cost of production.

A. It should.

Q. Would not a railroad that disregarded it, be in the hands of a receiver?

A. Well, it has not done it.

Q. Are you familiar with the ratings of the Western Classification Committee?

A. Yes sir.

Q. Do you know the classification they make for the various commodities moved?

A. They divided them into ten classes.

Q. Do they have any regard or pay an attention to the character of the articles transported with reference to the cost and the risk that enters into the service in reference to the particular classes that are defined by them?

A. They consider a great many things in the development of the proper rating to be applied. The cost, the risk, the density and the volume of the traffic.

Q. They take all of those things into consideration, do they?

A. They do; by intuition, if not directly.

Q. Why is it that they would classify an article of small value and little density, weight, etc. lower than they would an article of greater value, that did not have so much density and was
2440 lighter.

A. To distribute the proportion so as to make the commodity as nearly as possible contribute its share toward the total revenue of the road.

Q. And they have in mind the cost of handling those different classes of commodities?

A. Those are all factors that should be taken into consideration.

Q. Does not this Committee do that?

A. Very largely.

Q. Does not the classification on its face show that?

A. As a whole it shows very good judgment.

Q. Take an article that is very valuable and fragile, easily broken, that would involve a heavy loss and damage claim: they are likely to put a higher classification on that than on one that is less likely to be broken?

A. The classification is the best prepared document of the relations that should exist between the different commodities. The classification shows the relations that should exist, not the rates.

Q. Mr. Lincoln, you stated that statistics of all kinds are kept by the railroads, and I remember you enumerated among those various commodities handled, the total of the tonnage, and that sort of thing: what are those statistics kept for?

2441 A. Well, they are kept for an index as to the business handled by your railroad—the operating sheets, cost of service, cost of handling business over certain divisions. The empty car movement is supposed to influence a man as to where he ought to get the tonnage instead of hauling back empty cars; for the guidance of the traffic man in the conduct of the traffic department.

Q. All those elements which you enumerate now enter into and influence the keeping of those statistics?

A. They should be used for that purpose.

Q. They also keep statistics in the same connection——

A. Of course, the commodity description is now kept in making reports to the Government.

A. In connection with those fiscal statistics they keep revenue statistics showing what the earnings are?

A. Oh yes, there is such a statement as shows the earnings of each station. I suppose about one traffic man in one hundred sees it. There are all kinds of statistics and they are very valuable, very valuable.

Q. One other important reason, I imagine, for all that is to enable the railroads to know how successful their operations are financially, is not that one of the reasons?

A. I think that is the necessity for statistical work; otherwise it would be impossible to know what your operation shows.

Q. That is the reason, or one of the causes, for keeping
2442 those statistics, to ascertain the cost relatively of handling certain commodities?

A. Yes, that is what it is for.

Redirect examination.

By Mr. HILL:

Q. Mr. Moore has inquired of you about the extra cost of handling less than car load movement: there is a higher rate for that, is there not, on the less than car load than the car load?

A. Oh yes; the rates are higher on less than car load business generally, with very few exceptions.

Q. That is for the purpose of taking care of this extra cost that you have spoken of?

A. Yes, sir.

Q. That would enter into these statistics I have given you, in round figures, twelve mills on interstate and six mills on state?

A. If you take the earnings into account it has got to show results.

Q. You told Mr. Moore that there are fluctuations in the movements of commodities that would change the revenue as well as the change of rate would change the revenue.

A. The average rate.

Q. Is not that equally true of commodities, state and interstate?

2443 A. Of all business, state or interstate.

Q. Is it not a fact that they move practically hand in hand, the same class of commodities on the same trains, as a general proposition?

A. State and interstate?

Q. Yes.

A. Yes, grain moves at the same time, local and interstate; lumber——

Q. These fluctuations that he refers to occur in one line of the traffic as well as in other lines of the traffic?

A. It will make its appearance in both state and interstate business.

Q. Speaking of the Western Classification of commodities as the basis of fixing rates: do not the railroads in the interstate tariff make many exceptions to that?

A. A great many, state and interstate.

Q. Both state and interstate? The State Commissions make exceptions and the railroads make exceptions?

A. Yes, sir.

Q. Mr. Moore has asked about a great many rates which he has called "exceptional" rates, like these New Orleans competitive rates; zone rates and things of that kind that are excepted from the distance scale:

I will ask you, as a general proposition, whether the traffic most largely moves under these competitive rates or does it move under the distance rates?

2444 A. It moves under the competitive rates.

Q. They constitute the larger volume, these rates Mr. Moore has been discussing with you, as based on competition conditions, river conditions and things of that kind?

A. A larger volume moves under competitive rates.

Q. Now, in referring to the rule of the interstate Commerce Commission that a through rate in excess of the sum of the locals is prima facie unreasonable, is not that founded upon the principle that you announced in your direct examination, that the rate making bodies, whether the state or the railroads themselves, make proportionately lower rates for the long haul than they do for the short, and if you have two short hauls they are supposed to be more expensive and must have more remuneration; it necessarily would follow that a rate for a long haul including that would be less; is not that about the principle of it?

A. The theory of rate making is that the long haul should be not as great a rate as the short hauls combined, and the commission in making their ruling—and I presume I had as much to do with that issue before the Commission as any one else—held that prima facie any combination of two local rates which are used by the railroads are lower than the through rate then the through rate is excessive. They did not, however, make any order that the through rate should be lower than the combination.

Q. You are referring to extra expense of the short haul business: would there be any expense other than on train and station

2445 cost?

A. The greater expense attached to the short hauls as compared to longer hauls are on local trains as compared with through trains?

Q. Yes.

A. The train expenses and the station expenses, the wear and tear.

Q. Now take the traffic expenses: there is no extra cost of traffic expense in regard to the length of the haul, is there, in the difference in the haul, state or interstate; long or short, or local and through?

A. The only feature that was brought out in station expense was that in the short hauls there were more broken shipments requiring more billing. That is station expense.

Q. That is station expense. Take traffic expense: would there be any extra charge on that?

A. I don't know how you use the term.

Q. I think that includes these outside agencies and industrial agents; I don't know how many other things. They are classified in that way—soliciting agents, traffic managers and freight agents, things of that kind: would there be any additional expense due to that?

A. In handling local business they don't need the expense of solicitation, outside agencies, that they do in connection with the competition business.

Q. That would be borne more largely by the competition
2446 business than it would by the local business?

A. Oh, if you get down to the exact science of cost, why yes, but that has not been found, any way to get to the science of the cost.

Q. Take your terminal expense on the through business: Mr. Moore asked you about terminal expense on trans-state shipments: are they not handled about every one hundred miles in division points?

A. One hundred to one hundred twenty five miles, approximately that.

Q. The train is usually broken up in places like Little Rock and a new train made up?

A. Oh yes at division points, especially important division points, or a junction point.

Q. Speaking of less than car load shipments which you have explained at some length, being more expensive to handle for way billing and other matters, I call your attention to the cotton movement in Arkansas: that is a very considerable volume of traffic, is it not?

A. Yes, the Arkansas traffic is very large.

Q. Do you remember how that is handled; do you know the detail of it?

A. It is local into the compress point, compressed and subsequently reshipped.

Q. All interstate, is it not?

A. All treated as interstate movement, through inter-
2447 state.

Q. The movement into the compress is usually less than car load, is it not?

A. Largely less than car load movement, yes.

Q. They usually pick up the cotton as they get to the stations, and take it to the nearest compress point as a less than car load, and then it becomes a carload when it leaves the compress?

A. In any quantity.

Q. That would have three terminal expenses, would it not?

A. That particular traffic would, yes, sir.

Q. Well grain would have three, too, would it not?

A. Most of the grain has three; the majority of it.

Q. I believe you have already explained those. Practically all of the grain is in the interstate movement?

A. Practically all handled on transit, would therefore be interstate movement.

Q. Summing up all these various items of extra cost which you

have gone into, are they the items of extra cost you had in mind when you made your original statement that you thought the revenue being double on the state traffic over the interstate traffic, took care of these extra expenses that you have been referring to?

A. I had in mind that the extra expenses of handling the short haul were taken care of by the rates which reflected the revenue.

2448 Recross-examination.

By Mr. MOORE:

Q. What do you mean by less than carload shipments of cotton for the purpose of taking it to the concentrating points?

A. Most of the cotton handled in Arkansas—I don't think the condition has changed, if it has I may be wrong in my statement—is handled on through rates from points of production to destination. Cotton is handled on local movements into the compress point on local rates in any quantity.

Q. You stated that a good deal of that was less than carload?

A. Yes, in less than carload lots.

Q. I would like you to explain what you mean by that.

A. Not solid carloads from point of shipment into the compress.

Q. Is it not the practice down there in that respect, that a car would be side tracked, loaded with cotton at the commercial centers where the cotton is collected from the farmer and then hauled in in carloads to the point of concentration; is that not the common practice?

A. It is taken into the local points along the line, placed on the platform and shipped into the compress point.

Q. Take the history of a loaded car: is that stopped and loaded until the capacity of the car is exhausted, from station to
2449 station, or does it usually start from the point of shipment with a full car?

A. I think not as a solid car. I don't think the movement into the compress point is full carload movements.

Q. What is your means of knowledge in regard to that?

A. Matters that came to my knowledge and information of eight or nine years ago, when I had charge of that business. We could not load our cars into the compress points full. We could not hold the cotton indefinitely at the local stations until it accumulated a carload.

Q. My information is that these cars are set out at the stations at which they are loaded, and as a rule—of course, there may be exceptions to it, but as a rule the car goes out of the station where it originates, loaded to its capacity: that is what I am talking about.

A. That was not the situation eight or nine years ago. It was the effort all the time to get them loaded full.

Q. You spoke a moment ago of terminal expenses in connection with trans-state cars: is not that rather a yard expense instead of the terminal?

A. That is a yard expense.

Q. There is a difference between terminal and yard expense? Is there not?

A. I don't think there is a great deal of difference between that in the handling of interstate or trans-state carload business, because it is simply a switching service. Now, that expense is smaller
2450 at some division points than at other division points. Take a division point like Little Rock: trains have to be broken up more there than at Poplar Bluff, or Hoxie—I think that is the division point now. There is more breaking of trains at Kansas City than at Sedalia.

Q. What would be done at Hoxie, for instance, I mean in the trans-state?

A. With a through train going to Hoxie?

Q. Yes, going to Texas?

A. Well, a through train starting from St. Louis to Texas pulls out of here as a solid train, we will say, to Hoxie. There the crew taking it releases that train. There is a new engine and a new crew to take it out. That train is broken up to some extent at Hoxie in order to take care of the through freight which may accumulate and go in that train and set out some that is not time freight.

Q. Please explain that.

A. There are three classes of freight in the train, red ball, green ball, and the third class on which the time does not cut a figure. When they break up at Hoxie they will put in red ball there and take out some unclassified freight.

I stated that at a point like Hoxie the service of breaking up the train and switching will not be as great as a point like Little Rock. There they will probably have to break the train up very
2451 largely because the contents of that train out of St. Louis to Little Rock is distributed over other divisions. It is not all going to Texas, but some may go to Fort Smith or Monroe or Shreveport, or Pine Bluff; so it requires the breaking up of that train and the making up of a new train at Little Rock.

Q. Let me see if I understand you: at Hoxie there was a car that was not to go on: with that the work would be to set that car off?

A. I would say that if you start the train out of St. Louis to Hoxie, and Hoxie will have cars coming in there from Cairo and from Thebes. Trains break at Hoxie.

Now, if there was some red ball freight, the time freight, in the trains out of Thebes and Cairo, it would be put in the train going south from Hoxie.

Q. Assume that that is trans-state tonnage.

A. Yes, trans-state, all of that is, or interstate tonnage, not necessarily trans-state,—Poplar Bluff or Texarkana or El Dorado.

Now they take out of that train the slow freight and put in the red ball so as to have that train take care of the red ball south of Hoxie. There would not be very much changing of the contents of that train at Hoxie, but there would be at Little Rock and there would be at Kansas City.

Q. If there were five cars on that train going to Texas, when it reached Hoxie,—I mean in its original condition as it left
2452 St. Louis—there are two cars that come in from Cairo which you want to put into that train to take to Texas, you simply hook those two cars on to the through train to Texas?

A. That is hardly the situation. I will try and explain a little better than I have.

We will assume—I don't know what the tonnage is of the engine that takes that train out of St. Louis to Hoxie—that is one division, there is a division in between—that the engine is rated to carry 1500 tons:

It has in the train 700 tons of red ball. It has in the train five hundred tons of green ball, that is 1200 tons.

Q. What is green ball?

A. That is next to the preferred freight. Green ball comes next to red ball.

Then it has in the train 300 tons unclassified freight on which time is not an object. Now, it arrives at Hoxie. These trains that came in from Cairo and Thebes have red ball freight in them. They will take out at Hoxie—by the way, Hoxie is on the main line, no branches there—in the train that carries 1500 tons there at Hoxie, they take out at Hoxie green ball freight—or they first take out the non-classified, the slow freight, and if necessary take out of it some of the green ball freight and put in the red ball, the time freight, to expedite the movement of that freight through.

2453 Q. They take out the unclassified freight?

A. Yes, first.

Q. And put in the higher grade for the purpose of giving the latter the benefit of the quicker movement?

A. That is predicated on the power in and out being the same.

Q. I understand. What do they do with the train when they have hooked on that additional green ball?

A. When they make up their tonnage for the train south of Hoxie that has to go on and what is left——

Q. The train goes right along?

A. Another train.

Q. What do they do with the unclassified traffic that is on there?

A. Leave it there to fill out the next train or carry it forward on a local train; or they may accumulate sufficient freight by reason of three divisions to take care of that and run an extra train; or, they may be able to handle on the train south of Hoxie if there are a greater number of tons to the engine than into Hoxie.

Q. That is yard service?

A. Switching and yard.

Q. For the purpose of expediting the more important freight with reference to the movement?

A. Yes, sir.

Q. And it consists in taking out of a train certain freight

2454 and putting in certain freight which cannot be delayed?

A. It requires a switching service, yes.

Q. Now, we will go to Little Rock: what do they do at Little Rock, tell me in detail.

A. The train going into there would be broken. It would be broken to a greater extent than at Hoxie because of the various branches—suppose there is a carload each going to Camden, Hope, Texarkana, Fort Smith or Galveston, or maybe to Pine Bluff: now there are three lines branching out there. If the red ball freight

is going in different directions that requires another breaking up of that train.

Q. That is, provided it contains cars that go on these different routes?

A. Solid cars of the same kind of freight moving direct from St. Louis to final destination——

Q. If you have two cars on that train going to Monroe, Louisiana, would you take that off and put them so they would go on the valley lines?

A. Yes, sir.

Q. That left you ten cars going to Dallas and there are five more cars there going to same destination or some point beyond there, but on the same road, they would be hooked on to the train?

A. The train is all broken up. It is not just a question of taking the engine off.

Q. What service is performed in doing that work?

2455 A. Switching, throwing it on the different tracks; they have there classified yards, I presume. They have splendid yards at Little Rock, I think it is the ladder style, throwing the cars on to different tracks to be made up in trains.

Q. That illustrates the service that is rendered in connection with the handling of cars?

A. Yes, sir.

Q. Now, let us assume that there are five cars on that train at Little Rock, tonnage for Little Rock:

One has to be delivered, we will say, to a plant in Little Rock; another to an industry south of Little Rock—the Davison brick yard, and another one to another point in Little Rock: what is the service rendered in reference to that tonnage on that train?

A. I would not undertake to state in detail the final operation at Little Rock. I know in a general way what it is because *because* I have been over similar yards in Kansas City a great deal.

They take those five cars there, they are set out on a track designed for switching cars from and to the local industries and the engine would take those cars and switch them to the different industries.

Q. When they are unloaded they are brought back empty to some other point?

A. Probably.

2456 Q. There is a terminal service in addition to the switching service that is applied to the trans-state cars, is there not? There has to be an additional terminal service in connection with those cars which are to be——

A. There is a greater measure, of course, in the switching. The cars have to be switched from the tracks to the train and some have to be switched from the tracks to the different deliveries. Those deliveries are a greater distance apart.

2457 Mr. MOORE: Mr. Lincoln, does this transstate traffic that you have been speaking of require the use of the station organization at points where the re-adjustment you spoke of is made?

A. Generally speaking, no.

Q. Or the station buildings?

A. No.

Q. Does it require the use of the house tracks for cars, loading or unloading?

A. It should not; I presume it does not.

Q. Or public tracks?

A. It should not.

Q. It does not require, does it, the use of tracks to elevators? It does not require the use of the tracks to elevators and industries? You have already spoken of industries I think?

A. It does not require the use of the elevators.

Q. Of tracks to elevators?

A. It does not.

Q. The office of this adjustment that you described this morning is to enable the train to go on with full tonnage, or a full train; isn't that the purpose of it?

A. Yes.

2458 Q. Now the transstate freight itself, which is passing through the State, does not require that, does it? Just these other trains that are brought in or let out at these places that require switching, isn't it?

A. Well, the train is composed of all kinds of freight.

Q. I understand, but you may have a train of cars, and ten of them would be transstate cars, and ten of them would be interstate cars, or you may want to add some interstate cars, make some changes, such as you describe, at a point on your line, passing through Arkansas. Now you said that that is done for the purpose of keeping up the tonnage of the trains, making a full train?

A. Done for the purpose of getting the most economical result.

Q. That would not be necessary to the movement of this transstate traffic itself, would it, for you to economize on account of these incidents brought into it—by the accumulation of other cars?

A. The necessity of taking in the other class of traffic, of course, is to reduce the cost of operation by using the engine to its full capacity.

Q. To utilize the full efficiency of the engine?

A. The crews and everything to its full efficiency.

Q. And to keep the transstate cars moving as rapidly as they can, is that it?

A. Of all through freight——

2459 Q. Yes, that is what I mean.

A. To keep it moving as rapidly as possible.

Q. Is every through train, transstate freight train, that goes across the state subject to that adjustment that you spoke of?

A. Of changing the contents of the train?

Q. Yes.

A. I think practically all of them the contents of the train is changed.

Q. Are you acquainted with the conditions that exist in Arkansas now on the Iron Mountain Railroad as to the route of through shipments from south to north and north to south?

A. I believe I am quite generally familiar with it, not in its absolute detail.

Q. Now do you know the location of the Memphis, Helena & Louisiana branch?

A. Yes, sir.

Q. Does not a great deal of the heavy through lumber business, which originates in territories south of Arkansas, and in Eastern Arkansas also, take that line, which is a low line—it is a low grade line, isn't it?

A. That line from Marianna, or in that vicinity of the M. H. & L. is a low grade line.

2460 Q. Does not the greater part of the transstate movement from Texas points, Eastern Arkansas points and Louisiana points move over that new line, that is, the Memphis, Arkansas & Louisiana by way of McGhee, Lexa and Paragould, crossing the Mississippi River at Thebes?

A. It is my understanding that with the completion of the connecting link between the Helena branch and the M. H. & L., running from a point in the vicinity of Marianna to McGhee, on account of it being a low grade line, the traffic originating or terminating on the M. H. & L., which is the line running from the vicinity of Arkansas City down to Farraday, where it connects with the Texas and Pacific Railroad, and the H. C. A. & N. division from McGhee to Alexandria, where it connects with the Texas and Pacific Railroad is moved by this new line, being the low grade line and the short line; and that business moving between the Mississippi River crossing St. Louis and south, and Louisiana points, including New Orleans, would move over that line, where it would be delivered or received by the Texas and Pacific at Farraday or Alexandria. It is not, however, my understanding that any of the Texas traffic moves by that line, with the possible exception of some traffic in the vicinity of—in extreme southeast Texas. Louisiana and Arkansas traffic having origination and destination north of St. Louis—east of St. Louis, east of the Mississippi River, would move over those rails.

2461 Q. Would not a great deal of that traffic move in unbroken trains, solid trains?

A. I couldn't say as to that.

Q. There is a considerable lumber business originates on the H. C. A. & N. line. To what extent would it move in unbroken trains north?

A. I couldn't say.

Q. How long is it since you severed your connection with this road?

A. Four years ago this month.

Q. Do you know whether or not here have been changes made in the manner of handling transstate traffic since you have severed your connection with that line, growing out of these new lines being established, and also the establishment of the classification yard at Dupo?

A. I can't say as to that definitely. As I have stated, it is my understanding, and it is logical, that the business should move that way; that this business passing between those territories pass over those new lines.

Q. And you are not familiar with those changes growing out of that?

A. Not in the detail of them, no, sir.

Q. Now do you know that the Iron Mountain Railroad has a large classification yard at Dupo?

A. Yes, sir, I know that.

2462 Q. What is the purpose of that, the establishment and maintenance of that yard?

A. Well, I presume the purpose—as it was started when I was with the company—is to take care of their interchange business with the eastern lines through East St. Louis, and also have the yards in which they could make up the trains and handle over Illinois Division, which is a low grade line.

Q. And isn't it a fact, Mr. Lincoln, transstate trains are made up there and classified with a view and for the purpose of giving them the longest possible movement without shifting cars so that traffic can be handled with the greatest economy?

A. That is the purpose.

Q. Any competent railroad operator in handling that class of traffic would do everything that could practically be done to economize by minimizing as much as possible the changing and shifting of cars in those trains, wouldn't they?

A. There and elsewhere. I would state that so far as that line is concerned. I believe it has been open for operation within about the last year, for continuous operation.

Q. Now do you know that in making up that class of trains and classifying the cars the practice now is to put all cars that may require moving, transferring and shifting together at the head of the train so that they can be moved or shifted in few movements?

2463 A. As far as is practicable. That is the instruction, and it is done I presume.

Q. That is done to facilitate the rapid and economical handling of this transstate traffic, is it not?

A. It is to avoid the unnecessary switching.

Q. Now, I believe, if I understood your statement as to the field of your labors, you have been largely with the traffic department, haven't you?

A. Very largely with the traffic department.

Q. Have you had any experience in the operating department?

A. Not directly, excepting for a limited period when I was in the operating department.

Q. When was that?

A. Well, that was about 1879 to 1888 when I was in the operating department.

Q. What line were you with then?

A. St. Joseph and Denver City at that time. It is now the St. Joseph and Grand Island Railway.

Q. What is the length of that line and character of its business?

A. Two hundred and fifty two miles; ran from St. Joseph, Missouri, to Grand Island, Nebraska, where it connected with the Union Pacific Railroad, and was a part of the Union Pacific from 1879.

Q. You have had no experience in handling trains and directing their movements, and in the operating department along
2464 the line of the Iron Mountain since you have been with it, have you?

A. I have had no experience in the matter of handling trains or

directing them. I have only had my experience in consultation with officials.

Q. For instance, now, when you describe the manner in which it is handled at Hoxie, you base it upon general impression and not upon actual experience?

A. So far as Hoxie is concerned upon general impression and upon my knowledge of the instructions that are given. So far as other points are concerned upon actual knowledge.

Q. Well, now, the instructions, I would take it, that are given are always to the end and for the purpose of directing the movement and shifting of cars and traffic with the least possible expense and with the greatest amount of economy possible in the conduct of the traffic, that is true, isn't it?

A. The purpose of the instructions in regard to making up trains, they are classified and all with the end in view of economizing in the operation, and the methods employed unquestionably brought about that result.

Q. You refer now to general instructions from general offices in St. Louis?

A. I am referring to instructions given by the chief of the
2465 operating end through superintendents and yard masters.

Q. Those instructions do not attempt to deal with the details of the operations, do they?

A. Well, the instructions go pretty thoroughly into details, because you have to in giving instructions to minor officers go into details.

Q. I believe you just stated you are not acquainted with the changes made in operating methods since you left the Iron Mountain—on that line I mean?

A. Yes, sir, I am somewhat familiar with them, because my relations are kept up with the railroads, as to their operations, my duties being all railroad duties.

Q. And your duties have been confined to matters pertaining to the traffic in the City of St. Louis, have they not—I mean the city interests of St. Louis?

A. My duties are to look after the traffic interests of St. Louis, and in looking after that interest I have to be generally informed upon the situation caused by competition for other companies.

Q. Your duties do not take you out over the lines of the railroad, do they?

A. Sometimes.

Q. Have you had opportunity, and have you taken occasion, to investigate the handling of this trans-state moving in the last four years?

2466 A. Not in the way you have mentioned, but have been giving a great deal of attention to the handling of trans-state traffic.

Q. That is from a traffic standpoint; have you from an operating standpoint?

A. From an operating standpoint as to cost. It was made necessary in my investigation in the Texas rate case and in the Southwest case.

Q. Now then your investigations have been of the character that

would cause you to go personally on the ground and make a personal investigation?

A. Not in those cases; has been acquired very largely from the reports of the railroads themselves as to results.

Q. Those are reports that contain such general statements, I suppose, as might be expected in official reports?

A. Well, they are very largely reports made for the Interstate Commerce Commission, and the State, and their annual reports.

Q. Speaking of that, what expenses are charged to traffic?

A. What expenses?

Q. What expenses are charged to traffic? You were asked by Judge Hill in your direct examination in regard to traffic expenses; I say what expenses are chargeable to traffic?

2467 A. Oh, I would not undertake to go into that in detail, that is, as to the methods employed by the railroads, in the items of them. It would require a considerable investigation on my part. I have not made it a study, and I do not recall all of the expenses. Charge off certain things not chargeable to traffic; passenger business and express business, various items.

Q. Has the Interstate Commerce Commission promulgated any regulation in regard to it?

A. They have.

Q. You don't recall what they are?

A. I do not recall the detail of their instructions.

Q. I think I understood you to state on your re-examination that a large volume of traffic is under competitive rates?

A. Yes, sir.

Q. Now, Mr. Lincoln, when you made that statement, you had in mind, didn't you, the traffic throughout the country at large?

A. Throughout the country at large.

Q. You were not speaking with reference to the Iron Mountain and the St. Louis Southwestern railroads, were you?

A. Well, I think the general adjustment of rates upon those lines is largely the force of competition.

Q. Now isn't it a fact, Mr. Lincoln, the rates applicable to the heavy movement of traffic on the Iron Mountain and the St. Louis Southwestern lines in the State of Arkansas are graded

2468 according to distance?

A. I am not informed as to the volume of the movements between points in Arkansas; but to my best knowledge and ability, the business which moves between points in Arkansas is moved on distance tariff rates, which is a mileage scale.

Q. Now Mr. Watson testified to that effect in this case. You know who I mean by Mr. Watson?

A. Yes, sir.

Q. Assistant General Freight Agent of the Cotton Belt?

A. Yes, sir.

Q. And that the larger volume of traffic of both of those lines—interstate traffic into Arkansas—was under the rate of distance. You would not undertake to say that statement by him is not correct?

A. Is that the interstate business?

Q. The business into Arkansas, business from St. Louis into Arkansas?

A. That the business from St. Louis to Arkansas moves on Arkansas distance rating?

Q. No, I didn't say that—the Arkansas distance rate is based on the mileage; the rate is adjusted in reference to the distance, and not regardless of the distance of the haul?

A. No, I would not say that the rates from interstate
2469 points into and out of Arkansas—the interstate traffic—was adjusted on a mileage basis, because I do not think it is.

Q. Now we will take the rates on the St. Louis Southwestern, stations on the line of that road, for instance Paragould; will you say that those rates are not based on the length of the haul, I mean now from St. Louis as the initial point?

A. I was going to state that so far as the interstate rates from St. Louis—or the rates from St. Louis, which are interstate rates, to stations on the Cotton Belt Railroad in Arkansas are concerned, they, as I recall it without going into detail, are based: Points south of Pine Bluff upon rates to Pine Bluff plus the Arkansas Distance Tariff. Of course, the rates into Pine Bluff are controlled by the Arkansas State rate, which would be a mileage scale from Memphis; and the rates from other territories are made with relation to that adjustment to a greater or less extent, not to an absolute degree. But so far as the Cotton Belt is concerned, its rates from St. Louis are more nearly upon a mileage basis than any of the other lines in Arkansas.

Q. How is it north of Pine Bluff?

A. North of Pine Bluff I do not recall the adjustment, but the rates do increase to a certain extent as the mileage increases. From the Missouri State line going down to Pine Bluff the rates increase as the mileage increases.

2470 Q. Now what is the condition on the Iron Mountain on its main line south from St. Louis to points in North Arkansas, Central Arkansas and points south of there?

A. As to the Iron Mountain main line?

Q. Yes.

A. Which runs from Little Rock to Texarkana?

Q. Yes, from St. Louis—basing on St. Louis?

A. Its rates are made with reference to the rate into Little Rock, which is controlled by the Arkansas rates from Memphis, indirectly, not absolutely. But to points south, it is made on the Arkansas tariff added to the Little Rock rate. I am not clear in my mind as to the present adjustment. I think the exception to that basis—speaking of the main line—obtains at Hope, Arkansas, and at Texarkana, Arkansas; that I am not positive. Hope may be on the full combination on Little Rock, that I am not sure—not in all rates. Texarkana is not on the full combination in all cases.

Q. You do not undertake to testify then in regard to those?

A. Not as to the detail.

Q. Now, how is it on points on the Camden branch?

A. At points on the Camden branch——

Q. I don't mean at Camden, but take it north and south of Camden?

Q. Points on the Camden branch, it is my understanding
2471 that the present class rates are on the Arkansas Distance Tariff added to the Little Rock rate. As to the details of those figures I would not state. I have not had an opportunity to go into them, and I would not state definitely as to merchandise adjustment.

Mr. MOORE: That is all.

Redirect examination.

By Mr. HILL:

Q. Mr. Lincoln, Mr. Watson testified yesterday to some particular rates to which I want to call your attention. Merchandise rates from St. Louis to Paragould eighty-one cents a hundred, L. C. L.; boots, and the same from St. Louis to Memphis, sixty-five cents a hundred; boots and shoes, St. Louis to Paragould eighty-one cents, and to Memphis sixty-five cents; that would apply to merchandise as well as L. C. L.; packing house products, L. C. L., St. Louis to Paragould fourth class, forty-three cents, to Memphis twenty-six cents per hundred; less than car load lots would be twenty-six cents a hundred to Memphis, and forty-three to Paragould; same proportion as to merchandise; merchandise twenty-six cents to Paragould, twenty-one cents to Memphis. I call your attention to these higher rates to Paragould, and the statement that the traffic passes right through Paragould to Memphis, the rate being higher to Paragould than to Memphis; I will ask you to state what adjustment, if you know, that that is made from?

2472 A. I could not say as to just how the rates obtain at Paragould, as to the measure of the rates, and could only state that—based upon previous knowledge of the situation—that the rates from Paragould are adjusted with reference to the Arkansas General Rate Adjustment; probably based upon rates from the nearest Mississippi River crossings; whereas the rates from St. Louis to Memphis are competitive rates, which probably originated with water competition, to some extent, and to some extent with the competition met with at Memphis from other sources of supply—that is, in their competitive markets. For example, a rate from St. Louis to Memphis might not have been compelled by water competition, but would have been compelled by a rate adjustment from Louisville, a competing market.

Q. Does not that look like it took the rate to Memphis and then charged the Arkansas adjustment from Memphis back to Paragould to the back haul, although they carried the stuff right through—they stopped the Paragould shipment at Paragould and carried the Memphis part of it on through Paragould?

A. I hardly think that Paragould was based on the rate to Memphis and the rate back. I think it is more likely that the rate from Cairo to Paragould was the controlling rate.

Q. Wasn't much mileage consideration in those two rates was there?

A. No, they are not made on mileage consideration com-
2473 pared with Memphis.

Q. We had in evidence here many illustrations, that I will

not go over with you, showing the rate from Little Rock was considerably higher than the rate to New Orleans, with the same commodity from St. Louis; that would not be on a mileage scale by any means, I suppose?

A. The rate is not made upon a mileage to Little Rock as compared with the rate to New Orleans.

Q. Mr. Moore referred to through trains that would have ten cars of transstate, and probably ten other cars would be set out at Little Rock, and asked you, if I understood him correctly, whether this switching or breaking up of a train was not necessary so far as regards the ten cars that were going on through. I will ask you if this switching was not done and other cars hitched onto those ten cars, if that would not make the transstate freight a very expensive proposition?

A. I think I catch the idea is this; if the ten cars of transstate traffic were allowed to go on through as a continuous movement, without putting other cars into that train to bring it up to its tonnage that the engine can haul and the crew can handle, that it increases the expense of handling the transstate freight—undoubtedly.

Q. Well, that would be true if it started from St. Louis that way?

A. Anywhere.

2474 Q. It is economy of the transstate business, as well as general economy, if you break up these trains at these division points or distributing points, as you have indicated has been done?

A. It is economy to all of the traffic handled to make each engine haul full tonnage and not having light trains, whether it is one class of freight or another.

Q. Then it is good economy to set out these through trains at Hoxie or Little Rock, whatever the point, and wait for a train to be made up to carry them?

A. It is economy to wait at a division point and fill out your trains.

Q. In reference to various services performed at the division points, you generally have an inspection? Isn't that a service performed at these division points?

A. Inspection of what?

Q. Inspection of the cars?

A. I assume the cars are inspected at the division points. I hadn't thought of that.

Q. The wheels, boxings, and everything of that kind?

A. That is what is usually done at division points, is to attend to equipment.

Q. That is a cost of service, of course, that would apply——

A. To all.

Q. Apply to all alike?

A. Yes, sir.

2475 Mr. HILL: That is all, Mr. Lincoln.

Mr. MOORE: Nothing further.

# VOLUME II.

No. 813.

ROBERT P. ALLEN et al.
vs.
THE ST. LOUIS, IRON MOUNTAIN & SOUTHERN RAILWAY COMPANY.

2476 R. E. KIMBELL, being recalled by the defendant, further testified as follows:

Redirect examination.

By Mr. HILL:

Q. Mr. Kimbell, are you ready to make your report to the Master that he called for yesterday?

A. I stated yesterday in answer to your request, Judge Hill, that the information could be worked up, but that I disliked to do it on account of the labor involved. I find upon making an estimate of the labor, that it will require something like a month's time for a competent clerk to work the information up. I think it is pertinent to say here now that we have been always willing and ready to work up everything you wanted. In fact, this Exhibit A you put up was worked up at your request, at very heavy expense to us——

The MASTER: Well, never mind about that part of it, Mr. Kimbell. This is contained in the record of the railroad company—the Southwestern?

A. Yes, sir.

The MASTER: Those records are open for all the purposes of this examination, under the order of the Court. I do not think it would be doing justice to the railroad company, or to the witness here, to require him to produce that record. I think, Judge Hill, if you want that information you asked for that you should take the laboring oar and get it.

2477 Mr. HILL: I felt like the laboring oar was on them. They put in half of the proposition; they ought to be required to put in the other half of it.

The MASTER: They really were not required to put in that.

Mr. HILL: They did that voluntarily. I did not ask them to put in that. Mr. Kimbell has been very courteous about furnishing information we have asked. But this exhibit I am calling for now is his own testimony, put in to show certain facts, which he thinks is important, which he admits is one side of it, and when that is done, it seems to me it is his duty to put in the other side of it to get it in full.

The MASTER: I will not require Mr. Kimbell to go into that work.

Mr. HILL: Mr. Moore, I called for this contract yesterday, and I am willing for Mr. Kimbell just to state what it is instead of putting in the paragraphs.

Mr. MOORE: Are you sufficiently familiar to do that, Mr. Kembell?

Mr. KIMBELL: Yes, sir.

Mr. HILL: Now, Mr. Kimbell, without going into the details, I want none of the details, but I want generally speaking the arrangement between the St. Louis-Southwestern and the Iron Mountain as to the leased tracks from Paragould to the Missouri State line?

A. Prior to January——

The MASTER: The record will show that that is done by
2478 contract.

A. Prior to July 1st, 1909, under the terms of this contract, the St. Louis, Iron Mountain and Southern Railway was accorded trackage rights over the rails of the St. Louis-Southwestern Railway between Dexter, Missouri, and Paragould, Arkansas, the compensation being forty cents per train mile. As I have stated, prior to July 1st, 1909, that, in substance, was the entire agreement.

Subsequent to July 1st, 1909, the track was placed on, what is known in railroad parlance, as a joint track basis, which provides for the St. Louis, Iron Mountain & Southern Railway paying the St. Louis-Southwestern a rental on an arbitrary basis and paying its proportion of the expenses of maintenance and operation on the car mile basis.

Mr. HILL: How were the expenses of maintenance and operation apportioned prior to this change?

A. The St. L. S. W. Ry. received compensation at the rate of forty cents per train mile. Under the rules of the Interstate Commerce Commission carriers are required to sub-divide amounts received for trackage of that character between rentals, maintenance, operation and general administration. No fixed basis is prescribed by the Commission, and the railroads are at liberty, under their rules, to divide that amount on such basis as they may consider equitable. The St. Louis-Southwestern Railway credited fifty per cent of this amount to rentals and the balance to maintenance and operation.

2479 Did it make any further apportionment of that fifty per cent from maintenance or construction, or just credit it generally to that?

A. It is credited in proportion a part to maintenance of the way and structures, a part to conducting transportation, a part to general administration.

Q. On what basis is that maintenance of way and maintenance of equipment proportioned?

A. It is a purely arbitrary basis, determined by our company in a way which we think is as fair distribution of it between those accounts as possible. I do not recall just exactly what the percentage is now. I believe it was credited fifteen per cent to maintenance of

way and structures, probably fifteen to conducting transportation and the balance to administration. There is a sub-division there which I do not recall off-hand.

Q. Well, I just want to get at it generally. You sub-divided it into these various amounts according to what you thought would be proper to each?

A. Yes, sir.

Q. Now since you have made this change you have changed that basis also?

A. Yes, sir.

Q. Now how do you apportion it since the change?

A. The amount paid by the Iron Mountain as rentals is
2480 credited to income as a rental receipt. The amount paid by the Iron Mountain for its proportion of maintenance and operation is credited to the several operating accounts in about the same ratio we formerly used it.

Q. I believe you said you ascertained that on a car mile basis?

A. We ascertained the division upon the Iron Mountain and the Cotton Belt, but not the sub-division upon the operating account.

Q. Now the sub-divisions between the operating account you apportioned on what you considered a fair basis?

A. Purely arbitrary.

Q. Between the two railroads it is apportioned on the car mile basis?

A. Yes, sir.

Q. Now, Mr. Kimbell, what traffic is covered by the Iron Mountain Railroad by that leased line in Arkansas?

A. That I could not say, Judge. We have no detail of that traffic whatever. Our record reports——

Q. I am referring to under that contract what traffic may they carry?

A. They are entitled under the contract to carry through traffic only. If, however, in the performance of their duties as a common carrier they are required to handle any local traffic on receiving seventy per cent of the local tariff.

Q. Has that occurred?

2481 A. No, sir, not that I know of, I don't know any single case.

Q. They have handled only through traffic?

A. Yes, sir.

Q. Only through freight traffic?

A. That is all.

Q. No passenger trains?

A. None whatever.

Q. You pay the taxes I believe?

A. We pay the taxes and charge them one-half.

Q. I presume there were taxes taken care of on that just like other taxes?

A. Yes, sir.

Q. No difference in handling the taxes on this leased road to the Iron Mountain than——

A. We pay the taxes. It is our property absolutely; charge them one-half.

Q. When you pay their taxes what do you do with them?

A. That is treated under the itemization as a rental property, just the same as a rental income I assume, not credited to taxes.

Q. And you pay the whole taxes, and as far as the tax account shows you get no credit, but you carry that into another account?

A. Into an income account.

Q. What is the mileage in Arkansas of that line?

2482 A. Thirty-six miles.

Recross examination.

By Mr. MOORE:

Q. When was the change made in the terms of the contract?

A. July 1st, 1909.

Q. Prior to that time were the taxes divided?

A. No, sir.

Q. All paid by the——

A. All paid by the St. Louis-Southwestern. Its compensation was the amount of forty cents a train mile, covered all that was paid by the Iron Mountain.

Q. Expressly excluded any additional charge by the way of taxes or otherwise?

A. Yes, sir.

Q. And that was the condition prior to July 1st, 1909?

A. Yes, sir.

Q. I believe you said only freight cars are moved over this line?

A. By the Iron Mountain.

Q. I mean by the Iron Mountain.

A. That is correct so far.

Q. And this basis of charge applies simply to the freight cars?

A. Yes, sir.

2483 Q. Not to passenger and mail and express?

A. They have the right——

Q. I am speaking about what is actually transported over it?

A. We have not been handling any passenger trains as I know of.

Q. Do not and never have for them?

A. No, sir.

2484 T. F. WHARTON, a witness of lawful age, being duly produced, sworn and examined on the part of the defendant, testified as follows:

Direct examination.

By Mr. HILL:

Q. Please state your name, age, residence and occupation?

A. T. F. Wharton; 40 years of age; residence, St. Louis; occupation, Public Accountant.

Q. What is your business?

A. At the present time I am Manager of the St. Louis office of Haskins & Sells, Certified Public Accountants.

Q. What is the business of Haskins & Sells?

A. It is the business of public accounting, which includes auditing, the preparation and installation of systems of accounts, and all work related to those two classes of business.

Q. Does that firm do railroad accounting?

A. Yes, sir, a great deal of railroad accounting.

Q. Is that a firm that has an extensive business? Explain without going too much into detail, the general nature of the business of Haskins & Sells and where they have offices?

2485 A. The firm of Haskins & Sells have their main office in New York City and have other offices in Chicago, St. Louis, Cleveland, Pittsburg and in London.

Q. How long have you been connected with the firm of Haskins & Sells?

A. Since January 1, 1902.

Q. How long have you been an accountant?

A. Well, I have only practiced the profession of public accounting since that date. Prior to that time I had done more or less municipal work, but no work aside from municipal work to speak of.

Q. What do you mean by municipal work?

A. Municipal accounting matters relating to the municipality and all kinds of municipal work.

Q. Have you been continuously engaged in the business of accounting since 1902?

A. Yes, sir, with the firm of Haskins & Sells.

Q. Have you had any railroad experience as a practical railroad man in any way?

A. No, sir, my only railroad experience has been that secured in the Missouri and Arkansas Rate Cases, aside from just some work that would not amount to anything.

Q. Work has been that of an accountant entirely, so far as it touches these questions?

A. Yes, sir.

Q. You referred to the Missouri Rate Case: what connec-

2486 tion did you have with that?

A. Well, the work undertaken in Missouri was undertaken by the St. Louis office of Haskins & Sells of which I had charge at that time, and I was connected with that case all the way through, although I did not testify in that case or take the close interest that I have in this case.

Q. I wish you would state just generally what the issues were in that Missouri Rate case?

A. The issues in the Missouri Rate case were very similar to those in this case, with this exception:

In Missouri, the Legislature in 1905 and again in 1907 passed a maxmum freight rate law which fixed maximum freight rates on special commodities named in the law.

The railroad companies enjoined the enforcement of that law and it was on their application for permanent injunction that the issue

was raised. The same thing applied to passenger fares also in that case. It was a legislative act fixing the rate at 2 cents a mile. It was also attacked by the railroads and the fight in that particular was the same as in Arkansas.

Q. Were there issues in that case as to the separation of property and business between state and interstate, traffic?

A. Yes, sir, just the same as in the Arkansas case. The question of the state and interstate business and the division of property and expenses between those two classes of business, both freight and passenger.

2487 Q. Did you give that question study, thought and investigation?

A. Yes, sir.

Q. How long were you engaged on the Missouri Rate case, Mr. Wharton?

A. I believe we started our work on that in June, 1906, and we were engaged on that, I believe, for almost three years. I am not sure as to the exact time, but it was something like that.

Q. During that time were you closely in touch with the issues in the case?

A. Yes, sir, all the time.

Q. And you are familiar with the methods of operation and expenses adopted by the railroads and adopted by the state in that case?

A. Yes, sir.

Q. Was your firm employed by the State of Arkansas in this case?

A. Yes, sir.

Q. State the purpose of your employment by the state of Arkansas in this case?

A. The purpose of our employment was to assist the state in getting at the facts in the case as near as possible, in determining the cost of state and interstate business as near as it could be determined.

Q. When did your firm begin to work for the state in

2488 this case?

A. In August, 1908, we were employed by the Traffic Bureau at Little Rock to assist the state in its efforts to resist the granting of the preliminary injunction.

Later we were employed by the state itself to do the work.

Q. By the Railroad Commission acting for the state?

A. Yes, sir.

Q. Do you recall about what time you were employed by the Railroad Commission to undertake this work that you have been continuously engaged in since?

A. I think about last June, May or June, was the time.

Q. Now, Mr. Wharton, begin at that point when you were employed by the state to begin this investigation and state the history and methods pursued by you, giving the reasons for the methods that you did pursue?

A. In our first consultations with the railroad commission and with the counsel for the state we discussed at considerable length the

plans that had been followed in the Missouri Rate Case, and the plans that we thought might be worked out in this case.

The Railroad Commission and its counsel both desired to get at the actual facts, if possible, without the use of any theories of any kind and we went to work with that in view, from the reading of the testimony in the Missouri Case and from——

2489 Mr. MOORE: It does not seem to me that this is competent testimony—the statement of the methods pursued, in the discussions and conferences among the members of this firm Haskins & Sells and the representatives of the state as to the course to be pursued by them in this case.

The MASTER: I suppose the object of that statement is to show the opportunities that the witness has had for acquiring facts and information in this case.

Mr. HILL: Yes, sir.

The MASTER: I will let him go on and state that but not state anything hearsay from the Missouri case in this connection.

Mr. MOORE: I want it to be understood that I am objecting to it.

The MASTER: Certainly, the record will so show.

The WITNESS: From the reading of the testimony in the Missouri case and my understanding of the purport of that testimony, it appeared all the time that the differences in the cost of state and interstate business were mainly the differences in the cost of local and through trains.

The witnesses all seemed to testify that way and we determined that if it was possible we would work up statements showing the cost of local and through business and after getting that cost, we would ascertain in the best manner possible the cost of state and interstate business carried in the two classes of service; in that way getting away from any question of theory, but getting down to an
2490 application of the facts and of the testimony given in that case, and subsequenly given in this case.

Mr. HILL:

Q. How did you proceed to carry out those plans?

A. The first thing that was necessary was to ascertain the movement of freight on local and through trains; also the car miles, engine miles, the train miles, and all such statistics in reference to the movement of freight on local and through trains, in order that the expense could be properly apportioned between the local and the through service and in order that the cost of that service might be apportioned between the state and interstate business moved in the two classes of service.

The Cotton Belt road had prepared statistics of that kind in a test they made in the month of October, 1908.

On the Iron Mountain it was necessary for us to prepare most of our own figures in that particular. The railroad company had prepared a statement showing in full detail the movement of freight during the month of October, 1907, and we——

Mr. HILL: I want to identify that now, Mr. Wharton. It is marked Exhibit 26.

A. We did not work up the entire movement of all freight on all trains during that month but we worked up the movement of all freight on all of the local trains on the Iron Mountain
2491 during that month and having that and the total movement of freight, the difference between the two was the movement on the through trains during that month.

Q. As I understand you, then, you accepted the Iron Mountain figures as to the total movement of the freight during the month of October, 1907, as shown in their Exhibit No. 26?

A. Yes sir.

Q. And started with that as your beginning point and then segregated the two classes of traffic by ascertaining the actual movement on all the local trains in the State of Arkansas during that month, was that it?

A. Yes, sir; that is correct.

Q. Do you mean the Iron Mountain in Arkansas and not the entire system?

A. Yes, sir, the Iron Mountain in Arkansas.

Q. Mr. Wharton, explain the method of working up that, without going into detail. I understand Mr. Hamilton knows that better than you do, but explain the plan and how it was carried out.

A. The detail I am not familiar with.

The plan of the work was to take the wheel reports, list of the car numbers, and get the way-bills, I believe, showing the freight moving in those cars.

Q. You mean from the records of the Iron Mountain Company?

2492 A. Yes, sir, it was all worked up from the records of the Iron Mountain Company.

Q. Just explain what records and where you found that?

A. I would rather have Mr. Hamilton do that. I made up the plan.

Q. That plan was carried out by others, under your general direction and co-operation?

A. Yes, sir.

Q. Now, Mr. Wharton, have you that statement as worked up?

A. Yes, sir.

Q. I wish you would present it and file it as Exhibit "I."

Whereupon the exhibit just referred to is marked "Defendant's Exhibit I" and is in the words and figures as follows to wit:

For Exhibit "I," see Volume 9, page 5787.

2493 Q. Mr. Wharton, please take that Exhibit I and explain it?

A. The first column in Exhibit I, the one marked "local trains" contains the statistics worked up by us under Mr. Hamilton's personal direction. The last column marked "total" contains the total statistics shown in Exhibit 26 and in some of the other exhibits

filed in this case,—I will take the last part of that out—some of these are not shown in the exhibits in the case.

All of the figures in the "total" column were obtained from the books and records of the St. Louis, Iron Mountain and Southern Railway Company, except the percentages and averages worked out.

Q. The totals there of ton miles were taken from Exhibit 26?

A. Yes, sir, from Exhibit 26, the mileage statistics as to car miles, caboose, engine and train miles, were taken from the records of the railway company for that month.

Q. Now proceed with your explanation of it.

A. The second column marked "through trains" is the difference between the column marked "local trains" and the one marked "total," with the exception, of course, of the percentages and averages, which were worked out from the figures in those columns.

The first section of the statement shows the ton miles of freight carried during the month of October, 1907, divided between
2494 local trains and through trains.

Following that we have the ton mileage of each class of freight expressed in percentages.

Following that are mileage statistics and other statistics as to train movement and car movement.

Q. Mr. Wharton, I wish you would state what you found in that test of the loading of the local trains as between state and interstate, expressed in percentages?

A. We found from that that the loading of the local trains was 71.49 per cent interstate, and 28.51 per cent state, based on the ton miles carried.

Q. What was the loading of the through trains?

A. The through trains were loaded 94.41% interstate and 5.59% state.

Q. What did you do with the company freight in that case?

A. We originally worked up some statistics on the company freight but finally excluded them from this statement.

Q. This is the revenue freight?

A. This is simply revenue freight. My recollection of the company freight is that a larger proportion, in proportion to the total freight handled, is handled on local trains than on through trains.

Q. I see you have here "Number of cars handled in and out of terminals where yard engines are maintained:" I wish you would explain those figures?

2495 A. The instructions in relation to working up the cars handled in and out of terminals by local and through trains were that the wheel reports were to be taken and the total cars shown by that wheel report as going into the terminal were to be accounted as going in and the total going out of that terminal was to be accounted as going out. The figures are made up in that way classifying the wheel reports as between local and through.

Q. Now, Mr. Wharton, having obtained statistics as shown on Exhibit I, what was your next step in trying to get at the actual expenses between state and interstate?

A. After having obtained these statistics we worked up the operat-

ing expenses with more or less detail, for the six months ending December 31, 1907, and made a division of those expenses as between local and through train service so far as they are train expenses, and as between intrastate and interstate as far as they——

Q. Where did you get the expenses you were working up?

A. From the books of the railroad company.

Q. Are those expenses shown in your exhibits here?

A. They are shown in detail, I guess, the freight and passenger together,—the detail is shown in one of Mr. Johnson's exhibits.

Q. You started with the details which are represented in these exhibits?

A. Yes, sir.

2496 Q. You had better give me the number of that exhibit.

A. It is statement 4 of Exhibit 3 and shows the total operating expenses in Arkansas, both freight and passenger.

We worked up the freight or passenger side of those expenses, I have forgotten which—the passenger side of those expenses, all the way through and agreed them in total with the total passenger expenses shown on the second page of Exhibit No. 3, where the expenses are divided between freight and passenger business under the heads of "Maintenance of way and Structures;" "Maintenance of Equipment;" "Traffic Expenses;" "Transportation Expenses;" "General Expenses;" "Hire of Equipment;" "Dining Car service;" "Taxes;" and "Rentals."

Our object in working up the details was to make such a separation of that as we thought necessary in dividing the expenses as between local and through service.

Q. That was on the passenger side you have been telling of?

A. We worked the total of the passenger side and subtracted it from the total shown by this statement in order to get the freight side.

Q. What do you mean by "this statement?"

A. Statement 4 of Exhibit 3.

Q. Then how did you proceed with your working up of the freight?

A. You mean the division of freight expenses?

2497 Q. Yes.

A. In answer to that I will file this exhibit as "Exhibit J," which shows the division of operating expenses between local and through train service.

The paper just referred to is marked "Defendant's Exhibit J" and is in the words and figures following to-wit:

For Exhibit "J", see Volume 9, page 5790.

2498 Q. You are referring to the freight?

A. Yes, sir, freight operating expenses divided between local and through train service and state and interstate business.

The methods followed in arriving at the figures shown in that exhibit are explained on these sheets attached to Exhibit J, and which I will file as "Exhibit K." This exhibit consists of eight pages.

The paper last referred to is marked "Defendant's Exhibit K" and is in the words and figures as follows to-wit:

For Exhibit "K," see Volume 9, page 5792.

2499 Q. Mr. Wharton, I do not suppose I can have you explain that any better than you have already explained it in that exhibit?

A. I don't think so.

Q. If there is any detail that is not in that exhibit, that you think of, I would be glad for you to explain it. I think it is as good an explanation as you can make without adding any other statement.

A. It was intended to cover a full explanation of everything going into Exhibit J, freight division of expenses.

Q. I will now take up that exhibit K, Mr. Wharton, and ask you regarding some of the matters you have used there.

I see that under "Maintenance of Way and Structures" you say, "The proportion of these expenses applicable to the freight business, as shown by the statement in this case submitted by the Company, has been divided between local and through train service on the basis of the total engine and car miles of each class, during the month of October, 1907, that month being considered representative of the business for the six months ended Dec. 31, 1907."

Why did you divide that between local and through on the basis of the total engine and car miles?

A. Because it seemed to us to be the most equitable method, and, I believe, is a method followed considerably by the railroads themselves in apportioning that class of expenses where they have

2500 to make a division between different classes of freight service.

Q. Is that regarded in railroad accounting as an accepted approximation of the actual conditions between different classes of service?

A. I am not familiar enough with railroad accounting to say that, but my understanding is that contracts, such as Mr. Kimbell testified about yesterday are on the car mile basis——

Q. Taking it as an accounting proposition, what do you think of it?

A. As an accounting proposition I think it is the best method we could follow with the information we had at hand.

Personally, I think the expenses should be divided on a gross ton mile basis which includes the weight of equipment and the weight of the product hauled, but this is the best information we had at hand to make a division.

Q. You think if you had the information the other way you would get a little closer to the facts, is that it?

A. I believe so.

Q. This is the best method that would most nearly represent the actual facts that were available?

A. Yes, sir.

Q. I see you state that:

"In arriving at the number of engine and car miles we have added 50% to the engine mileage of local trains for station switch-

2501 ing, and have assumed that each engine mile was equivalent to 2½ car miles."

What was your reason for doing that, Mr. Wharton?

A. Well, it appears in this case that the local engines do a great deal of switching and while we had no basis on which to make our 50% estimate, we figured in our own minds that ought to be a liberal estimate as to the mileage made by local engines in station switching. Multiplying by 2½ to get an equivalent in car miles is, I believe, what the railroad men call working it on a wheelage basis, a locomotive, I believe, being usually considered to be about the equivalent of 2½ cars.

I discussed that with a railroad man and that was his idea, about two and one-half cars to an engine.

Q. You got information from experienced men that led you to believe that this was correct, is that it?

A. Yes, sir.

Q. In the next division of expenses "Maintenance of Equipment" I see you state that:

"The expenses under this head are divided between yard, and local and through road locomotives on the basis of locomotive mileage of each class during the month of October, 1907," and that you have:

"Added 50% to the mileage made by yard locomotives to provide for the possible extra maintenance due to yard service; have added 50% to the mileage of road locomotives in local service to provide for the possible extra switching mileage, and again have added 50% to the switching mileage of the local train engines thus ascertained to provide for the possible extra maintenance due to switching service":

What were your reasons for making those additions to the
2502 apportionment of the cost of the local trains?

A. I have always understood that switching engines owing to the nature of the work they do, require a great deal more maintenance expense in proportion to the mileage they make than road engines require, and the 50% was added to make provision for that, although we had no definite percentage that we could apply, and used that arbitrarily.

Q. That is an effort to take care of what you understand to be an extra service performed in that line of traffic?

A. As to the local engine it is. The yard engine is just to take care of the extra repairs due to the work done by the yard engine.

The local locomotives, as we explained under the head of "Maintenance of Way and Structures" make a switching mileage in addition to their regular road mileage and we applied the same percentage of increased repair expenses as in the case of the yard locomotive.

Q. The next division is "(B)—freight cars";

I see you state: "This amount is apportioned to Arkansas by the Company on a car mileage basis. In dividing this expense between local and through service, however, we have taken into consideration the elements of repairs due to the stopping and starting of trains at way stations and repairs due to extra terminal handling of cars in local service."

2503 What figures and what authority did you have for adopting the percentages that you allowed for this extra expense for that service?

Mr. MOORE: I want the record to show that I object to that, if your Honor please.

A. The figures, of course, were obtained from the records of the railway company as to the maintenance of the cars.

The authority for the division as we had it as between starting and stopping and terminal handling, was the book by Mr. Wellington, as explained in the exhibit.

Q. Give the title of the book?

A. "The Economic Theory of Railway Location." The author is Mr. A. M. Wellington.

Mr. MOORE:

Q. Give us the date of that.

A. The date of this particular publication was in 1908, but the work was written a good many years ago and has been revised at various times.

Mr. MOORE:

Q. I want to get the date of that particular part of it which you refer to here, page 203.

A. You are referring to the statistics on which it is based, I suppose.

Mr. MOORE:

Q. Yes.

A. The date is not clear here, but it is back about in 1890 or prior to that time. I don't believe the statistics come up much later than 1890.

2504 Mr. MOORE:

Q. And that is found on Page 203 of the edition that you hold in your hand, what edition is it?

A. It is an edition published in 1908.

Mr. HILL:

Q. You say that you have assumed that each local train makes a stop every five miles and each through train a stop every twenty miles:

Have you information or did you gather information as to that fact in order to make a proper apportionment between the two?

A. I gathered information; that is the only way I could get it on that particular.

Q. As I understand it, Mr. Wharton, you have, as explained here, endeavored to take care of all these elements of extra cost in these matters that have been stated by railroad operating men to be extra cost: is that it?

A. That has been the idea in working it up in this way.

Q. Mr. Wharton, the next sub-division I see is "Supervision and General Expenses" headed "C" in your exhibit:

I wish you would explain your method of dividing that between the local and through service?

A. That is divided between local and through service in proportion to the total maintenance of equipment charged and assigned to the local and through service as explained, before taking up supervision and general.

Q. Explain that method of dividing charges of that class?

2505 A. Well, that is a method that is very commonly followed in the business world. In the apportionment of general and supervisory expenses they generally follow the direct expenses and they are generally so apportioned.

Q. That is recognized among accountants, is it, and the business world, as a correct method of apportionment of general expenses?

A. Yes, sir.

Q. Is it constantly used by your firm and other accounting firms?

A. Yes, sir, wherever we have occasion for the apportionment of that class of expense we invariably apportion them in that method.

Q. The next division is "3—Traffic Expenses": How have you apportioned those?

A. We simply followed the railroad method of apportionment of those expenses there and apportioned them on the basis of the total freight revenue, intrastate and interstate.

Q. Do you think that is correct?

A. No, sir, I don't believe that is a correct method of apportionment of expenses.

Q. Have you been able to work out anything to your own satisfaction that you think is a correct method?

A. No, I have not been able to work out anything that could be applied here. I think it might be possible to get a closer approximation of those expenses if proper statistics were kept as to the

2506 freight that is influenced by the solicitors and other traffic men, but in the absence of any statistics on that, I don't know of any method that could be followed in apportioning those expenses.

Q. Do you think this is fair to the state?

A. No, sir, I think this unduly burdens the state traffic, that being largely non-competitive traffic and not requiring the services of traffic men particularly.

Q. Are there other methods than a revenue division of that to get at an apportionment?

A. Well, I suppose some method could be worked up. I don't know of any class of expense that could not be divided on some method. A person would have to go in, though, and study the work of traffic men and the results they obtain and work up a method from that study.

Q. Could that be worked up like you work up cost and expense systems for business concerns?

A. Undoubtedly something could be worked up along that line

that would be a pretty fair approximtaion of that expense between state and interstate business.

Q. The railroads have no statistics on that line?

A. No, sir, none that we could use in working up this division here.

Q. Then, in the absence of statistics for a proper basis you merely accepted the railroad basis for this?

A. The revenue basis. I don't know that they followed
2507 exactly the division that we did, but we followed the revenue basis which is the one used by them in general.

Q. I believe this is a comparatively small item. It would not make much difference in the general result which way it was divided?

A. No, it would not make a great deal of difference which way it would be divided.

Q. The next item is "Transportation Expenses":

I believe you have explained that pretty fully, Mr. Wharton, in this statement, but you might repeat into the record just your method of dividing the station expenses which is the first item there under "Transportation Expenses"?

A. The station expenses are divided between state and interstate business and not between local and through train service. They are divided on the basis of total tons of freight handled in Arkansas during the six months period, assuming, however, that each state ton received two handlings and each interstate ton one handling.

Q. That has been the allowance that you have made in this for two terminals of the intrastate traffic on this particular item?

A. Yes, for two handlings at stations on state traffic as to one handling for interstate traffic.

Q. The next sub-division is "Yard and Terminal Expenses":

I believe that follows the others as explained in that sub-
2508 division.

The next sub-division is "Fuel and Locomotive Expenses":

I wish you would explain your method of apportioning expenses there—that is, under sub-division "C."

A. Well, the sub-division explains it pretty well. We took as a basis for it the test made by the St. Louis Southwestern Railroad Company during October, 1908, of the actual fuel consumption of local and through trains.

Q. Could you get the actual fuel consumption of the Iron Mountain?

A. We could not. We were unable to get that.

Q. Did you make an effort?

A. Back in October, 1907, Mr. Hamilton was instructed to get the actual consumption if possible.

Q. Now, you say you have adopted the proportion that was found in the St. Louis Southwestern Railroad test: did you have any information that that would be a true comparison for the Iron Mountain?

A. I think Mr. Doddridge testified along that line.

Q. We had better refer right in this connection to that St. Louis Southwestern test, it shows there: can you get the Exhibit number.

A. Exhibit- No. 19 and 20.

Q. The next item to which I call your attention is "Engine House Expenses":

2509 I see that you have allowed that the local engines require 12% more service per engine mile than the through: how did you get at that?

A. By taking the average local engine run as compared with the average through engine run, as shown in our statistics Exhibit "I."

Q. So as to make proper allowance for the extra care of the engine?

A. For the extra use of the engine house by the local engine compared with the mileage they make.

Q. The next item, under sub-division (E) is "Road enginemen and trainmen": what did you do in that case?

A. We worked up an actual division of that expense on the Iron Mountain during the month of October, 1907, and used that actual division as a basis for the division for the six months' period.

Q. And applied what you found for the one month as applicable to the six months' period?

A. Yes, in the same proportion.

Q. That was from actual figures from the books of the Company, was it?

A. Yes, sir.

Q. The next item, under sub-division (F) is "Other train expenses": how did you handle those?

A. Well, they are divided on the train mile basis as explained there.

2510 Q. The next item is "Loss and Damage" under sub-division (G): how did you follow that?

A. We worked up the actual claims paid during the month of October, 1907, and charged to that account and apportioned the item for six months on the basis of that one month's figures.

Q. Those are actual?

A. Those are actual for the one month.

Q. Now we have, under sub-division (H) "Supervision in General": I suppose you followed the principle you have heretofore explained on that?

A. Yes, sir.

Q. The fifth heading is "General Expenses":

You handled that on the basis of the direct charges on this accounting proposition that you have referred to?

A. Yes, sir.

Q. Under the eighth heading you have "Total cost of intrastate and interstate business": how did you ascertain that?

A. The method of ascertaining that is shown under the head of No. 7, the method of dividing train cost. It is explained in detail.

Q. The next heading is "Miscellaneous revenue, taxes, rentals, hire of equipment and value of property":

That was divided on a straight revenue basis you have stated?

A. We just followed the railroad division with the exception of "Miscellaneous revenue." They made no division between state and interstate, but set aside the portion of the expenses.

2511

Q. What did you do with it?

A. We divided it on a straight revenue basis, classified as to intra and interstate.

Q. Then, I see you take the assessed value of the property and double that, following the railroad plan on the revenue basis?

A. Yes, sir.

Q. Do you regard that as right?

A. No, I do not regard that as being correct.

Q. Why is it not correct?

A. Well, I can't see that the revenue has anything to do with the division of the value of the property or can be used in that way. I do not see the relation between the two.

Q. In your experience as accountant do you know whether that method is adopted in business affairs, accounting affairs, to ascertain the division of property or cost of service?

A. I do not know of any case that it would be used in ascertaining the expenses of any given service. Of course, this is the only case I have ever seen where any division of property was necessary between different classes of business.

2512

Q. Have you given thought and investigation to that subject, Mr. Wharton?

A. I have given considerable thought to the subject of the proper division of property, yes, sir.

Q. Have you any opinion of what is more nearly a correct basis than the revenue basis for that?

A. My opinion is that the cost basis is the more correct basis for the division of property. Owing to the fact that the cost, taking into consideration the elements of extra use of property and the extra property required—if any extra property is required in the service performed—that it would be the best measure of the property required.

Q. That would take into consideration, then, all of the use, whether extra use or not?

A. It would take into consideration all of the use, the cost basis.

Q. Would it be subject to the fluctuation the revenue would be?

A. No, sir, it would be subject to no fluctuation except the fluctuation in expense.

Q. What do you think of the revenue division of the expenses? You were speaking of the revenue division of property.

A. My opinion of that is the same as it is on property, that it is no basis of division at all.

Q. In this table of statistics that you have prepared, I understand you have accepted the railroad division on that in the absence of anything else, and worked up the calculations accordingly?

2513

A. Yes, sir.

Q. The next statement I find here seems to be the passenger side of the question.

A. Yes, sir, and I will file that as my exhibit "L."

I have an explanation of Exhibit "L," and I will file that as "Exhibit M."

The papers last referred to are marked "Defendant's Exhibit L" and "Defendant's Exhibit M."

The said exhibits are in the words and figures following to-wit:

For Exhibit "L," see Volume 9, page 5801.

For Exhibit "M," see Volume 9, page 5803.

2514 Q. This Exhibit M, as I understand you, explains your method used in Exhibit L?

A. Yes, sir, it explains it in detail.

Q. Now, Mr. Wharton, turn to the next statement that you have prepared there, which will be Exhibit "N" and state what that is.

The paper last referred to is marked "Defendant's Exhibit N" and is in the words and figures following to-wit:

For Exhibit "N," see Volume 9, page 5809.

2515 A. Exhibit "N" is a statement of the revenue, expenses and net earnings in Arkansas, both freight and passenger, as divided between state and interstate, mail and express business.

Q. For what period?

A. For the six months ending December 31, 1907. The statements of train cost that we have just discussed are carried into this statement on line 2-*a*, in the columns running across the page, under the head of "Operating Expenses."

The miscellaneous revenue, taxes, rentals, hire of equipment, dining car deficit, assessed value of the property, were carried into this statement from the exhibits showing the freight and the passenger division of expenses.

The revenue from freight, passenger, mail and express business (line 1-*a*) is the revenue shown by the railroad company in its statements filed in this case.

Q. The total percentage shown of earnings and the value of the property, for the whole intrastate business, was 7.50%?

A. That is the total business in Arkansas that 7.50%.

Q. Now turn to the next page where we get the total intrastate (which statement will be marked "Defendant's Exhibit O"), and state what is the total intrastate return on the property as shown there?

A. The total intrastate return on the property would be 7.69%.

2516 The paper just referred to is marked "Defendant's Exhibit O" and is in the words and figures following to-wit:

For Exhibit "O," see Volume 9, page 5811.

2517 Q. That is excluding mail and express?

A. Yes, sir.

Q. Now, Mr. Wharton, have you calculations made on the Cotton Belt on the same line?

A. Yes, sir.

Q. There is one question I want to ask you about your passenger business in the statement you have just testified about: did you make a division between the local and through passenger trains?

A. No, sir.

Q. Why did you not do that, Mr. Wharton?

A. The reason was that we did not have any available passenger mile statistics showing the movement of the state and interstate business on local and through trains during this period.

Q. I wish you would attach the figures you have made in the Cotton Belt Case as exhibits.

A. I will attach Exhibits "P to V" inclusive.

The papers just referred to are marked "Defendant's Exhibits P to V" inclusive, and are in the words and figures as follows to-wit:

For Exhibit "P," see Volume 9, page 5813.
For Exhibit "Q," see Volume 9, page 5815.
For Exhibit "R," see Volume 9, page 5817.
For Exhibit "S," see Volume 9, page 5826.
For Exhibit "T," see Volume 9, page 5827.
For Exhibit "U," see Volume 9, page 5832.
For Exhibit "V," see Volume 9, page 5834.

2518 Q. Look at Exhibit V, excluding the mail and express, state the percentage of return on the valuation of the property of the Cotton Belt for this six months period?

A. Intrastate it is 9.16%.

Mr. HILL: Mr. Moore, I will turn Mr. Wharton over to you now. I want to examine him on some other propositions later, but you may examine him now if you wish.

2519 *T. F. Wharton.*

Cross-examination.

By Mr. MOORE:

Q. Mr. Wharton, how long have you been engaged in the occupation of an accountant?

A. Since the first of January, 1902; a little over eight years.

Q. Prior to that time what was your occupation?

A. Prior to that time, for about six years, I was City Clerk in a small city in Wisconsin. Prior to that time I was in a newspaper office as Printer and Business Manager and all-around man. That is practically all.

Q. Where did you begin to practice as an accountant in 1902?

A. In Chicago, for Haskins & Sells.

Q. What character of work did you do?

A. The first work I did for Haskins & Sells was some city
2520 work that the firm was doing at that time in Chicago.

Q. What was the character of that work?

A. The character of the first work I did was work connected with the Special Assessment records of the City of Chicago. It was regu-

lar accounting work in connection with that. The next I did was——

Q. What was the character of that work?

A. The firm had a contract to bring down to date from the time of the Chicago fire, the Special Assessment records of the City of Chicago and it was in that class of work that I spent about a month, I think it was, when I first went to work.

Q. That consisted of collecting and compiling such records as could be found on that subject? Well, what was the next?

A. The next was in connection with the installation of the system of accounts for the City of Chicago. I spent about two months on that.

Q. What character of accounts were you dealing with in that work?

A. The particular work I had to do with was in the Collector's office, the City Clerk's office and City Treasurer's office; looking after the accounting in those offices.

Q. How long were you engaged in that work?

A. I think I spent just about two months on that.

2521 Q. Your work there, I suppose, was in developing some system of keeping the records of those offices?

A. Yes, sir; the system had already been outlined and it was my duty to see that the outline was carried into effect.

Q. What did you next take up in accounting?

A. The next engagements we were on were private engagements, both manufacturing—well, manufacturing was the next work I was on, principally.

Q. Tell me what character of work that was.

A. The particular character of work I did on the next engagement, for about three months, was in connection with the taking of inventories of work in progress, finished stock and raw material, and of foundry product. That was for about three months.

Q. And what followed that?

A. The work that followed that was more city work.

Q. What was the character of that work?

A. There were small engagements in between, but the next particular engagement I was on was city work in the City of Houston, and auditing for a period of three years of all the city's books and accounts, and the preparation and installation of a system of accounts for the city.

Q. By whom was that system outlined?

A. I assisted in that.

Q. How long were you engaged on that work?

2522 A. I was engaged on that work for about ten months.

Q. In that work you dealt with the city accounts?

A. Yes, sir.

Q. That brought you down to about what date?

A. That brought me down to about the first of June, 1903.

Q. What did you do next in connection with accounting work?

A. I cannot remember all the engagements I have been on; some of them were small and some of them were large.

The next recollection of any I had was with a large manufacturing concern, in connection with an analysis of the appraisals of the properties of the concern. I do not remember just how long I was on that but I think perhaps up until August. That was in Chicago.

Q. Some two or three months?

A. Yes, sir.

Q. What manufacturing concern was that?

A. I would not care to give the name.

Q. I do not want the name, I want the character of the manufacturing.

A. Well, they manufactured farm machinery.

Q. Machinery?

A. Yes, sir, manufacturers of machinery of all kinds.

Q. Now, you say that was in connection with the appraisal?

2523 A. Yes, sir, analysis of the appraisals of the plants of several large concerns.

Q. What did that work consist of, Mr. Wharton?

A. Well, it would be pretty difficult to explain that.

Q. I mean in a general way?

A. In a general way it was taking appraisals that had been made by two different concerns, setting them side by side in detail, and working out the difference between the two, what it meant in dollars and cents, in machines, also, and in property.

Q. Did it also involve the valuation of the property?

A. No, sir; I had nothing to do with the valuation.

Q. I do not mean did it involve valuation by you, but the valuations placed by others on the property?

A. Yes, sir.

Q. What work followed that in your accounting work?

A. The next engagement was the audit of a retail lumber company. I cannot remember just how long it took me on that, but I think I was at work on it two or three weeks. That was not a very large engagement.

Q. In that work you went over their accounts, did you?

A. Yes, sir.

Q. Following that what was your accounting work?

A. The character of the next engagement was the investigation of the accounts of a county in Oklahoma, extending over a period of a good many years.

2524 Q. How long were you engaged at that?

A. I suppose some five or six weeks; I can't just remember exactly.

Q. In a general way what followed that?

A. The engagement that followed that was the preparation of a system for Oklahoma City.

Then following that was some small miscellaneous work here in St. Louis.

Q. Commercial work?

A. Yes, sir; it was just small work, the work I did at that time, just auditing, and work of that nature.

Then, following that, I went to New York and spent a little over

a year there, auditing for various concerns and preparing systems of accounts for a few of them.

Q. Were those industrial and commercial concerns?

A. Yes, sir, and manufacturing; preparing systems of accounts and work of a general accounting nature; different kinds of work, hard to classify.

Q. To about what time did that bring you?

A. About Nov. 1, 1904. I left New York and came west and prepared and installed a system of cost accounts for a large manufacturing company, which took me about until the next June or July, that is, 1905.

Then I came to St. Louis to take temporary charge of our St. Louis office and I have been here practically all of the time since that.

2525 Q. What work did you engage on when you came to St. Louis?

A. I just came down to take charge of the work of the office. I have forgotten what the office was doing. They had several different engagements they were working on.

Q. That was commercial work, though?

A. Yes, and manufacturing.

Q. About how long were you in charge of that character of work?

A. I have been in charge of it ever since.

Q. Mr. Wharton, in your experience in connection with the accounts of industrial and manufacturing concerns, what do you find to be their practice in charging off items such as depreciation and accounts of that kind?

A. Depreciation, particularly?

Q. Yes.

A. Well, very few concerns have any fixed rule as to charging off depreciation. It would be difficult for me to state what we found as a general practice among corporations. There is no general practice.

Q. From your experience in commercial accounts and the accounts of manufacturing and industrial concerns, what is the proper rule in that respect?

A. I could not give it. I can only take each individual case and work it out. I cannot give any rule.

Q. There is a system, is there not, of charging off a cer-
2526 tain amount for depreciation in plants, and that which is used in manufacturing and industrial concerns?

A. There is no particular system. Each plant and each corporation governs the question of depreciation itself. There is no system that I know of that is followed by plants; that is, generally.

Q. Each one adopts a method of its own, you might say?

A. Yes, sir, each generally adopts a method of its own.

Q. Do you find, as a rule, that establishments of that sort do have some system?

A. Do you mean as to the depreciation accounts?

Q. Yes.

A. No, I can say that, as a rule, the concerns that I have had to

do with have no such system; a few of them have. Where we have installed systems of cost accounts we always try to provide for depreciation.

Q. Why do you do that?

A. Because of the wearing out of the plant; the invisible wearing out that cannot be represented by repairs and renewals.

Q. What account do you charge that to?

A. To depreciation.

Q. Do you carry it as an expense?

A. Well, in a manufacturing concern it nearly always goes into factory expenses. The depreciation of buildings, used in manufacturing and the equipment used in manufacturing is usually taken up as a manufacturing expense; one of the indirect
2527 expenses of the manufacturing, as a general rule.

Q. What allowance do you usually make in your charge for depreciation?

A. It is generally an arbitrary figure arrived at by the management as to what they think they should charge off. I never worked on any rule of that kind myself.

Q. When you adopt a method of that sort it is for the future as well——

A. Yes, sir, for all time; supposed to be.

Q. Then the rule, whether arbitrary or otherwise, is one that you expect to be regularly applied in practice?

A. Yes, sir.

Q. And whatever it is will be applied with the same uniformity after such system has been adopted?

A. That is the idea of the thing.

Q. You say it is done in order to cover invisible—you might say an undefined loss or expense incident to business of that kind?

A. Yes, sir.

Q. Is it necessary in order to enable an industry, or a person or corporation conducting a manufacturing industry or anything that employs the use of plants and perishable things, to do that in order that the books may properly reflect the financial condition of the concern?

A. Yes, I think it is necessary that that be done.

Q. You say you usually adopt an arbitrary rule: do you not have some uniform method by which you measure that rule? Although it might be arbitrary, was there not some
2528 consideration upon which you acted in establishing that rule?

A. Well, usually the amount of depreciation to be charged off is determined after a consultation with the superintendent and with the other officials of the Company, and those most competent to know.

Q. I suppose really, the underlying principle is that it should be such a charge as would represent in money value the depreciation.

A. That is the underlying principle.

Q. The annual depreciation?

A. Yes, sir.

Q. When did you first undertake any work in connection with railroad accounting?

A. The only work that I have undertaken has been in connection with the Missouri and Arkansas rate cases. That was started, I believe, about June, 1906.

Q. Was that your first experience in connection with railroad accounts?

A. Yes, sir.

Q. Have you ever had any experience in railroad operation?

A. No, sir.

Q. The only experience or means of obtaining information in connection with railroad system accounting is what you have gathered in these two cases that you mentioned?

2529 A. Well, I have had occasion to go into the Interstate Commerce Commission reports, more or less, and into their system of keeping the accounts.

Q. Was that in connection with these cases?

A. Yes, it has been, and perhaps outside of that; just simply as a matter of accounting information.

Q. You say you began that work in 1906: what was your first work in that line?

A. My recollection is that our first work was to take reports that had been filed by the Wabash Railroad in the Missouri rate cases and to start in on an examination of the data back of those reports in the railway offices.

Q. Where was that data found that you examined?

A. I only had charge of that work and did not get into the offices myself, in particular, to look after where it was found.

Q. In other words, you did not give it personal attention?

A. Not close personal attention, no, sir.

Q. What was the next phase of your connection with railroad accounting?

A. Principally it was in the discussion of all these matters with the accountants we had on the work and the preparation of statistics and information in relation to the results of their work.

Q. Your connection was more in the nature of consultation rather than of actual work in the offices, then?

2530 A. Yes, sir.

Q. Was that the fact throughout the Missouri rate case?

A. Yes, sir.

Q. You did not devote any personal effort or work to the examination of the accounts yourself?

A. Not in the offices of the Railroad Co., no, sir.

Q. How long did that engagement in connection with the Missouri rate case continue?

A. Until about January or February last year, I believe it was, 1909.

Q. I believe you were not a witness in that case, were you, Mr. Wharton?

A. No, sir.

Q. When did your connection with these cases begin?

A. Well, the first real work we did in connection with these cases I think must have been along in May or June of last year.

Q. 1909?

A. Yes, 1909.

Q. That work, and the work you have done since then, and the work you describe as having been done by you in the Missouri rate cases represents your experience in railroad accounting?

A. Yes, sir.

Q. What has been the character of your work in connection with these cases?

2531 A. It has been supervisory; planning the work to be done with Mr. Hamilton and the other accountants on the work.

Q. Have you gone personally into the accounts and into the books of the plaintiffs in these cases?

A. No, sir.

Q. Your work on these cases has been something like it was in the Missouri cases?

A. Except that I had a more direct connection with this case than I had in that case.

Q. What was the next work you were connected with in these cases?

A. I think the first work that we started to do in this case was to get at the movement of freight on local trains over the Iron Mountain, during the month of October 1907.

Q. When did you begin that work?

A. We must have started that shortly after we began this work. I am not just sure as to when we did start that.

Q. How long were you engaged in that work, Mr. Wharton?

A. I think we spent about four months on that work, getting up those statistics; four or five months; something like that.

Q. That was in May or June of last year?

A. Yes, or the first of July. It may have been close to the first of July when we started.

Q. When did you complete that work?

2532 A. The work was mostly completed within the next four months. We started into these hearings and there was still left a good deal to do in the shape of getting our final figures on that work. I guess it dragged along quite a while before we got it completed.

Q. You did not get those figures and the formulas which resulted from that work, ready to present to the plaintiffs in these cases until February of this year, did you?

A. Just about then, I think; whenever we sent a copy of the statistics to you; we were practically through with them at that time.

Q. At that time you were able only to furnish just a mere outline of the results?

A. Yes, sir.

Q. You had not been able to get your work into condition so you could furnish detailed statements until you filed these exhibits in this case—from "I" to "O" I believe they are.

A. We have been working on these exhibits from the time we fur-

nished you with a copy of the statistics until the hearing began in this case.

Q. You were not able to work the problem out so as to prepare exhibits, until about the time you presented the exhibits, were you?

A. No, sir, not finally.

Q. Have you attended and been connected with the taking of testimony and proceed-ngs had before the Master since we began taking testimony last Fall in this case?

2533 A. I have attended very few times.

Q. Have you been in St. Louis?

A. I have been in St. Louis most of the time. I have been away a few days at a time.

Q. But you did not take an active part in the hearing before the Master?

A. No, sir.

Q. I believe you stated that you made no investigations of the railroad accounts or records in the Missouri cases.

A. Not personally, no, sir.

Q. Nor in fact in this case?

A. Nor in fact in this case.

Q. Did you prepare or draft the statement or formulas that were used in the Missouri case?

A. I worked with Mr. Taliaferro, Mr. Ludlem and others of our organization, on those statements, but I cannot say I prepared them; no, sir.

Q. Who outlined the work and suggested the character of work that was done on the statements in that case?

A. Those were worked up jointly. Mr. Taliaferro I think, had more direct connection with that work than any other one in our organization, but all of those statements were worked up altogether in our office.

Q. Who was in charge of that work?

A. Mr. Taliaferro was more directly in charge of it. He

2534 worked at it all the time he was here.

Q. Who assisted him in that work, Mr. Wharton?

A. Oh, several accountants. I do not remember now just who they were; Mr. Hamilton, principally.

Q. I believe the same is true in this case is it not, that you did not work up these formulas that have been introduced in this case?

A. They were worked up in our office after a consultation, talking back and forth.

Q. Did I not understand you to say on your examination in chief, that Mr. Hamilton had prepared these formulas and that you personally——

A. Not the formulas. I did not understand your question.

Q. To what extent did you participate in the preparation of these formulas contained in exhibits "I" to "O"?

A. I participated actively in the preparation, of the formulas and in the working out of the results, but it was worked out, as I say, through consultation in our office.

Q. But you did not go into the details in working out the result?

A. Not in working out the statistics in the railway office, no, sir.

Q. Did I understand you to say on your examination in chief, that while you did not do the detail work, that was done by others;

2535 that you suggested the line on which the work *that* was to be done.

A. I had charge of the work and to that extent did suggest it, but it was all worked out by Mr. Hamilton and others in our organization, after consultation.

Q. By whom was the method originated of dividing these accounts and the expenses of railroad operation as between local and through trains, and state and interstate traffic?

A. Well, the most of the ideas I think came from the testimony in these cases. The ideas originated, with Mr. Hamilton and myself after my reading of this testimony, and the testimony in the Missouri case, and with Mr. Hamilton's understanding of the testimony in those cases.

Q. What did you base it upon, upon the reading of that testimony?

A. The main idea, I think, came from the reading of the testimony in those cases.

Q. You considered that a basis on which to make those divisions?

A. The testimony of the witnesses of the railroads seemed to be based on the difference in cost between local and through service, and that suggested to us the idea of working up statements of the cost of local and through service.

Q. I was going to ask you upon what features of the testimony you acted in making that line of investigation and division.

2536 A. Just the general run of the testimony all the way through; the operating men, principally. I could not specify any particular witnesses.

Q. I do not mean any particular witnesses: I just mean in a general way: in what respect, Mr. Wharton, do you think that the plan upon which the division is made in the exhibits filed by you in this case, is superior to the plan that was suggested by the plaintiffs' witnesses?

A. You mean the revenue theory?

Q. Yes.

A. Well, it seemed to me that this plan carries into effect all the reasons given by the railroad witnesses as a basis for their ideas of the extra cost of doing state business; while their ideas seem to be based more on opinion as referring to the revenue.

Q. Are your divisions not based upon opinion as well as the method of apportionment that was indicated by the testimony of the plaintiffs.

A. No, not so much so.

Q. To what extent is there a difference?

A. The revenue theory is all opinion, and the plans worked on here have considerable basis of fact behind them all the way through.

Q. Do you mean that the plan outlined in these exhibits was not based on assumptions?

A. They are based upon assumptions, yes sir; but the
2537 assumptions treated with each separately and not as a whole.

Q. Are the divisions you have made here based on any knowledge or information you have as to what occurs in actual operation of railroads?

A. No, I have no knowledge as to the actual operations of railroads.

Q. It is based on information you have obtained by reading the testimony in this case?

A. Quite largely, yes sir.

Q. And you have taken that as a foundation for the programme that is outlined, or the method of division that is outlined in your exhibits?

A. Quite generally, yes, sir.

Q. Now, I believe you say you began work last year, for the purpose of ascertaining the movements of freight during the month of October, 1907—you did not say that month, but that was what you meant, was it not?

A. Yes, I think I stated October 1907; on the Iron Mountain.

Q. What was that work based on? What record in this case was that work based on?

A. The railroad record.

Q. I believe you stated it is based largely on exhibit No. 26.

A. Well, we used that exhibit in connection with the work that we did for that month.

Q. If I understand your plan, you have attempted to di-
2538 vide train expenses, as between local and through trains, first?

A. Yes, all expenses as between local and through trains with the exception of station and traffic expense, and a portion of general expenses?

Q. Your entire fabric, you might say, is built up on that theory?

A. Yes, sir.

Q. Dividing expenses between local and through trains?

A. Yes, sir.

Q. Where did the data come from, from which you made that division between those two classes of trains?

A. From the records of the Railroad Company.

Q. I want you to particularize and tell me what particular records.

A. Mr. Hamilton worked up most of that and I cannot do so. I turned that over to him to be worked up.

Q. You are not prepared, then, to be examined on the details of that?

A. No, sir.

Q. Mr. Wharton, you stated—I quote it here from the testimony; turn to it in case you wish to see it—in your testimony in chief, that you were "familiar with the methods of operation and expenses adopted by the railroads and adopted by the State in that case."

—. What did you refer to in that statement?

2539 A. The quotation is on page 504. The answer to my question there meant that I was familiar with the issues in the

Missouri cases and with the main points made by the railroad companies and by the state.

The testimony does not seem to be very clear there on that point.

Q. You did not mean to say that you were familiar with the methods of operation?

A. No, sir, I am not familiar with the methods of operation.

Q. Mr. Wharton, do you then feel that you are qualified to say as to how the expenses in operating a railroad should be divided?

A. Excepting from the point of view of an accountant, I am not.

Q. But from the point of view of the practical operation of a railroad you do not pretend that you are.

A. No, sir.

Q. Do you think it is possible to arrive at the comparative cost of operation as between the different classes of railroad traffic?

A. I think that one can get a very close approximation, but not an exact statement of cost of operation of any particular class of traffic.

Q. What do you base that view on?

2540 A. Just on my accounting experience; the fact that it is done every day in other branches of business than the railroad business; the cost worked out from——

Q. Do you believe that you are as well qualified to judge of the practicability of making a division on the actual basis of cost as men who have devoted their lives to railroad operation?

A. As to the accounting features, it has been my experience that an accountant who would study those matters can work out a plan that will be better than the plan of an ordinary operating man who is not familiar with the accounting features.

Q. That is simply a plan from a book-keeping or a clerical standpoint?

A. From an accountant's standpoint.

Q. That is what I mean. When you get down to the actual thing in practical use for the purpose of enabling an operating man to exercise his judgment as to the method of operation—to ascertain what the different branches of traffic cost, relatively, would you not think his experience would serve that purpose better and be more useful in obtaining practical results, than an accountant's?

A. His general knowledge, I think, would be better than that of an accountant, but I think that an accountant would go in and study the situation and lay out a set of accounts that would give results that an operating man would not know from his general knowledge of the business.

2541 Q. Is not the experience of an operating man in his connection with the operation calculated to give him more specific knowledge than that of an accountant who looks at it only from a distance?

A. The operating man just looks at the matter in general and not at a specific item.

Q. Suppose an operating man says he has made a study to try to ascertain the relative cost; he has been engaged in actual operation; it is part of his duty and constant work; the point I want to call your attention to is this:

Does not the fact that he is closely in touch and associated with the actual operations and workings, give him a better opportunity of judging of the practicability of making a division and the basis on which it should be made, than a man who has no familiarity whatever with the operation of a railroad?

A. It should.

Q. Now, how can you or any accountant, form any definite idea as to what is a fair basis of division of the expense of operation as between a local train and a through train, without some knowledge of the practical workings of those two classes of trains?

A. Well, a person can gain some knowledge of that by reading the testimony in this case. That is where such knowledge as I used in this case came from; in reading the testimony of the operating men; going through their testimony and getting their

2542 ideas.

Q. That second hand knowledge is derived from statements of operating men?

A. In this case.

Q. That is what you relied on?

A. Pretty generally, but not altogether.

Q. How long were you and your associates engaged in connection with the Missouri case?

A. We must have been engaged on that two and one half years.

Q. Who were associated with you in that case?

A. M. Taliaferro, principally. Mr. Hamilton was at work there and Mr. Ludlam.

Q. I believe you said you began your investigations in that case in 1906, did you not?

A. About June 1906, if I remember rightly.

Q. When was the testimony in that case taken?

A. I think they began to take testimony along in September or October, the same year, and it continued until about the first of January last year, at varying intervals.

Q. Did the representatives of Haskins & Sells prepare and file in that case a basis of dividing expenses?

A. We prepared numerous exhibits there. I do not recollect, I would have to see them.

Q. Do you know at what stage of the case those exhibits were introduced?

2543 A. No, sir.

Q. It was in 1909, was it not?

A. I could not say as to that. I did not attend the hearings, so I would not say.

Q. I want to ask you if as a result of the study and investigation of yourself and Mr. Taliferro, and those who were associated with him in that case, caused you to use this basis in that case:

"Miscellaneous earnings, both freight and passenger, were divided between state and interstate on a basis of the actual state and interstate freight and passenger earnings. That means they were, in the case of the C. R. I. & P. R. R., that intrastate passenger earnings amounted to 50.29% of the total passenger earnings, the state divided the miscellaneous passenger earnings, which includes both

mail and express, between state and interstate traffic, assigning to the state traffic 50.29% of the total miscellaneous earnings.

The operating expenses were divided between state and interstate traffic on the basis of the ton miles and passenger miles of each class of traffic.

Taxes and rentals were divided on the same basis used in dividing operating expenses.

The valuation of the property was determined by multiplying the assessed value by three and dividing the amount thus ascertained between each class of traffic in proportion to the gross revenue of each class."

2544 Is not that the basis that is contained in the statement prepared by Haskins & Sells' representatives in that case?

A. I would have to examine the schedules to determine the correctness of all the statements you have made there.

Q. Have you copies of your exhibits in that case?

A. We have a copy of the testimony in the case, a printed copy of the testimony.

Q. Now, I hand you copy of the Rock Island exhibit in the Missouri rate case: I wish you would examine it and state if what I read to you is not a correct statement with reference to that, Mr. Wharton.

A. I presume they are correct, but I do not know anything about them personally. I never examined the figures that were worked up.

Q. But what I have read to you is a formula that was used and presented to Judge McPherson?

A. Mr. Hamilton could testify better as to that. I am not familiar with it.

Q. What is your impression in regard to it?

A. My impression is that miscellaneous revenue was divided between state and interstate business on a basis of the gross revenue and that the expenses of operation were worked up on a ton mile and passenger mile basis, using different percentages in connection with them, of increased cost of state over interstate and that the basis of division of property was not changed from the basis

2545 used by the railroad company, although I am not sure of that. No comment was made on that, that I recollect.

Q. Was not the ton mile theory used with reference to the operating expenses without any other division, Mr. Wharton?

A. I do not just understand you.

Q. Was not the ton mile theory applied to operating expenses in gross without any sub-division of them by you in that case—without any destinction as between the expense of local and through trains?

A. They were made up, as I recall, without any allowance made for a distinction between local and through trains, but——

Q. That is the point to which I want to call your attention: the theory upon which the exhibits introduced in this case by you were filed was not suggested in that case, was it?

A. You mean that we filed in this case?

Q. Yes, "I" to "O" inclusive.

A. The general trend of the testimony of the railroads in that

case had a good deal to do with suggesting this method of dividing the expenses, yes, sir.

Q. This was the method suggested and adopted in that case by you, that you just outlined?

A. I would not say as to that. I would rather have the exhibits speak for themselves as to that.

Q. I do not want to put into this case the exhibits of that
2546 case, and if you participated to some extent in preparing them, you ought to be able to state what the result was.

A. While I participated in St. Louis in the consultations on that, my recollection is that the final exhibits were put in evidence in Kansas City and that they were worked over there considerably. I was not present at that time.

Q. Were you not sufficiently in touch and familiar with the work to enable you to state now.

A. Just on a general line.

Q. You were not in touch with the detail work?

A. No, sir.

Q. And working out the system of division?

A. Not the final result as put into the case. I was not familiar with that. I did not follow it closely.

Q. Your work in that case hardly educated you very thoroughly on that subject, did it?

A. We discussed it a great deal in that case.

Q. Is not the primary basis of all the statements that have been filed by you in this case the showing of tons, ton miles and revenue of all traffic, included in the October 1907 accounts, divided between trans-state, interstate and state, and between car-load and less-than-car-load? I refer to exhibit 26.

A. We used those statistics in connection with the preparation of this statement. I would not say that they were the primary
2547 division, though; the primary basis.

Q. I should have added so far as the Iron Mountain Railroad is concerned.

A. Well, my answer would be the same.

Q. Was not the statement filed by Mr. Kimbell, of operations of the St. Louis Southwestern Railway for the month of October 1908, as exhibits No. 19 and 20, I believe, the basis of the statement prepared by you with regard to that Company in connection with certain ratios which you have applied in some instances, from exhibit No. 26?

A. We used Mr. Kimbell's statistics as far as we had occasion to, in the preparation of our Cotton Belt statement, but I do not remember any particular connection between the Iron Mountain exhibit and the Cotton Belt.

Q. Do you know how exhibit No. 26 was compiled Mr. Wharton?

A. No sir, I am not familiar with the methods of its compilation. I think Mr. Hamilton is.

Q. What is your understanding of the effect of that exhibit as showing the tonnage moved by the St. Louis, Iron Mountain & Southern Railway in October 1907?

A. It shows the number of tons moved. I do not know just what that effect—I do not know just what you mean by your question.

2548 Q. I mean, what was your understanding as to the showing made there of the tonnage moved in that month.

I want to know whether in using that exhibit you did it with the understanding that it showed the tonnage moved in that month.

A. That was our understanding of it. To show the tonnage moved or handled during that month.

Q. Your statement is based on that assumption; that is, the statement prepared by you and filed in this case?

A. We used these ton miles in connection with our other ton miles, in connection with the local trains.

2549 Q. Now, Mr. Wharton, you have testified that you did not do the detail work in connection with the exhibits you have filed in this case:

I wish you would state who did handle the detail work in connection with those exhibits?

A. As to the statistics, the detail work was handled by Mr. Hamilton and under his direction.

Q. Who were the men connected with it? I want to know who were the men who did that work and I would like you to give me the names of all of them.

A. I will have to refer you to Mr. Hamilton on that, because he had charge of that work and disposed of the men as he saw proper, on the various classes of work they were doing.

Q. Are you unable to give me the names?

A. I would not care to state, because I don't know the individual work the men were doing up there. Mr. Hamilton does know that.

Q. Do you know what the cost of that work was?

A. No, sir.

Q. You could not undertake to state what the cost of that work was?

A. No, sir; I would not care to. I haven't worked it up at all to see.

Q. In Exhibit I, near the bottom of the page, is the heading, "Number of cars handled in and out of terminals":

2550 Will you state how that was arrived at?

A. Mr. Hamilton worked that up under instructions to take the wheel reports showing the total cars going into the terminals where yard engines were maintained, and the total cars shown by the wheel reports as going out of terminals where yard engines were maintained, and these figures were worked out on that basis. That is, during the month of October, 1907.

Q. I want to call your attention to Exhibit K: that exhibit, as I understand it, deals with the cost of "maintenance of way and structures" of all the business in Arkansas?

A. The part under that heading, "maintenance of way and structures" deals with the proportion charged to the freight business.

Q. What I mean is this: so far as the operation of the Iron

Mountain as a system is concerned, it is dealing with that part which is assignable to the state of Arkansas?

A. Yes, sir; that portion assigned to Arkansas, and assigned to the freight business by the railroad.

Q. Now, I am going to ask you where you got those divisions? In the first place, where did you get the basis upon which you acted here, as to that part of the business of the Iron Mountain system in Arkansas?

A. The total "maintenance of way and structures" the
2551 expense was taken from the exhibit filed by the railroad Company.

Q. I want you to show me that exhibit.

Statement 4, to Exhibit 3, filed in this case by the plaintiffs, shows a division of operating expenses on the Iron Mountain system which were charged to the state of Arkansas. Did you take that statement as a basis of the total expense of operation in this state?

A. I will explain this more fully: as to the "maintenance of way and structures" we took the total amount shown on Exhibit No. 3, page 2.

Q. That is taken from statement 4 of that exhibit, is it?

A. I don't know whether you call that statement 4, or not. It is——

Q. Just look at statement 4, and you will see what it is.

A. As I explained, the "maintenance of way and structure" expense was taken from item shown page 2, of Exhibit No. 3, where a division was made of that expense between the freight and passenger business. We took the total freight expense——

Q. I am not speaking about that. I am speaking of the expense in Arkansas, on the Iron Mountain system:

What I want to know is, where did you get the basis for your figures as to the expense of "maintenance of way and structures" in the state of Arkansas?

2552 A. We got that from this statement number 4, as to the total amount.

Q. You adopted that statement as reflecting the amount chargeable to this state? That is what I want to understand.

A. Yes, sir.

Q. Now, Mr. Wharton, as I remember, there was no similar statement filed by the Cotton Belt road: where did you get the expenses assignable to "maintenance of way and structures" in the state of Arkansas, on the Cotton Belt? When I say "Cotton Belt" I mean the St. Louis Southwestern Railway.

A. As to the "maintenance of way and structures" from Exhibit 32.

Q. What is the item there that you referred to?

A. "Maintenance of way and structures", I say, from Exhibit 32, which was a statement filed by the St. Louis Southwestern for the month ending December 31, 1907.

Q. Where did you get that portion of the expenses which you assigned to the freight traffic, and that portion which you assigned to the passenger traffic in your exhibits in this case?

A. From the books of the railway companies.

Q. From the books of the railway companies?

A. Yes, sir; books and records.

2553 Q. Statement number 2, to Exhibit 5, filed by the plaintiffs in this case, contains a statement of the basis upon which the division is made between freight and passenger traffic expenses: Is that the basis upon which you acted in dividing expenses as between freight and passenger traffic?

A. We made no division between freight and passenger of our own; simply taking the division made by the railway company itself.

Q. You simply adopted the division they had made?

A. We took their division.

Q. Why did you take that, Mr. Wharton?

A. We considered that it was good enough for the purpose we cared to use it for.

Q. Both as to state assignment and as to division between freight and passenger?

A. Yes, sir.

Q. And when you say that you apply it to both plaintiffs in this case?

A. Yes, sir.

Q. Either you or the representatives of Haskins & Sells doing this work, verified the figures and the bases presented by the railroad company, did you not?

A. In general, yes, sir.

2554 Q. On what basis is a division of expense as between freight and passenger traffic, on the Iron Mountain, made in the exhibits in this case?

A. On their exhibits?

Q. Yes.

A. It depends on the nature of the expense. They used various methods. It is all explained on this statement number 5, just referred to.

Q. It is largely on the revenue train mile basis, is it not?

A. Yes; largely on a revenue train mile basis.

Q. Did you think that was a proper basis to divide it upon?

A. As between freight and passenger, it was probably good enough for the purpose of this case. I would not care to pass a personal opinion on that, because I have not studied it sufficiently to form an opinion as between freight and passenger.

Q. Is not the division between freight and passenger the very basis and ground work of all the work you have done in this case?

A. Both freight and passenger. The rates and the expenses are the issue, and it seemed to me that a change in method would not materially affect the total result.

Q. Could you make an intelligent or satisfactory assignment of the expense of freight traffic or passenger traffic either, as between the several branches or departments of each of those kinds

2555 of traffic, without having before you a correct statement of the total of each?

A. Well, an approximately correct statement; as near as it can be made correct.

Q. Let me ask you: is not that the very foundation, the fundamental part of your work, that you must have a correct statement to work on, and must know the total cost before you can make any attempt to ascertain the cost in detail?

A. It is necessary to have the total cost of freight and passenger before you can go into detail.

Q. Did you ever in your experience in auditing the books of any industrial, manufacturing or commercial concern, act on the data before you, without first satisfying yourself that the total of whatever you were dealing with, was correct?

A. Either correct, or approximately as near so as it could be made.

Q. I want to ask you this in that connection: I believe you said you did not give that sufficient study to enable you to determine whether it was a correct division or not, as between freight and passenger?

Would it have required any greater examination to determine that question, than as to the proper division of the various elements, between state and interstate?

2556 A. Well, it would require considerable study, I think, to arrive at an exact correct basis, if one could be arrived at.

Q. Could you say that you were qualified to ascertain the cost in detail of freight traffic, and apportion it between state and interstate, without giving the matter sufficient study to enable you to arrive at an intelligent conclusion as to whether the total expense of operation had been properly divided between freight and passenger?

A. Having accepted the railway company's division between the freight and passenger, the only study that was necessary was as to a division of freight expenses between local and through, and the passenger expenses of the various classes. It was not necessary, particularly, to give any consideration to a division between freight and passenger business.

Q. You say you accepted the division between freight and passenger, made on the revenue train mileage:

Why did you depart from that basis in making your division of expenses of "maintenance of way and structures".

A. On a car mile basis?

Q. Yes.

A. It was our idea, after considering the matter, that a car mile, as between local and through, would more nearly represent the difference in cost.

2557 Q. What was the reason for that?

A. On account of the difference in the two classes of trains, local and through; and the difference in the cars they carry, and the number of cars in the train.

Q. I see you added 50% to the engine mileage of local trains, on account of station switching:

Where did you get that per cent?

A. That percentage was worked up after consultation with Mr.

Hamilton and with others, and was simply an arbitrary percentage added.

Q. That was simply an arbitrary assumption?

A. Yes, sir; an arbitrary assumption.

Q. You had no knowledge or information which qualified you to——

A. Except such as I just stated, discussing the matter with Mr. Hamilton and others.

Q. And you had to adopt some basis—an arbitrary one—just like it has been said in this case that the revenue basis was an arbitrary one? You had to have a basis and you had to take something for that basis?

A. We felt that something should be added to local engine mileage for that purpose.

Q. But you did not know whether fifty per cent or some other figure should be added?

A. No, sir.

2558 Q. Then you added 150% for each engine mile to make it equal a car mile: why did you do that?

A. We added 150% to engine mile, also after consultation with Mr. Hamilton and with others, as representing the difference in the weight of the engine and the cars.

Q. Did you weigh an engine and car for the purpose of ascertaining from actual weight what the difference was?

A. No, sir.

Q. Then what reasons were given in your consultations—if you had consultations you must have developed some reasons—for adopting that per cent? What was the reason, that is what I want to ascertain, because this is the foundation of your figures?

A. Well, if hearsay testimony is not competent, I would not be able to say.

Q. So you are unable to make an explanation?

A. Except upon information I gathered in consultation with men who were qualified to pass on that.

Q. What causes this extra amount of switching performed by the engines that haul local trains, Mr. Wharton?

A. Local service, according to the testimony of the witnesses in this case.

Q. What do you mean by "local service"?

A. Local service done by local tarins.

2559 Q. I understand that, of course: what necessitates that service?

A. Switching cars from the trains to the sidetracks——

Q. What makes it necessary?

A. The nature of the service itself. The witnesses in this case have testified as to that.

Q. The point I want to ask you is this: you have added fifty per cent to local over through trains to offset the extra switching: now, what character of freight causes that switching to be done—what class of freight?

A. The local freight that has to be distributed through the state, or to be picked up in the state.

Q. As between the interstate and intrastate freight carried on local trains, which causes it?

A. Both.

Q. In what proportion do they each contribute to the switching service? That is, produce the necessity of it?

A. Exhibit I of the Iron Mountain, will show the freight hauled on local and through trains.

Q. You mean your Exhibit I?

A. Yes, on the Iron Mountain; will show the freight hauled on local and through trains, both interstate and intrastate, and the relative volumes there would evidently indicate the necessity for the switching.

Q. I understand that, but the point I want to get at is this:

You say that you acted on the evidence in this case that
2560 there was a difference in the extra expense: Does not that evidence show, Mr. Wharton, that that extra switching expense results from and is caused by the handling of state freight?

A. Not according to my reading of the testimony; no, sir.

Q. Did you read Mr. McPherson's testimony?

A. I ran through it.

Q. Do you recall what he said about it?

A. No, sir.

Q. Did you have that in mind when you made this division?

A. No particular testimony.

Q. Whose testimony do you recall, of all the witnesses who testified in this case, that does not indicate that the extra switching cost on local trains grows out of state freight? If there is any one——

A. I recall no particular testimony on that point. The best evidence as to what the switching was for would be indicated by the freight carried on the trains, which is shown in our Exhibit I, on the Iron Mountain.

Q. Do you say, Mr. Wharton, that that exhibit contains any evidence whatever as to the character of service that has to be rendered for each of the two classes of freight, state and interstate?

2561 A. It indicates the volume of the traffic, both state and interstate.

Q. Yes, but does it indicate the different kind of service that is incident to the two kinds of traffic that is carried on local trains? Local trains carry state and interstate freight. You say the exhibit indicates the total volume of traffic carried on the local train: does it indicate the service that is necessary and incident to those two kinds of traffic?

A. Only as the volume of traffic itself indicates it.

Q. In what way does the volume of traffic indicate it, Mr. Wharton?

A. The volume of traffic indicates what the train carried.

Q. I understand that, but I am not talking about what the train carried. I am talking about the extra expense on account of switching of local trains. The extra expense on account of extra switching

that has to be done by local trains? Now what do you see
2562 on that exhibit that indicates to which class of traffic that should be charged?

A. There is nothing except the volume of the traffic itself.

Q. Now, Mr. Wharton, if that is the case, as you stated, how would you make known by what appears on the exhibit—and what appears there does not indicate any difference in the extent and character of switching anywhere between the two kinds of trains—why do you make an allowance of fifty per cent for switching on the local trains?

A. To get the local train expense.

Q. It seems to me you must have had in mind in making up that exhibit the sources from which that extra expense arose, didn't you?

A. No, sir; except the local train does the switching at local stations for all classes of traffic, whether state or interstate.

Q. You did not have that in mind?

A. We only had in mind the fact that it does the local switching in either case.

Q. Mr. Wharton, I wish you would give me a statement of trans-state freight that was handled on local, also on through trains, in October, 1907, on the St. Louis, Iron Mountain and Southern and the St. Louis and Southwestern Road each?

2563 A. For the Southwestern I don't believe the statistics have been worked up.

Q. Well, take first the Iron Mountain?

A. Well, I will have to go into our records and see if we have them.

Q. I think you can point that out from the exhibit here?

A. Not of the trans-state. I will of the local and through trains, is that your question?

Q. Yes.

A. No, we haven't it in any exhibits here.

Q. Will you let us have that then, Mr. Wharton?

A. If we have the figures, I will, yes, sir.

Mr. HILL: I believe it does appear in the exhibit as interstate, without carrying the distinction in it throughout, doesn't it?

A. That is correct.

Mr. MOORE: Mr. Wharton, in order that you may understand specifically what it is I want I will call your attention to it. The interstate freight carried on local trains and on through trains on the first line of that exhibit. Now I want to know what the ton miles of trans-state freight are in each one is, and what the per cent is?

A. Now that can be furnished as to the Iron Mountain but not as to the Cotton Belt.

Q. You say it cannot be furnished as to the Cotton Belt?

A. No, sir.

2564 Q. Don't your total figures show on your work sheet each kind of freight carried on those trains?

A. On the Iron Mountain, yes; not on the Cotton Belt.

Q. Then you can obtain that information from your work sheets, can't you?

A. Yes, as to the Iron Mountain.

Q. In adding fifty per cent to the engine mileage on local trains on account of station switching did you make any distinction between that part of the traffic that was trans-state and the other part?

A. No, sir.

Q. Well, do you think there is any difference between the amount of switching done for trans-state and interstate freight?

A. I couldn't say as to that on local trains.

Q. Well, what is your opinion about that?

A. I wouldn't express any, I have none as to that.

Q. You have no opinion as to that?

A. No, sir.

Q. Well, wasn't that a very important feature to know that?

A. Not as I understand between local and through train service, no, sir.

Q. Now let us see, I don't mean make a difference on the division right now between local and through trains. I mean when you go to divide expenses, like the difference on state freight and interstate freight, wouldn't it cut a figure then?

2565 A. It would in a final division between state and interstate.

Q. Did you make any allowance or give any attention to that in making your final division between state and interstate, after you had divided the expense to local and through trains?

A. No, sir.

Q. So if there was any distinction there it was not taken into your statement?

A. If there is any distinction it is not taken into consideration.

Q. Mr. Wharton, how does the volume of traffic in the month of October compare with the volume of traffic in other months separately during the period of twelve months?

A. The total amount of traffic during the month of October was heavier than it would average for the six months ended December 31, 1907.

Q. What is the difference?

Mr. HILL: Which road is that?

A. That is Iron Mountain.

Mr. MOORE: What is the difference?

A. The total volume of traffic during the month of October was in round numbers a hundred and twenty million ton miles. The six months ending December 31 amount to five hundred and eighty-eight million, or an average of a little less than one hundred

2566 million ton miles per month.

Q. What was the total ton miles for October?

A. A hundred and twenty million.

Q. That was about twenty per cent above the average? October was about twenty per cent above the average?

A. Yes, sir.

Q. How were the months of July, August and September compared with the months of October, November and December?

A. I have the statistics for the period by months.

Q. You can't separate the six months period into parts then?

A. No, not with the information I have before me.

Q. Have you any information in the details you worked up in this case that would enable you to say that?

A. I couldn't say. I don't believe we have any by month though

Q. What is the volume of the tonnage as between local and through trains in October?

A. As between local and through trains?

Q. Yes, sir.

A. You want it in figures or percentage?

Q. Perhaps both ways?

A. During the month of October, 1907, the local trains carried 11.18 per cent of the total freight, and the through trains 88.82.

Q. Read that again please?

2567 A. During the month of October, 1907, the local train carried 11.18 per cent of the total freight, and the through trains 88.82.

Q. I want that stated in train miles if you have it?

A. No, I can't state it in train miles.

Mr. HILL: Was that in ton miles?

A. It is the percentage of ton miles carried, local and through.

Mr. MOORE: Your record there shows the relation in October, doesn't it?

A. Yes.

Q. That is what I am asking about now; in ton miles.

A. Well, in ton miles——

Q. Train miles.

A. Well, I would have to work it out to give it to you in train miles.

Q. Here is it, Mr. Wharton, right there (indicating on exhibit). It isn't worth while. What is the train mile?

A. Well, the per cent of train mile, local train miles are 26.42 per cent of the total, and the through train mile 73.58 per cent of the total.

Q. How will that compare with the six months ending December 31, 1907?

A. I haven't the statistics for the six months.

Q. Have you ever looked that up?

A. I had Mr. Hamilton look it up roughly at one time.

2568 It was just worked out roughly, though.

Q. You haven't that?

A. No. My impression is that the percentage remained very close to this percentage for the whole six months, but I am not sure that is correct.

Q. You cannot state how it is?

A. No, sir.

Q. Well, now were those figures—was that basis of division worked up without that knowledge?

A. This basis of division?

Q. Yes.

A. It was worked up with a knowledge we had for October, 1907.

Q. But was it without a knowledge as to what the relation was for the six months ending December 31, 1907?

A. Yes, sir, just on general average.

Q. You didn't work it out?

A. No, sir, not closely.

Q. Wasn't that a very essential matter to know about in determining whether you could take October as a representative month?

A. Well, if there had been a large variation of the train miles I think it would have been important, but the rough figures we made up show there was a very little variation in the relative train miles.

2569 Q. Mr. Wharton, do you know whether the number of local trains is uniform throughout the year operated on these two roads?

A. No, sir, I don't know whether it is or not.

Q. You don't know whether they run one or more than one train in the month of October?

A. No, except just from general knowledge that the local trains usually run on the days they are scheduled.

Q. The point I am calling your attention to is whether there is more than one local train run at any time during the year on either of these line- of road?

A. I haven't any knowledge as to that.

Q. Well, now, you do know as a matter of common knowledge, don't you, that in the autumn down in Arkansas, that there is a very large increase in the volume of business, you know that, don't you?

A. I could tell that if I saw the statistics.

Q. I mean don't you know that as a matter of common knowledge?

A. I would not want to say that I know that as a matter of common knowledge, no.

Q. Don't you know that the movement of the cotton crop necessitates a very much larger increase of equipment and that there is great complaint down in that country in the autumn about want of railroad equipment?

2570 A. I don't know about the complaint, but I assume a great deal of the cotton crop would be moved along through the fall and winter.

Q. Now what I want to ask you is this: If you know that the increase in volume is more largely in the movements of interstate traffic than it is in the movements of state traffic?

A. No, I don't know whether it is.

Q. You don't know that?

A. Except as statistics would indicate.

Q. You haven't investigated that?

A. Not closely.

Q. Why did you divide maintenance of way and structure between local and through trains? Why did you do that?

A. Why did we divide it?

Q. Yes.

A. In order to find out the amount.

Q. I mean is that a train expense?

A. It is an expense caused by running trains; necessary for the running of trains, but not strictly an expense of the operation of the train itself. The road is kept in condition that the trains may run over it.

Q. Isn't it based on the theory that the depreciation of wear and tear to the track is caused by the operation of trains?

A. Not entirely, no, sir.

Q. Then why do you use it as a train expense then?

A. Because it is an expense necessary that trains may be
2571 operated over the road—necessary that they may be operated over the road.

Q. Now there may be—and there are—some items of maintenance of way that are not and cannot in the nature of things be attributable to the operation of trains, and yet you include them in this division, don't you?

A. What are you referring to now?

Q. What is included in maintenance of way and structure? Just tell me what you include in that?

A. Mr. Johnson's statement No. 4 shows the classification of accounts included in maintenance of way and structure.

Q. And the classes that are included in that exhibit are covered by your exhibit there, are they not?

A. All of this was covered by our exhibit, all lumped together.

Q. Well, I see there an item of flood damages, an item of general cleaning of right-of-way, an item of buildings and grounds, fences, telegraph and telephone, personal injuries, stationery and printing. Now are any of those items effected by the operation of trains?

A. They are incident to the expense of maintenance of way. The maintenance of way is affected by the operation of trains and cars, and they naturally follow the direct expense of them.

Q. But the depreciation caused by those things is not
2572 brought about by the operation of trains is it?

A. They are necessary to keep the track and roadway in proper condition, and to that extent they are.

Q. Mr. Wharton, isn't it a fact that a very large per cent of the depreciation and damage to tracks—this maintenance of the way cost attributable to the elements rather than to the operation of the trains on the track?

A. That is correct; yes, sir, I think so.

Q. Now if that is true why do you charge that as train expense? Why don't you divide that on some other basis?

A. Because the primary object is to keep the tracks and roadway in condition for the operation of trains. We have to keep up the tracks and roadway for the trains to run over, and naturally whether the expense is caused by the train itself or is necessary so the trains may run over the tracks, it seems to me it would naturally follow the use made of the track.

Q. In other words, that is on the theory of the trains have to

use the track and whatever depreciates the track must be charged to the train expense?

A. It must be charged to the account that naturally follow- those that are naturally caused by the operation of the trains.

Q. Now, you have got to have a railroad in order to do business and you have got to have traffic too?

A. Yes.

2573 Q. How did you follow the division?

A. Didn't have any particular division?

Q. Is it more essential to railroads to have tracks than business?

A. It is absolutely essential to have the track.

Q. Why did you divide a portion of the traffic expenses on the revenue?

A. There was no other basis to go by and just simply stated them in that way. There was no basis of division suggested by anybody that seemed more reasonable and that could be worked out and we simply followed that method.

Q. Now isn't it a true theory if you were going to make a division of the expenses of operation on the basis of local and through trains, that the proper way to do it is to confine it to that character of expense which grows out of the operation of the train?

A. All of the indirect expense that grows out of the direct expense follows the direct expense, whatever it may be. If the indirect expense is apportioned on one basis the direct expense is apportioned on one basis. It naturally suggests itself to follow that basis.

Q. In the exhibits you have prepared it is a direct expense?

A. In the exhibits we have prepared and in the general accountings.

2574 Q. What proportion of the expense of maintenance of way and structure is the result of wear and tear from the operation of trains over the track?

A. Well, I couldn't say as to that.

Q. Is there any charge in these accounts on account of depreciation of structures and tracks and so on?

A. I have no details of the account, but I don't remember there is as to the maintenance of way and structure any depreciation charged. Mr. Johnson may know more about that himself. I don't see any depreciation down here.

Q. Well, there is a very large depreciation there from natural causes, isn't there?

A. Yes, sir.

Q. Now you stated this morning—I mean since you have been on the stand—that your observation in regard to the charge on depreciation. Should there not be a charge made there according to the proper method of conducting business of this kind, necessary to the business?

A. Well, as to track and roadway, the railway company that keeps its property in good condition. I would hardly know just what to say as to a proper charge for depreciation. I presume there should be some charge there for that purpose.

Q. Every reason that would exist in an industrial plant would apply to a railroad, wouldn't it?

A. Well, in an industrial plant the machines wear out.

2575 Q. The machinery of railroads wear out?

A. Well, the railroad usually keep their property up in good condition, the track and the roadway; while in an industrial plant the machines will wear out, and that wearing isn't noticeable until it is necessary to replace a machine entirely by a new one, you can't repair it.

Q. At the same time it is true that there is an analogous depreciation going on not only in the track and the structure but in the machinery that is used on the railroads, that is true, isn't it?

A. I say there should be some depreciation charge.

Q. What would you estimate would be proper?

A. Well, I have not anything in mind on that subject. I would have to go into an investigation before I could make up my mind and then probably could not.

Q. I believe you said you have given this subject some study and thought, Mr. Wharton. If that is true, I suppose you know that there has been a very thorough investigation on the subject of division of expenses by the Wisconsin Railroad Commission, don't you?

A. Yes, sir; as between, I think, just freight and passenger business, however.

Q. Now, you looked up some authorities, among others Mr. Wellington. Isn't it true that the Wisconsin Railroad Commission divided that part of the maintenance of way and structure ex-

2576 penses which resulted from depreciation on the gross earnings basis?

A. I couldn't say; I would have to go and look over their ruling on that matter first to know just what their final finding was in that matter.

Q. Does your car mile basis make any allowance for the difference of weight in cars?

A. No, sir.

Q. Well, do you think that is fair, Mr. Wharton, to charge the same amount of wear and tear to every car without regard to its weight?

A. Not absolutely, no sir. I expressed the opinion that I thought the gross ton mile basis would be the best basis to use.

Q. The gross what?

A. The gross ton mile, which would include the weight of the car.

Q. Why didn't you use that basis?

A. I didn't have the information on which we could work it out, and this was the next closest to it.

Q. Then you have not adopted what you think would be the best basis?

A. Not the best basis, no, sir.

Q. Now the Cotton Belt exhibit contains that very information, don't it, Mr. Wharton?

A. It may be. I didn't look into it very carefully.

2577 Q. Look at it and see, please, Exhibit 19?

A. Yes, it gives the weight of the trains; the dead weight as well as the ton mile weight.

Q. You could then have made a division on that basis as far as that road is concerned?

A. Yes, sir, we could have done so.

Q. Well, why wasn't that rule adopted if you think that was the proper method?

A. We preferred to work both statements on the same basis.

Q. Now, there is a difference in weight growing out of another cause, cars may be empty at the initial point, and then refilling cars, or cars on local trains are lightened from station to station by unloading at those stations, are they not?

A. I presume so, although I am not familiar with that.

Q. Isn't that true with that kind of state traffic which is peddled out at local stations?

A. I wouldn't say as to that. I am not sufficiently familiar with that to pass on it. I could state that in Exhibit P, which is our Cotton Belt freight exhibit, we show the average loading of revenue on freight, both carloads and less than carloads in the local and through trains.

2578 Q. And the statement you speak having there shows a forty per cent heavier loading on through than local trains?

A. Taking a carload and less than carload together, yes, just about that.

Q. Now doesn't the report also show the gross ton miles on each train?

A. It does not, and I don't believe we had it on carload and less than carload. We didn't have the statistics on which we could do that.

Q. Well, it was not necessary to show that as far as the division between local and through trains, was it?

A. No, sir, it was not necessary to have this in either case.

Q. Then you could have made that division on the gross—did you say tonnage basis a mile?

A. Yes, sir.

Q. Which you say would have been the better plan—did you use the term gross tonnage?

A. Gross ton miles.

Q. You could then in both cases have made your division on gross ton miles?

A. No, sir.

Q. Why not?

A. We didn't have the weight of the equipment of the Iron Mountain.

2579 Q. Didn't the Wheeler report show that?

A. I don't know, I didn't see the Wheeler report.

Q. I will show you now.

A. I think the Wheeler report provided for that, but I don't know whether it is on there or not.

Q. Well, this statement of yours was made up on the basis of the Wheeler report?

A. As to the ton mile of freight and car miles, engine miles and train miles.

Q. And this division between local and through trains and the cost of maintenance of way and structure was made on the basis of car miles, wasn't it, which you obtained from his report?

A. Yes, sir.

Q. Now doesn't Exhibit 20 show that the dead weight for the local train was 120 per cent greater than the through on the Cotton Belt road?

A. I didn't see it worked out here. Mr. Kimbell's exhibit shows that the average ton miles of dead weight to each ton mile of commercial freight of through trains is 1.84 ton and on the local trains 4.9 tons.

Q. Now did you make any allowance for the difference between empty and loaded cars?

A. No, sir.

Q. And its *a*ffect upon the track, or wear and tear?

A. No, sir.

2580 Q. Your figures include empty as well as loaded cars, do they not?

A. Yes, sir.

Q. Mr. Wharton, don't you think that to get a correct division of the cost of maintenance of way on a basis of car miles, and engine miles we would have to take into account these differences in weight between empty and loaded cars, and between that class of cars which are loaded heavily and those loaded lightly, and that class of cars which begin to unload immediately from the time they start out from the station until they get to the end of the journey, which is the case with local trains?

A. If the expense were divided on a gross ton mile basis that would all be taken care of. Of course it is not all taken care of exactly on the division on a car mile and engine mile basis.

Q. Well, the reason I wanted particularly to call your attention to that, because you stated in your examination in chief that you wanted to get away from theory and get this down on a basis of actual costs. Now in view of these facts have you succeeded in doing that?

A. I think we have got it down to a very close basis of actual cost, not to an actual division.

Q. Now isn't the assumption that you make in this division by adding fifty per cent to engine miles for station switching

2581 and that every engine mile is equivalent to two and one-half car miles, a matter altogether of conjecture or guess?

A. Not altogether of guess, no, sir.

Q. Well, now, tell me the elements of certainty and knowledge that there is in it? How do you know that?

A. That was arrived at after a consultation with Mr. Hamilton and others as to about the length of time it takes a local train to make its run and the length of time that

it ought to take if the train ran through, making some allowances for each station, and the evident time—the difference between the two that would be spent in switching. We add for this about six miles an hour, which was he basis I think fixed by the Interstate Commerce Commission, amounted to about the percentage we have used here. It was just worked out roughly and we did not go into any detail on the matter. But that was the ideas we had back of the figures we used here.

Q. You were asked by counsel why you divided expenses of maintenance of way between local and through on the basis of total engine and car miles, and you stated in your answer, among other things, you believed that it was a method followed considerably by the railroads themselves in apportioning that class of expense
2582 where they have to make a division between classes of freight service.

Now, Mr. Wharton, does the railroad in any case adopt that basis for arriving at the difference between different classes of freight service?

A. I think the St. Louis and Southwestern Railroad divide maintenance of way expense on that basis on the Paragould division. I believe Mr. Kimbell testified to that, with the exception that they make no extra charge for the engine mileage; or multiply by two and a half simply dividing it on a straight car mileage basis.

Q. What part of his testimony are you referring to; that in regard to the contract between the two railroads?

A. Yes, sir.

Q. I am asking you about a division of the amount, not a matter between two railroads, one owning the property and the other leasing it from the owner, and contractural elements entered into by them. I might estimate my property as worth so much and at the same time in renting it to someone charge them on a different basis. I might charge them more or less. That is no criterion. What I am asking you, and what you undertook to give, as I understand it, was the method in which railroads divide their own accounts. Now can you point out any instance in which such a division is made on the basis of car miles?

A. No, sir, not as to division of its own accounts.

2583 Q. Did you take into consideration in making this division the extent to which the different kinds of traffic used these facilities of station buildings and house tracks and facilities of that character?

A. No, sir; we just simply took into consideration car miles and the engine miles in making this division between local and through service.

Q. I want to call your attention to the former testimony of Mr. McPherson in this case where he says trans-state freight, which is fifty-one per cent of the total freight, makes no use of station buildings, except that portion assigned for telegraph purposes, nor of house tracks where cars are loaded and unloaded, of team and public tracks where car load freight is received and delivered, nor of tracks to elevators and industries, such as mills, warehouses, coal and lum-

ber buildings, and other facilities which are provided to care for traffic either originating in and destined to points within the state.

Now was any consideration given to that in making this division by you, to the facts set out there in Mr. McPherson's testimony in regard to using the facilities by trans-state traffic?

A. No separate consideration was given to it, no, sir.

Q. Could you properly divide the expense of maintenance of way and structure in the traffic which you include, trans-state traffic, as well as ordinary interstate and local, without taking
2584 into consideration those elements, if that statement is true?

A. Well, it seems to me that they would affect the result so little as to a division of maintenance of way and structures expenses that a division on either a car mile or a gross ton mile basis would be approximately correct.

Q. And he further testified—the same witness—that the main tracks of the St. Louis, Iron Mountain & Southern in Arkansas, including second track, is 1331.5 and side-track mileage is 509.41; of this side-track mileage 114 miles consists of passing track, which are maintained on the same basis or standard as the main track mileage; the other part of the tracks represent 395.41 miles, requires 2560 ties to the mile, and renewal of these ties represented by this mileage every five years, and so on. Now that is not used by trans-state trains, he further testified. Now could a division be made on the basis you have attempted, at the cost of maintenance of way and structures, without also taking that fact into consideration?

A. It don't seem to me as if that would affect the cost in any particular, owing to the classes of freight hauled, and the two classes of service being so inter-mixed, both classes of trains using the facilities you have mentioned.

Q. Then you have a traffic in your interstate business that does not use that amount of tracks mentioned by Mr. McPherson?
2585 A. According to Mr. McPherson's statement.

Q. I am assuming that is correct.

A. There are some tracks there that the trans-state business don't use.

Q. There are 395 miles, isn't that a fact—practically four hundred miles?

A. The cost of the maintenance of those tracks I do not believe is kept separately.

Q. The point I want to call your attention to is if it was not requisite to ascertain that, make some allowance, average, in order to make a correct division that your exhibit is founded on?

A. No, I don't believe it would be necessary to make any allowance for that. It would be impossible to determine just what proportion of the cost should be allowed for that purpose, if any.

Q. Well, isn't the trans-state freight charged, under your method, the same relative proportion of the cost of maintaining station buildings, house tracks, team and public tracks, tracks to industries, miscellaneous buildings, and this part of the side-track which is not used by trans-state trains at all, as is charged to the cost of handling interstate freight traffic?

A. Yes, sir; on each class of service charged the trans-state has its share of the expenses.

Q. There is a character of traffic there that you are charg-
2586 ing on facilities that it doesn't use, isn't that true—I mean the cost of maintenance facilities it doesn't use?

A. If Mr. McPherson's statement is correct, there is a small expense there that is being charged to the trans-state that that service does not use.

Q. Now tell us what the size of that item of expense is?

A. I don't know.

Q. You have no means of knowing either, have you?

A. No, sir.

Q. And you really don't know whether it is large or small do you?

A. No, sir; I just assume from the nature of the expense that it isn't very large in comparison with the whole expense, but that is just an assumption on my part.

Q. Mr. Wharton, I believe you made an affidavit that was filed in this case at the hearing before Judge Vandeventer in St. Paul on the application for an injunction, didn't you?

A. Yes, sir.

Q. And in that affidavit you stated, did you not, that the ton mile basis was a proper method of division, and had no reference to the division between local and through trains?

A. Yes, that is correct.

Q. Didn't you also file in connection with that affidavit a letter from Haskins and Sells to the Attorney General of Missouri
2587 which contains the following statement:

"For the reasons given above, we consider that the ton mile basis is the most correct basis for the division of the expenses of maintaining ways and structures, and these reasons are also considered sufficient for the statement that there is practically no difference in the cost per ton mile of such maintenance, whether it be for through, inter-state, second class interstate or state"?

A. Yes, sir, I presume that is in the letter to Mr. Hadley. I have no particular recollection of it now.

Q. Your recollection then was that the ton mile was the proper manner of dividing this expense?

A. Yes, sir.

2588 T. F. WHARTON—cross examination resumed.

By Mr. MOORE:

Q. Mr. Wharton, in your division of the cost of maintenance of locomotives, you have added 50% to the mileage made by yard locomotives to provide for cost of extra maintenance due to the yard service:

How did you arrive at 50% as a proper allowance to make?

A. That was just approximated at that. We had no definite basis to use for that purpose, but in consultation we decided we would add that amount as representing the possible extra expense of that.

Q. That was an assumption?

A. That was an assumption, yes, sir.

Q. Then you have added 50% to the mileage of road locomotives in local service, to provide for possible extra switching mileage: how did you determine the percent to be added on that account?

A. Well, that is the same percentage that was used under the head of "Maintenance of way and structures", as I explained
2589 yesterday in talking about local switching.

Q. It was on the same assumption as it was in the case of "Maintenance of way and structures?"

A. Yes, sir.

Q. And the additional 50% you have added to the switching mileage of the local train engines to provide for the possible extra maintenance due to switching service, was reached in the same way, I suppose?

A. Yes, sir, as just explained about the switching engines.

Q. Now, Mr. Wharton, you have stated that those were mere assumptions; that you did not have any data from which you could make any percent based upon facts known to you?

A. No, sir, no known facts or figures to work it on.

Q. The extra mileage that you have allowed in the way you speak of in the matter pointed out, amounts to about 118,000 miles, I believe—at the top of page 2—and that is nearly 50%, is it not, of the total mileage, between 40 and 50%?

A. You mean the total mileage exclusive of——

Q. I mean about 25% instead of 50%.

A. Almost.

Q. I have it worked out here. It is 23%.

A. I expect that is about right.

Q. So, you have added to that mileage in making your division practically 25% upon assumptions which were based
2590 upon unknown facts: is not that the case?

A. Unknown figures and data, but I don't know that the absolute facts would be unknown.

Q. What did you have? You said a while ago you had no facts.

A. When I said that I meant visible facts. What we had was simply the result of conferences among ourselves and with some railroad men.

Q. And they were simply assumptions?

A. They were assumptions based on those conferences and the knowledge that those people had about the matter.

Q. How is this expense divided between freight and passenger service? It is on the revenue train mile, is it not?

A. I don't believe it is (referring to paper). Yes, the common maintenance and equipment expenses are divided on train mile basis, between freight and passenger business.

Q. Mr. Wharton, is it not a fact that all engines are used interchangeably between freight and passenger service; that an engine may be today in yard service and tomorrow in road service; today pulling a freight train and tomorrow pulling a passenger train: is not that true?

A. I couldn't say as to that.

Q. You do not know about that?

A. No, sir.

Q. Well, assuming that it is true, should not this extra allowance of 75% that you have made, have been made before the di-

2591 vision between freight and passenger?

A. No, I cannot say that it should have been. The railroad company did not see fit to do so.

Q. The railroad company did not make this extra allowance either, did it?

A. No, sir. They testified to various matters of that kind in the testimony.

Q. The railroad simply divided the total cost of locomotive engines between freight and passenger, on the revenue train miles, did it not?

A. Yes, sir, which practically means the engine miles also.

Q. Does that mean engine mileage?

A. Practically, as I understand it. It may not mean absolute engine miles, but as I understand train miles and engine miles, there is very little difference.

Q. Have you acted on that assumption in making up these figures?

A. No, sir, I have not acted on any assumption in regard to that at all.

Q. Was it not necessary for you to know the difference and distinctions between these bases upon which estimates of that kind were made?

A. It was necessary for us to know the train miles and to know the engine miles, which are shown in our statement.

Q. You say you followed the railroad company's method: that was to divide on a basis of revenue train miles the total expense?

2592 A. Not the total expense, no, sir.

Q. I am speaking of locomotive maintenance: if you did not do it, tell me where you deviated from that, because it is my understanding that you did.

A. All expenses of a common nature are divided upon a train mile basis, but whether that included all the maintenance of engines, I don't know.

Mr. HILL:

Q. Are you speaking of maintenance of way or maintenance of equipment?

A. Maintenance of equipment.

Mr. MOORE: I am speaking of this branch of maintenance of equipment. It is divided into several branches. Locomotive maintenance is the one I am speaking of, now.

Q. You stated a moment ago that you followed the division made by the railroad:

The question I have just asked you was if the railroad company did not divide the cost of maintenance of locomotives upon the basis of the revenue train miles, total cost?

A. I stated that all common expenses of maintenance of equipment are divided that way, and I did not know——

Q. If you intended to follow the railroad company's division of operation, the total cost, should you not have made your extra allowance before you made the division between freight and passenger?

A. No, I did not consider that necessary.

2593 Q. If you were trying to act consistently with the action taken by the railroad company, you would have endeavored to do that, would you not?

A. That is a matter that I will have to give considerable thought before I can say definitely just what I would have done.

Q. Now, to go back: If it is true, as I suggested in a question a while ago, that these engines are used indiscriminately in hauling freight and passenger trains, should not this allowance have been added before you made the division between freight and passenger?

A. No, I hardly think so.

Q. Can you give me any reason for your view about it?

A. Well, the only reason I have on the subject is that if the engines are used indiscriminately, they are also used in the passenger business between local and through service, and, perhaps, switching; and that the average on both sides, freight and passenger, would probably be about correct as divided by the railroad company.

Q. Is not that the very best reason for adding your arbitrary before you make the divison?

A. No, I could not say so.

Q. That is the reason I have in my mind for thinking so, and I might say, it seems to me that that is a conclusive reason why you should have added your arbitrary before you made the division.

2594 A. It does not seem to me so. It seems to me that the reasons I gave would be sufficient not to disturb the division they had made.

Q. You made no allowance for difference in size and weight of engines, did you?

A. No, sir.

Q. Or the difference in the kind of trains they pull?

A. No, sir.

Q. You put them all on a level?

A. All on a level.

Q. Now to go back to the question I asked you a while ago: the expense of maintenance of yard locomotives is divided between local and through service on the basis of the number of cars of each class of service handled by yard engines during the month of October, 1907, on the exhibit relating to the Irion Mountain, and the month of October, 1908, in the exhibit relating to the St. Louis Southwestern Railway:

How did you arrive at the total number of cars handled at terminals?

A. As I explained in my testimony yesterday, we took the total

number of cars shown by the wheel reports as going into the terminals, and the total number of cars shown by the wheel reports as going out of the terminals, for all the terminals where yard engines were maintained during that month, on both roads.

2595 Q. In dealing with that proposition, you counted every car that went in and every car that went out of a terminal?

A. That was the idea. I think that is correct.

Mr. HILL: As I understand it, that answer was correct so far as it went, but it is not complete. I want to call on Mr. Hamilton on that. I do not want to get it mixed up.

Mr. MOORE: Do you want Mr. Hamilton to make a statement of that now?

Mr. HILL: Mr. Wharton's answer is correct so far as it goes, but it is not a full explanation.

Q. (To Mr. Hamilton:) Will you please explain that, Mr. Hamilton?

A. It is just this: In working up that data we found that in a great many cases a switch engine was maintained at an intermediate yard, that is, a yard between the ends of the through freight train's or local freight train's run. We did not count the entire consist of the train into the intermediate yard and out again if it went through that yard, but only the cars set out or picked up there at the intermediate yard.

Mr. MOORE:

Q. Did you do that on all trains, both local and through, on the basis of all the wheel reports?

A. Yes, sir, all trains for the entire month; both local and through.

Q. Referring, now, to the month of October, 1907?

2596 A. Yes, that work was done by myself and assistants on the Iron Mountain, and by my assistant, jointly with an employé of the Cotton Belt, on the Cotton Belt road.

Q. How many terminals did you have?

A. I have not the data here, but the points we called terminals were taken from the list furnished us by Mr. McPherson. I have the list.

Q. When did Mr. McPherson furnish you that?

A. I have not the exact date.

Q. Do you mean his testimony on the stand or off the stand?

A. No, a list given us at his office at our request.

Mr. MOORE:

Q. (To Mr. Wharton:) Mr. Wharton, what is the local and through car mileage shown on your exhibit "I," in the month of October, 1907, on the Iron Mountain road?

A. The local car miles, freight car miles, are 1,112,865.

Q. That is your number of local car miles?

A. Yes, sir.

Q. What was it including cabooses?

A. Including cabooses it was 1,173,350, on the local trains.

Q. What was the average number of local cars moved in that month as shown by this exhibit?

A. Do you mean per train?

Q. No, the average number of local cars?

A. Well, it gives the average number of cars per train. The number of cars moved was 1,173,350.

2597 Q. That is car miles?

A. Yes, sir.

Q. I am asking you the number of cars moved during that month, as shown on this exhibit I, in the local service.

I will call your attention now to the statistics shown on that exhibit: "Average number of cars per train" is given there, and the "Number of trains run": Now, it seems to me you can ascertain that very easily by multiplying the average number of cars per train by the number of trains run—16.6 cars per train and 1,116 number of trains run.

A. Based on the average number of cars per train and the number of trains shown here, the number of cars would be 18,525.

Q. In the through service, your statistics show the average number of cars per train to be 33.2; and the number of trains run to be 2,758:

Give me the number of cars on through trains?

A. The number of cars run on that basis would be 91,565.

Q. Now, Mr. Wharton, if you divide this number of cars into the number of car miles that will give you the average haul?

A. Yes, sir, I think it would.

Q. What would that work out on local trains?

A. I did not work it out finally, but it would be about 60 miles on local and 70 miles on the through.

2598 Q. Now, Mr. Wharton, is it not a fact that all the cars on the local trains run the full distance of the trains? Do you assume that to be a fact?

A. No, I do not assume that all the cars that they haul are hauled the full length.

Q. If your average length of car haul is 60 miles for local service—that must be the case if your statistics are correct, because I call your attention to Exhibit "I," where you say the average length of run of trains in miles is 63.2 miles—if your car mile run is 60 miles and your train run is 63.2 miles, your cars—each car in the local train—must run about the same distance that the train does.

A. On the basis of the figures you are using that must be so.

Q. Do you think that is possible, Mr. Wharton?

A. No, sir, it is not possible.

Q. The same result would obtain in regard to the relation of car runs and train runs in through service; you say it is about seventy miles, the average length of run in miles on through trains: as stated in your statistics, it is 78.8 miles.

A. Yes, the point of that is this: in getting this average number of cars we do not get the actual number of cars handled by the

train for the reason that the local train, while it distributes cars as it goes along, also picks up cars, and goes into a terminal with practically the same number of cars it would leave with. So it would handle more cars than would be indicated by this figure.

2599

Q. If that explanation is correct, your statistics here, where you undertook to give the average number of cars per train, do not in fact give it, do they?

A. Yes, they give the average number of cars per train.

Mr. HILL:

Q. Per train, or per train mile.

A. Train mile.

Mr. MOORE:

Q. I say the average number of cars per train. You cannot switch it over to train miles.

A. That would be the average number of cars per train, just the same.

Q. If the average number of cars per train are shown to make an average run of sixty miles, it seems to me that that means that the cars average that: it cannot mean anything else but that each car averages that.

A. Not that each car averages that; not each car, but as a whole.

Q. The number of cars you have is 16.6, local service, multiplied by 1116 trains.

A. Yes, sir.

Q. That gives you your number of cars: now, you have the car mileage that you worked out there and it seems to me that that, if it means anything, means that the average run of a car is 63.2 miles.

2600

A. No, sir.

Q. That is what you said a moment ago when I asked you what that would be.

A. The average run of the cars that are in the train would be that much, but, as I say, they drop out cars and they pick up cars; the average car does not run through from the beginning to the end of the run. The number of cars——

Q. Mr. Wharton, on that basis, then, in order to get an average of 63.2 miles, would you not have to assume that many of your cars on a train run, run a very much less and many of them a very much greater distance than the average run of your train? The average run of your train is 63 miles: can you make that assumption that you run cars a much greater distance than the average run of your trains?

A. No, sir.

Q. Then you cannot work out that theory, it seems to me.

A. We cannot work out the theory that the train handled only 18525 cars. We can work out the theory as expressed here. This statement made here is correct, but when we say the train handles only 18525 cars that is not an exactly correct statement.

Mr. HILL:

Q. Why is that not correct?
A. (No answer.)

Mr. MOORE:

Q. How did you get the average number of cars per train?
2601 A. By dividing the train miles into the car miles.
Q. Do you not think, Mr. Wharton, from the testimony in this case and the investigations you have made, that the average number of cars in the local train exceeds 16.6?
A. I have nothing to go on except the figures we worked out on that.
Q. But what do you think about it?
A. I do not imagine that they exceed much more than one half the cars on a through train.
Q. Mr. Wharton, do you know if the expense of repairs to locomotives is included in the common accounts under "Maintenance of Equipment" or not?
A. I expect that on some roads they are. I think some roads make an effort to keep them separately.
Q. But I am speaking about this case. I do not want to know about any other roads just now than these two, the Iron Mountain and the Cotton Belt.
A. Yes, sir, I think they are included.
Q. Do you know, Mr. Wharton?
A. The accounts would indicate that in the statement filed by the Railway Company.
Q. Can you not answer the question more definitely than that, Mr. Wharton?
A. No, I would not care to without looking into further data on the matter, Mr. Moore.
Q. In the division of expenses of maintenance of freight
2602 cars you have set apart 21.5 per cent on account of the expenses of stopping and starting at way stations, and 13.5 per cent on account of terminal handling, on the authority of one, Mr. A. M. Wellington, who wrote a book on "Railway Location:" do you know when that book was written?
A. It was probably first written about 1887.
Q. It has been revised since, has it not?
A. I believe so.
Q. Has there been any revision made of those figures?
A. I cannot say. I did not see the original publication.
Q. Well, there has not in point of fact, Mr. Wharton, and I want to ask you if there have not been great changes in the methods of railroad operation, as well as accounting since 1887.
A. Yes, sir, there undoubtedly have been.
Q. Have not the views of railroad men upon that line of subjects undergone modifications and changes in the last few years?
A. I could not say as to that.
Q. You do not know about that?
A. No, sir.

Q. Have you any information bearing on Mr. Wellington's means of knowledge and competency to deal with subjects of that sort?

2603 A. My undersanding is that this is a standard work among engineers; that is the only means I have of knowing.

Q. You do not know anything about the author's experience?

A. No, sir.

Q. In using those figures, Mr. Wharton, set up some twenty three or twenty five years ago, you do not make any allowance for changes in the methods of operation, do you?

A. Not since then, no sir.

Q. Now, after deducting about 35 percent (under Mr. Wellington's authority) you go on and assume that each car in local service receives two terminal handlings: therefore, you say "To each terminal handling of a car in through service, the local service should be charged with two times as much as the through service":

You were asked yesterday if trans-state freights were not carried on local trains to some extent and you said you could not answer. I asked you to look it up and tell me this morning: are you prepared to answer that question now?

A. Yes, sir.

Q. What did you find?

A. I found that 2,224,437 ton miles of trans-state freight were handled on local trains during the month of October, 1907.

Q. Did you charge that tonnage with terminal expenses

2604 in this exhibit?

A. Yes, sir.

Q. Do you think that is fair, in view of the testimony in this case as to the manner of handling trans-state traffic?

A. Well, I am not familiar with just the method of handling the trans-state traffic that was on the local trains, so I cannot answer.

Q. Then you do not know whether your basis is fair or not?

A. As to trans-state I would not know without going——

Q. Yet you have brought it here as the fairest and nearest approximation to an actual division, have you not?

A. Yes, sir, and so consider it now.

Q. I observe that you made an allowance for two terminal handlings in the local service on the St. Louis, Iron Mountain & Southern Railway and for four terminal handlings on the Cotton Belt Railway, and you have charged the local service on the Iron Mountain exhibit with two times as much as through service and on the Cotton Belt you have charged four times as much. Why did you do that?

A. On account of the difference in the average run of local trains on the two roads.

Q. Explain what that difference is, please.

A. On the Iron Mountain the average run of the local train is practically the same as the average run on a through train

2605 On the Cotton Belt the average run of the local train is just a little over one half the average run of the through train.

Q. As I understand it, you are now dealing with freight cars?

A. Yes, sir.

Q. And you are endeavoring to ascertain the cost of maintenance of freight cars and you make this allowance of a difference of terminal handling in and out of stations because of the character of the traffic?

One class of cars, the cars in local service, would be likely to be handled more frequently than the cars in through service: that is the basis, is it?

A. That is the basis.

Q. On each of these roads do you not deal with that problem on the basis of the service of the car? Is not that the foundation of your figures here, the service—I mean, the expense imposed upon the corporation in maintaining its cars, growing out of the use of the cars in this terminal service?

A. Naturally, the cars are maintained so they can be used in both local and through service.

Q. Now, to put it a little differently: if each car is handled in the terminals to which it is assigned—if it is local—at the beginning and the end of its journey?

A. Yes, sir.

2606 Q. Does it make any difference whether the journey is long or short, a long haul or a short haul?

A. Not as to one single run. It would if it ran over a division point.

Q. If the average run of a local train is ten miles and of a through train twenty miles, each one of those cars receive the handling that will attach to it at the beginning and end of its run?

A. Yes, sir.

Q. Without regard to whether it is a short or a long run?

A. Yes, sir.

Q. How can you by any possibility make a distinction? Explain that distinction that you have made.

A. On the basis of a car mile the element of distance, of course, comes in, and the assumption that a car mile is the same as one car a thousand miles, or one thousand cars one mile——

Q. You are not basing this——

Mr. HILL: Let him finish.

A. All cars, as I understand it, in the local service—and this was the basis of the figures we worked out on the Iron Mountain—start out with the terminal handling at the beginning of their run and a good many of them will be dropped out along the run.

Other cars will be picked up during that run and carried
2607 through the terminal to the end of the run.

So, taking the train as a whole, the cars in that train have been handled two times, or rather, four times, where the cars in a through train going through there would be handled only two times; taking the trains as a whole, or the mileage as a whole.

Mr. MOORE:

Q. We are not dealing now with car miles, but with the number of cars handled.

A. We were dealing with car miles in this case. We are applying our division to car miles.

Q. Let me read what you say: "Assuming also that each car in local service receives two terminal handlings (that is, on the Iron Mountain, and four on the Cotton Belt) including handling at local stations, to each terminal handling of a car in through service, the local service should be charged" and so on:

You are dealing with the individual cars there. I know you divided the expense later on, on train miles, but you are dealing there with the individual cars.

A. With individual cars as relate to the cars hauled by a train. A train starts from one point and goes to another. The cars we deal with are the cars in that train. The cars in that train, as a whole, are handled in the ordinary method of operation (as I understand it) on a local train twice, while the cars in the through train would be handled in those propositions.

2608 Q. You stated it twice, but I will ask you again: how you arrive at the number of cars handled into and out of terminals.

A. By counting them from the wheel reports.

Q. So it is not a matter of train miles. It is a matter of actual count?

A. In and out of terminals.

Q. And then you assume that, in order to equalize the expense growing out of the service, you doubled the number of cars that you Counted.

A. Not the number of cars we counted.

Q. You assumed that each car in local service received two terminal handlings: the local service, therefore, would be charged with two times as much as the through service. That means that you doubled the number of local cars. You cannot charge it without doubling that.

A. Doubling the local car mileage?

Q. No, you get the miles later on, Mr. Wharton.

A. No, I do not see it that way. We double the local car mileage only in proportion to the mileage those local cars travel. As I understand it, they do receive nearly twice the handling the through cars receive in making the same mileage.

Q. Maybe I am mistaken. It impresses me differently, but I am glad to have your explanation of it.

2609 In ascertaining the number of cars in and out of terminals, did you distinguish between empties and local cars?

A. Not in the figures we have used here, no, sir. We took all cars in and out of terminals.

Q. It is a fact, is it not, that there is a much larger percentage of empty cars in the intrastate movement and local trains, than there is in through trains?

A. I think that it is a fact in local trains there are more empty cars in proportion to the cars handled than in the through trains.

Q. Didn't the method you adopted disregard that fact, Mr. Wharton.

A. No, sir, not that I can see.

Q. Now, let us see with a view of ultimately ascertaining the expense of conducting intrastate as against interstate traffic: you take up this item of expense of keeping cars in repair: in order to arrive at it you count cars that go into and come out of terminals. You count empties as well as loaded cars.

For illustration, there were five hundred empties in local service and two hundred and fifty in through service, in the month of October 1907, and you charge that—I am not speaking about which way it will work out—but you charge that without any discrimination as between the loaded and the empty, to the class it would be assigned to in your division.

A. In the maintenance of freight cars?

2610 Q. Does it not derange the application of your formula, that is this part of your formula as to the ultimate result?

A. Not that I can see. I cannot see how it would.

Q. Now, going next to the traffic expenses: you divide them I believe, on a straight revenue basis?

A. Yes, sir.

Q. Why did you do that, Mr. Wharton?

A. We had no other basis that we could work up that would give us a result on that.

Q. Do you term that a "direct" or an "indirect" expense?

A. Well, I suppose a good portion of the traffic expense is a direct expense of securing traffic.

A portion of it is an indirect expense of the total traffic expense.

Q. You state in your testimony in chief, that it might be possible to get a closer approximation of the traffic expenses if proper statistics were kept as to the freight that is influenced by the solicitors and other traffic men. In the interest of railroad accountants, I will be glad if you would tell how we can compile those statistics.

A. I would have to go into the office and study the situation more. I will tell you what I had in mind then: the claims made by the traffic men themselves, over the country, as to the traffic they influenced; the filing of reports by those men—that is what I had

2611 in mind. Those statistics would not be exact, but they would represent the claims of the traffic men at least as to what they thought they had influenced.

Q. What items enter into "Traffic Expense"?

A. Aside from the supervision there are the foreign agencies, advertising, stationery, and printing.

Q. Do those heads include salaries and expenses of freight traffic managers and freight office force, do you know?

A. The classification of accounts of the Missouri Pacific-Iron Mountain Railway provide this as to the superintendence: The amount includes pay of freight traffic manager; assistant freight traffic managers; general freight agent; assistant general freight agents, and other officers in the freight traffic department.

Q. That includes their office force, too?

A. The pay of clerks, chief clerks, and porters.

Q. Also industrial agents and division freight agents?

A. I would have to depend on their word for that. I do not know, but I presume it does.

Q. Do not the labors of those officials have a great deal to do with the conducting of intrastate traffic in the State of Arkansas?

A. Well, I am not sufficiently able to pass on that, Mr. Moore.

Q. If it does, it is chargeable to State business, is it not?

2612 A. Yes, sir; any portion that would be applied that way, of their time and their effort and their expense.

Q. Just as an illustration: you know from your connection with this case, probably, that a great many of the forces that have been enumerated as coming under that head, have been at work for a long time in connection with the development of the testimony in these cases:

Do you not think it is fair that that should be charged to the intra-state business of Arkansas?

A. Not all of it.

Q. Do you think any part of it should?

A. I imagine a small part of it should be charged up to the state business, but how much I do not know.

Q. Why do you say a "small part"?

A. Because I do not imagine that even in the building up of the industries there it would result in a very great increase.

Q. The matter involved in this litigation is the intra-state rates in Arkansas.

A. Yes, sir.

Q. That is the whole matter that is involved, is it not?

A. Yes, sir.

Q. And yet you say that a small part of the expense incurred in this litigation should be charged to that intra-state traffic?

2613 A. I did not understand you were talking about the expense in this litigation. I understood you were talking about the expense of these men in developing the state of Arkansas. I was mistaken about——

(Question read.)

Q. You understand the question now: what do you say?

A. I should say if any of this expense was included in the items here, it would be chargeable to the State of Arkansas, but just how much to the state business I cannot say.

Q. You said "charged to the State of Arkansas": my question was whether it would not be chargeable to the intra-state traffic in the State of Arkansas.

Mr. Wharton, my question is not with reference to how the expense of this litigation shall actually be charged. It will, perhaps, have nothing to do with the issues involved in this case:

I am asking you these questions for the purpose of getting the views on which you, as representatives of the state accountants in this case, acted in your division of expenses.

What I want to know is, is an expense of that character (I merely mention this case to illustrate, not as affecting any issue involved in the view on which you acted, properly chargeable to intra-state traffic in Arkansas?

2614 A. If I understood you, you are simply referring to the work of traffic men, or any other official, in connection with litigation of this kind.

Q. Yes, anybody——

A. Well, in view of the fact that it is an action of the roads themselves attacking existing rates, I do not know whether it is properly chargeable to intrastate rates or not.

Q. Under the head of transportation expenses you have "station expense": I wish you would state first what you include in "station expense."

A. We have included station service, station supplies, telegraph and telephone operation, and station policemen.

Q. You have divided the expense between intrastate and interstate business on the basis of the number of tons of each class of traffic, assuming that each intrastate ton was handled twice and each interstate ton once: is there service of that character rendered to trans-state freights?

A. I am not familiar enough with the handling of trans-state freight to say, Mr. Moore.

Q. If there is not, or if there is a less amount of service based under this head, which is not attributable to trans-state freight, would it be proper to charge that with the same amount of station expense as the other interstate freight which is distinguished from the trans-state?

A. There is so much interstate freight that is handled two and three and four times that it seems to me that in taking the
2615 whole interstate freight and considering that it was handled once, including the trans-state, you are doing no injustice at all to the interstate.

Q. You have acted on that principle, then?

A. Somewhat, and we were guided somewhat too, by Mr. Doddridge's testimony in the case as to the handling of freight.

Q. Didn't Mr. Doddridge state in his testimony in this case that doubling the state passenger and adding that to the total interstate passenger, was charging too much to the interstate traffic and that the same thing applied to the freight traffic?

A. I think he said that, but rather qualified it; he thought it might be a fair method.

Q. After his attention was called to it he stated that?

A. I think he said it might do a little injustice to the interstate basis, but after all he thought it was a fair basis. That is my recollection. The testimony will speak for itself on that point.

Q. I do not think you will find that Mr. Doddridge supports you in that.

Now, this station service includes the labors and service of the agent at the station, does it not, and the cashier, stenographer, clerks, collectors, bill clerks, platform foreman, truckmen, scale men, sealers, car men, receiving men, delivery men, weigh-masters,
2616 warehouse men, and so on: the services of all of those man are represented in this item, are they not?

A. It does include those.

Q. The point I want to get at is: you do not think any of that character of service is applicable to trans-state traffic, do you?

A. I stated that I do not know just what station service the trans-state business did receive, so I could not say, Mr. Moore.

Q. What does "yard and terminal expenses" include?

A. It includes yard supervision, yard men, yard engine men and firemen; fuel for yard locomotives, yard enginehouse men; operation of fuel stations for the yard service; water supply for yard locomotives; stores for yard locomotives; other supplies for yard locomotives; yard signal men; yard policemen and yard signal supplies.

Q. These expenses are divided between local and through business on the basis of the number of cars handled at terminals, are they not?

A. Yes, sir.

Q. Have you made the same allowance for terminal handling of cars there that you did under the head of freight cars, to which I called your attention a while ago, where you made an allowance of two terminal handlings in local service to one terminal handling in the through service on the Iron Mountain and four on the Cotton Belt? Does that apply to this? I am asking for information; I do not know.

2617 A. No, sir, it does not.

Q. Mr. Wharton, is it not a fact that there is more terminal service rendered to the cars in local trains, in the manner in which those trains are handled, than there is in through trains?

A. I am hardly qualified to pass on that point.

Q. Was that discussed by you and your associates in adopting this basis of division?

A. That was discussed, yes, sir.

Q. Did you give no consideration to that feature of it?

A. Yes, that was given a great deal of consideration.

Q. Did you come to the conclusion that there was no difference in the cost of the amount of service rendered as between local and through trains?

A. As to the cars handled at terminals where yard engines were maintained.

Q. In making up this statement, you disregarded any claim that might be made for extra expense in handling cars in local trains?

A. Yes, at these terminals.

Q. Tell me just what you mean by saying "these terminals."

A. As distinguished from the cars handled by the local train itself between terminals. That is taken care of in local train expense.

Q. Assume that a train hauling fifteen cars comes into a

2618 station—we will say Hoxie—and it is handled in the ordinary way that a train of that kind is handled—it pulls in and then goes out: how many handlings do you charge to the cars in that train?

A. We charge the handling in and the handling out as figured here.

Q. In other words, you charge two handlings to the cars in that train?

A. Yes, sir.

Q. In making your division of the cost of fuel under the head of "Fuel and locomotive expenses" you were governed by the test made on the St. Louis Southwestern Railway to October, 1908, were you not?

A. Yes, sir, we followed that test.

Q. In that you covered all locomotive supplies did you not?

A. We cover locomotive supplies in our figures.

Q. Fuel, water, and so on?

A. Yes, they were not included in the test on the Cotton Belt, they only included——

Q. To have that clear, I will ask you that question: what do you include in this head of "Fuel and Locomotive expenses"?

A. We include fuel; operation of fuel stations; water supply for road locomotives; stores for road locomotives, and other supplies for road locomotives.

2619 Q. All of that expense is divided in your formulas used in each one of these cases, on the basis of the test that you say was made on the St. Louis Southwestern Railway in October, 1908?

A. It is applied here on an engine mile basis, using that test as a basis for making it; yes, sir.

Q. Did you have any information in regard to the similarity or dissimilarity in the conditions that existed on the St. Louis Southwestern Railroad in October, 1908, and October, 1907?

A. I think Mr. Doddridge gave some testimony as to that.

Q. I wish you would turn to that if it has any bearing on this.

A. (Witness producing volume:) It is in volume 2, pages 106 and 107 of the printed record.

Q. Just read that part of his testimony that you refer to in the record, please.

A. Do you want me to read the whole of it?

Q. What you relied on.

A. I relied on all of it that is set out here.

Q. You stated that you thought Mr. Doddridge's testimony justified the assumption that the conditions which existed on the St. Louis Southwestern Railway in October, 1908, bore such similarity to the conditions which existed in the preceding year, 1907, as to justify the application of that test to the earlier period:

2620 In the testimony you have referred to, at pages 106 and 107 of volume 2 of the printed record, was Mr. Doddridge not referring to the correctness of applying a test made on one road to another road? For instance, the test made on the Cotton Belt to the Iron Mountain? Was not that the matter to which he was referring to instead of the application of the test made at one period to a period of another year?

A. I cannot say as to that. I gathered the impression from his testimony that he considered the relative fuel consumption on the Iron Mountain, local and through, practically the same as on the Cotton Belt, local and through, as shown by this test.

Q. Upon what data do you base the assumption in dividing these "engine house expenses" that the local engines require twelve per cent more engine house service per engine mile than a through engine?

A. On the basis of the average length of run of the local and through train.

Q. Please turn to those per cents and tell me what they are.

A. The average length of local is sixty three and of through it is seventy one.

Q. As appears on Exhibit "I"?

A. Yes, sir.

Q. And you base it on that?

2621 A. We base it on that.

Q. What is included in "engine house expenses"?

A. Just engine house expenses. Just the one item of engine house expenses. This is the road engine house expense and not any yard engine house expense.

Q. I see in dividing expense of "road engine men and train men" you have taken actual figures: how did you get that; that is, how did you get the local and how did you get the through?

A. Mr. Hamilton worked that and I am not familiar with the detail.

Q. You do not know?

A. No, I would rather that you ask him about that.

Q. You adopted the percents that you found on application of the statistics for October of 1907, on the Iron Mountain?

A. To the six months we did.

Q. How did you get it in regard to the St. Louis Southwestern Railway? Did you use the actual test made by that road?

A. In October, 1908; yes, sir.

Q. Mr. Wharton, what is included under this head of "other train expenses"?

A. Freight car lubrication; train supplies; road signal men; highway crossing watchmen; signal supplies, road; clearing wrecks; injuries to persons; stock killed and damage to property; operation of joint tracks; flood damages; operation of stock yards and

2622 elevators; highway crossing supplies.

Q. Do not the items of "injuries to persons," "stock killed" and "damage to property" constitute a large proportion of the total of that class of expense?

A. Yes, sir.

Q. It is about 73 percent, is it not?

A. No, it would not be quite that much, Mr. Moore. You just said injuries to persons, damage to property and stock killed?

Q. Yes.

A. It is about 57 percent.

Q. You say it amounts to 57 percent?

A. Yes, sir.

Q. Could not that have been worked up—referring now to that part of the expense which consists of injuries to persons; stock killed and damage to property—and charged to local and through trains

just as conveniently as you did in the next item of "loss and damage"?

A. Well, I am not familiar with their method of handling those accounts, so I cannot answer.

Q. You cannot answer as to that?

A. No, I cannot.

Q. Can you assume, reasonably, that the amount and value of stock killed during the month of October; persons injured;
2623 or damage to property, would be any criterion as to what the amount would be in another month?

A. This is the amount for six months. I should say that it would not be any criterion as to what would happen the next month, but I presume the claims average up pretty well about the same amounts.

Q. Is not that a character of expense that is divided on the actual fixed and located charge; is it not a charge easy of allocation?

A. I should think a great many of the charges would be, but, as I say, I am not familiar enough with their handling of accounts to answer that.

Q. In "loss and damage to freight" the very next item, you based your division on the actual claims paid during the month of October, did you not?

A. Yes, sir.

Q. And yet the same items, practically, under the head of "other train expenses" you divided between local and through in proportion to the train miles for each class of service?

A. Yes, sir.

Q. Why did you not treat them alike?

A. We had no particular difficulty in getting at the loss and damage claims, but we assumed we would have considerable difficulty in making any segregation of the other expenses.

Q. You did not have the courage to tackle that problem?
2624 A. We did not have the courage to tackle that.

Mr. HILL:

Q. Just to save re-direct, I wish to ask Mr. Wharton what percentage this particular claim would amount to.

A. It is about two and one half percent of the total operating expenses.

Mr. MOORE:

Q. What do you include under the head of "supervision and general"?

A. Superintendence; stationery and printing; rents of buildings; and incidentals.

Q. Explain to me why you have applied those expenses under that head on the basis of direct charges, local trains, through trains, intrastate traffic and interstate traffic.

A. Well, the theory is that the supervisory expense, the general expense which goes with the supervisory expense, more nearly follows the direct expense, any particular direct expense, than it follows anything else. It is the measure of supervision that is neces-

sary for the expense that precedes it. That is an accounting principle that is frequently applied on expenses of that nature.

Q. How did you distinguish between that part of expense which you have applied to train costs and that part which you have applied to other costs?

A. Just as given in the methods explained before: under the head of each one of those sub-items.

2625 Q. That is to say, you assume that some are a direct charge applicable to train cost and others a direct charge applicable to traffic: is that what you meant?

A. Yes, sir.

Q. Tell me what you mean by that term "direct expense" and "indirect expense": I would like you to explain that.

A. The term "direct expense" as it is used in here, means the expense applied on one basis or another, the one that seemed most just to us, or the one that has been suggested by the testimony. That is what the term "direct expense" means in this exhibit.

Q. Let us take it in its application—because it is used in all these divisions—its application to "maintenance of equipment":

Under your sub-headings you speak frequently of direct expenses and indirect expenses, and you adopt a different basis of division, too, in regard to that as applicable to, say, "maintenance of equipment": give me the distinction between the direct and the indirect expense.

A. In the application of what have been called the "general and supervisory expenses" right through here we followed exactly the same plan in the division on the basis of whatever had been applied above it as direct, or as near direct as we could make the application. There is no difference between the application of the general and supervisory expense in each case. It all applies on a basis of

2526 the expense apportioned above it.

Q. You say station expenses cannot be applied to transportation expenses because they are not train expenses: of course we all understand that, but they are an expense, are they not? They cost you an expense that is essential to the transportation of freight because that involves a handling of freight that is carried on the cars.

A. That is true.

Q. You could not transport freight without providing for handling it?

A. That is true, but you handle it before you transport it and after you transport it, so we set up the handling separate.

Q. Is not damage to the track, "by the elements" as it is called, or the cost of repairing telegraph poles or some structure that may be on the track and which is not actually used by the trains in passing, an indirect expense just about in the same sense in reference to the "maintenance of way and structure" charge, that "station expense" is in relation to transportation charge?

A. No, I would not consider that they were of the same nature at all.

Q. Do you not think they are analogous?

A. No, I would not say so.

Q. Mr. Wharton, will you furnish me with a statement showing the amounts charged under each of the sub-heads that
2627 follow "maintenance of equipment" in your exhibit "J"? That is, under the heading of, (*a*) "locomotives; yard; road"; and under (*b*) "freight cars"; (*c*) "supervision and general"?

Then, under the heading of "transportation expenses" the items opposite the letters from (A) to (H) inclusive? That is to say, each of the sub-divisions of transportation expense on the St. Louis Southwestern Railway and also on the St. Louis, Iron Mountain & Southern Railway?

A. You mean just the several accounts that go under each of the——

Q. Yes, both freight and passenger. Exhibit "I" and exhibit "M"; both.

A. Do you want those as formal statements or just for your own information?

Q. As formal statements.

2628 Q. Mr. Wharton, did you get those statements for me?

A. It will take me some little time to prepare those. I will have them for you in the morning.

Q. What is your personal view as to the percent of freight car expense that would be attributed to terminal handling for the purpose of making repairs growing out of switching?

A. Is this on the maintenance of freight cars?

Q. Yes.

A. I cannot say that I have any personal view on this subject.

Q. What is your view as to the total expense of repairs of freight cars, attributed to repairs from stopping and starting at way stations?

A. I have no personal views on that subject. All I studied up has been what I looked up in Mr. Wellington's book.

Q. On terminal handling you have no personal view?

A. No, sir.

Q. Mr. Wharton, the result of this formula, or exhibit K, insofar as "maintenance of way and structures" are concerned, is "that the total charge to freight service is divided between local and through trains on the basis of the total engine and car miles in each
2629 class of trains, allowing fifty percent additional mileage to the local trains for station switching and adding 150 percent to all engine miles to get the equivalent in car miles, charging the trans-state freight, which is 51 percent of the total traffic, with an equal proportion of the total expense of each class of trains based on the amount of tonnage in the trains; and disregarding the fact that maintenance of station buildings and side tracks other than passing tracks are not chargeable to the trans-state freight;" is not that the result of your formula of division?

A. Practically, I think; as near as I can understand the question.

Q. Is it not true that the total charge for repairs to locomotives and freight cars is made practically upon the mileage of the equipment, with added percentage to cover switching service and terminal

handling, some of these percentages being based upon conditions in 1887? I am referring to Mr. Wellington's statement as to the percents. This includes both?

A. Yes, sir.

Q. But making no allowance for lighter loading of state freight, for the greater use of cars in state traffic, nor for the greater empty movement required in short haul state business: is that correct?

A. No, it is not.

2630 Q. In what respect is that incorrect?

A. The charge of the local business is for all the cars moved in trains, whether empty or loaded; whether half loaded, quarter loaded, or of company material. The expense is all there and it is taken care of. The same applies to the through train. Those elements are taken into consideration in that regard.

Q. Do you mean to say that the statement that no allowance is made for the lighter loading of state freight is not correct?

A. I do not think that is a correct statement, no. The entire cost of the local train is there, whatever the loaded train may be loaded with, state or interstate freight; or maybe it is loaded lighter or heavier. The entire cost is there. That is the reason I cannot see the point of your——

Q. Do you make any allowance for the larger movement of empty cars in local service?

A. The cost of the hauling of those empty cars is all there. It is part of the maintenance and is all there.

Q. In this division you make, you make no allowance? You charge the expense of hauling empty cars the same as if they were loaded cars and divide the expense on that basis?

A. The total expense of the train; not on the basis of empty cars, but of the freight it carries, whether loaded or empty.

2631 Q. You do not distinguish between a car that is empty and a car that carries 40,000 pounds?

A. Not as to maintenance expense, no, sir.

Q. Either as to the maintenance of the car or as to the effect that the weight of the car may have upon maintenance of way?

A. As to both maintenance expenses; maintenance of way and structures and maintenance of equipment I mean.

Q. Is that statement correct, except as you indicated a moment ago?

A. Your statement that you made originally?

Q. Yes.

A. I would not care to say so. I would rather hear it again.

(Question read.)

Q. After hearing it re-read what do you say?

A. The whole statement is based on the fact that I objected to in my answer, so I would not say that your statement was correct at all.

Q. You referred in your answer to the cars carrying company material: I thought your statistics upon which you based your formulas were based exclusively on revenue freight.

A. Yes, they are——

Q. Do you include Company material?

A. What I meant was cars loaded with company material.

2632 The maintenance of those was——

Q. All other items than those that have been enumerated, of equipment, are divided on the basis of the percentages ascertained in the division of locomotives and car expenses, are they not?

A. Are you referring to "supervision and general"?

Q. I am referring to all items under the head of "maintenance of equipment."

A. There are three items under that head: "maintenance of locomotives"; "maintenance of freight cars" and the other is "supervision and general."

That "supervision and general" is based on the charges that are arrived at under the head of locomotive and freight car maintenance.

Q. That is on the same basis as the other?

A. Practically.

Q. It is correct?

A. They are all on a locomotive and car mile basis, with proper allowances.

Q. You divided "traffic expenses" on a basis adopted by the Railroad Company?

A. On a gross revenue basis: what they call a "straight revenue basis."

Q. In your formula "station expenses" are divided on the assumption that every ton of state freight has the use of two agents

2633 and two station forces; that every ton of interstate freight has the use of one agent and station force, and every ton of trans-state freight has the use of an agent and a station in Arkansas, even though it is billed and loaded at Kansas City, Mo. and delivered and collected for at Alexandria, La.?

A. They are divided in a comparative sense on a basis of all state business having two terminals within the State, as compared with one terminal for all interstate business, including trans-state.

Q. But the result in its practical application is what I stated in that question, is it not?

A. No, I would not care to take that unqualifiedly.

Q. In what respect is it not?

A. As I stated in my testimony before, I think, lots of the interstate business has two, three and four terminals handlings in a state; lots of state business has three and four handlings and I doubt not that a good deal of trans-state business is handled at times in the state. So that the figures we have used here are a good deal in the comparative sense as to the relative handling of the two classes of traffic.

Q. I am not speaking of terminal, I am speaking of "station expense."

A. I am speaking of "station expenses." I should not have said terminal.

Q. What do you mean when you say that some interstate
2634 freight has three and four handlings in connection with station expense? I understand what you mean in connection with terminal expense, but not "station expense."

A. Cotton, for instance, must have more or less, two or three handlings in the state. I think the testimony indicates that. I believe it indicates that grain does.

Q. In what sense are you using the word "handling"?

A. The station handling and the work that has to be done around a station to take care of the freight—the billing, checking, etc. I am not familiar with the details and am testifying a good deal from hearsay in that particular, and what I have read.

Q. If you leave cotton out——

A. I should say that a good deal of freight comes in from junction points; is unloaded and loaded again; goes on to its final destination, and would have two handlings. Interstate freight I was thinking of then. For instance, freight in or out of Memphis; or freight in and out of Fort Smith. Those are items that I had in mind when I spoke of interstate having more than one, and state more than two handlings.

Q. Have you excluded the theory that some parts of intrastate freight may have more than two handlings? Is not your formula based on that basis?

A. It is on the assumption strictly that the state business is handled twice to each handling of intrastate, including transstate.

2635 Q. With the application of these station services, such as the use of an agent, loading, unloading and so forth to transstate freight, although it may not be handled in Arkansas?

A. It is included in the interstate and has its share of expense.

Q. "Yard expense" is divided in your formula on the basis of the number of cars handled at terminals without regard to the class of traffic or length of haul, or any other factor, except the number of cars, is it not?

A. That is the only factor, the number of cars handled at terminals.

Q. "Fuel and locomotive expense" on the Iron Mountain has been divided on the basis of the cost on another railroad, at a period of one year later than the period under investigation.

A. The comparative engine mile cost on the other road; the cost per engine mile for the use of fuel.

Q. Wrecks; personal injuries and damage to property, not on the train, is divided on the mileage of trains; and other items of a miscellaneous nature are divided in proportion to the expense ascertained in various ways and by various percentages in other accounts?

A. Yes, sir.

Q. And it is true that the only item divided upon an *an*
2636 actual basis and without the element of speculation or assumption, was "loss and damage to freight in transit," is it not?

A. That was actually worked out for one month.

Q. I asked you if the only item divided on the actual basis, without the element of speculation, is not "loss and damage to freight."

A. It was worked out actually for one month, as was also the road engine and train men pay-roll. All the other items are divided as indicated on the various bases stated.

Q. Mr. Wharton, in your reference to road engine men and train men, which you say are on the division of expenses, was that an actual division of actual expenses for the month of October, 1907?

A. It was intended as such. The instructions were to get the actual expenses for that month, for that purpose.

Q. For both local and through?

A. That is my recollection of the instructions. I am not really positive as to that——

Q. Do you know how each one was associated?

A. I do not know. Mr. Hamilton is entirely familiar with the details as to that. It is possible on that, Mr. Moore, we have worked up only the local train.

Q. You cannot state, then?

A. No, I cannot be positive about that. I would have to consult Mr. Hamilton about that and find out.

2637 Q. Referring to your division of "loss and damage to freight" and "engine men" which you think was worked out on actual cost: you applied that though to the six months' business for the last half of 1907, on an assumption that the same ratio would apply to the six months as would apply to the month of October?

A. Yes, sir.

Q. Mr. Wharton, after you had worked out all these various formulas, you divided the total expense of operation for the six months, excepting traffic expense, station expense, loss and damage to freight, and a small part of supervision and general expenses, between state and interstate traffic on the ton mile basis, did you not?

A. Yes, sir.

Q. And the amount divided on the ton mile basis was 83.3 per cent of the total operating expenses for the six months, was it not?

A. That would be about the right percentage, yes, sir.

Q. Is that what you call "whipping the Devil around the stump"?

A. No, sir.

Q. Is the result of the division of expense between state and interstate traffic, on the formulas filed by you, not the same that would result from the application of the straight revenue basis, without any allowance for extra expense in conducting state traffic?

2638 A. It is almost the same as the straight revenue basis, but not quite.

Q. It is practically the same?

A. On a straight revenue basis the percentage of intrastate business to the total is 13.41 percent and the expense 12.81 percent.

Q. What result do you get by multiplying the total expense by 13.41 percent; what are the figures?

A. You mean taking the total expense?

Q. $3,073,843.40 multiplied by 13.41 percent.

A. $412,000.00 in round figures, as the operating expense; about $18,000.00 more than the figures worked out on this (indicating

exhibit). This just includes the straight operating expenses on the Iron Mountain road.

Q. Now, does the result work out practically the same way on the Cotton Belt Line?

A. On the Cotton Belt 9.78 percent of the freight revenue is state and 10.83 percent of the freight operating expenses are state; somewhat above on the straight revenue basis.

Q. What is the difference in figures between the result of the application of your formulas of division between state and interstate on that basis and a straight revenue basis; the figures presented by Mr. Kimbell?

A. On a straight revenue basis the state business would cost
2639 $90,500 as compared with $100,000 that we show—just in round figures.

Q. Now, going to the formula prepared by you and submitted here in connection with passenger traffic, I want to ask you if you made division there as between local and through service?

A. No, sir.

Q. Why did you not?

A. We had no basis for the division of the expenses ascertained in that way. We did not have the passenger miles by local and through trains.

Q. On Exhibit "M" I find this statement: "As nearly all passenger trains on the St. Louis, Iron Mountain & Southern Railway Co. do a local business, we have not considered it necessary to make any division of expenses as between local and through service."

That is what you say on that exhibit: is that your reason?

A. That was one of the reasons and the other was also a reason.

Q. Would not that reason apply just as well to a different division of local and through freight expenses?

A. No, sir.

Q. Is not freight business divided between each class of service?

A. Yes, local and through, and the passenger business is divided
2640 between local and through—Mr. McPherson in his classification——

Q. Is not the freight business——

A. —of passenger trains assigned only a very few trains as through trains, all the rest as local trains—most of the trains——

Q. You acted then upon the basis of Mr. McPherson's testimony in that respect, did you?

A. Yes, as to local and through trains in the passenger business.

Q. Assuming that that was a correct statement?

A. As to the local and through trains.

Q. You divide the expense between coach, Pullman, mail and express service, on a car mile basis?

A. Pretty generally.

Q. Under the head of "Maintenance of way and structures"?

A. Yes, sir.

Q. How did you get at the mileage of coaches, Pullman cars, mail cars and express cars, respectively?

A. That was worked up under Mr. Hamilton's direction and I would have to ask you to get that information in detail from him.

Q. You do not know how it was worked up?

A. Not in detail, no, sir.

Q. You would not be able to explain, then, these divisions that were made?

A. I can explain the divisions of expenses, but not the method of getting at the coach and Pullman car mileage in detail.

2641 Q. You have divided all the expenses of "Maintenance and equipment" in the passenger service, except "Supervision and General Expenses" on a car mile basis, I believe: have you not?

A. Yes, excluding in the case of passenger train cars the maintenance of Pullman cars.

Q. Under the head of "Station expenses" you have made an allowance of ten cents a day for the handling of mail at certain stations: what stations were those?

A. Stations where there are agents, in that case.

Q. How did you arrive at that ten cents a day?

A. In the testimony of Mr. O. L. Teachout, given before the Commission which investigated the postal service in 1900, Mr. Teachout based his station handling of mail on that rate and we simply followed the basis.

Mr. Teachout at that time was the general agent of the mail department of the Missouri Pacific, Iron Mountain, Cotton Belt, International & Great Northern and Kansas City Northwestern Railways.

Q. Will you indicate the volume and the page from which you obtained that authority?

A. Part 1, page 302. In the little expression used he said:

"I am charging for the handling of mail between stations ten cents a day."

That is the only place we found that and we simply followed that in this case, as a small part of station expenses undoubt-

2642 edly does attach to the handling of mail.

Q. What do you include in "Supervision and General Expenses" under sub-division (*c*) of Maintenance of Equipment?

A. I include the repairs, renewals and depreciation of work equipment superintendence; personal injuries; repairs of tools and machinery; shops; heating and lighting; watchmen; stationery and printing; incidentals, and a credit for repairs of equipment used in joint yards, etc.

Q. That is in connection with repair shops, is it?

A. It is in connection with the "Maintenance of Equipment."

Q. I want to know if those different items you mention are the expenses that arise in the operation of the shops, the repair shops?

A. I don't suppose all of them are, but a good many of them are.

Q. You speak of personal injuries in connection with repair shops: just look and see.

A. (After referring to exhibit:) This amount of personal injury——

Q. I am referring now to "Supervision and General" under the head of "Maintenance of equipment."

A. I thought you asked me specifically about personal injuries. You mean the whole "Supervision and General Expense"?

Q. I am referring to the sub-head of "Supervision and
2643 General Expense" under the head of "Maintenance of Equipment."

A. They all relate to the "Maintenance of Equipment" the shop expenses and other items connected with "Maintenance of Equipment."

Q. You enumerated what entered into that particular sub-head a while ago, and you mentioned repairs and personal injuries: Is that personal injuries in connection with shops that are maintained for the purpose of keeping up and making repairs to equiment? That is the point I want to know. It is all a branch of expense, connected with the keeping up of equipment of the company?

A. Yes, it is all connected with that "Maintenance of Equipment"; not necessarily in the shops, but in connection with the "Maintenance of Equipment" wherever it may be.

Q. What part of the expense have you charged to the Pullman cars?

A. Just the proportion of the locomotives——

Q. It is 13.88%, is it not?

A. 13.88% to Pullman cars.

Q. Are Pullman cars at all handled in the shops of the railway companies?

A. The engines are.

Q. Are the Pullmans, the cars themselves?

A. I think they are to some extent. I am not familiar with that, but I have an impression that whenever repairs are required.

Q. You think it proper to charge a part of the repairs to
2644 Pullman cars?

A. Yes, I think so.

Q. Suppose you are mistaken about that?

A. I don't think I am.

Q. If you are mistaken, then, it would not be proper to charge any of the expense of repairs to the Pullman.

A. Of the engines, it would be.

Q. I am speaking of repairs to the cars.

A. We are speaking of it here where we spoke of "Supervision and General"; all repairs, whether locomotives or cars.

Q. I understand, but a portion of that is repairs to the cars themselves?

A. Yes, sir.

Q. If Pullman cars are not handled and repaired by the railroads would it be proper to charge any portion of that expense to the——

A. Yes, it would be. The "Supervision and General" naturally takes in everything that is repaired there. The locomotives are repaired there and the locomotives pull the cars, and their expense passes back over the trains.

Q. Assuming now, to meet your view, that 1% of the expense incurred under this head was for repairing locomotives: Now, lay that

aside: say you attribute that to Pullman cars: should any part of what remained be charged to it?

A. We don't charge any part of other maintenance. Just the portion that is charged under the head of locomotives.

2645 Q. Under the head of the division of cost of coach and Pullman service, between intrastate and interstate, you have divided the cost of Pullman service between intrastate and interstate business on the basis of 25% intrastate and 75% interstate: where did you get those percentages?

A. Those were just arbitrary percentages based on just general knowledge about the use of Pullmans, but no detail figures back of them.

Q. What do you include under the head of "Traffic Expenses" in the division between passenger expenses?

A. It includes superintendence; foreign agencies; advertising, stationery and printing.

Q. It is the same thing you stated in connection with the freight traffic?

A. Practically, the same, yes, sir.

Q. What has that to do with the mail and express business of railroads?

A. On the revenue basis, I think it has just as much to do with that as the passenger traffic.

Q. On the theory that you are going on?

A. I have no theory on it.

Q. You have charged 11.63% of that to "mail" and 7.70% of it to "Express:" is there any part of it applicable to those branches of service?

A. The only theory on which it can be divided on a revenue basis is that each part of the revenue should stand its share

2646 of the expenses. That being the case, it applies against "Mail" and "Express."

Q. In other words, you agree with the revenue theory when it comes to——

A. No, I am not giving this as my basis. I am simply following out the revenue theory of making divisions.

Q. So, you followed the revenue theory there, Mr. Wharton?

A. We took that as we did because we had no other on which to divide it.

Q. You frightened me very badly at the outset, because I thought you were going to divide it on a basis of facts. I was afraid you were going to present here endless facts, but this is a deviation from that basis.

A. We qualified in each case by stating that the traffic expenses we have no basis of dividing.

Q. You make the traffic expenses an exception?

A. Yes, sir.

Q. Mr. Wharton, if you were really trying to get the actual expenses chargeable to traffic, would you apply any of it to mail? If you were trying to get at the actual facts?

A. I would have to go into the offices and see how they handle

the "Mail" and "Express" in their traffic department. I would not be able to give you an answer without such an examination?

Q. We have a contract here. Have you seen that con-
2647 tract? You say that you have read the evidence. We have a contract between the railroad company and the government.

A. I presume there must be some traffic expense in there chargeable to "Mail" and "Express."

Q. We have a contract under which the mail is carried and we have the contract between the Express Company and the Railroad Company: I suppose you know what they are?

A. I know in general what they provide.

Q. If you were making an actual division on a basis of actual expenses incurred, would you charge 19% to mail and express?

A. I could not answer that without going into the matter very thoroughly, and knowing the traffic expenses incurred in mail and express business handled.

Q. You have made this division without going into the matter?

A. I have, without going into that matter at all.

Q. There is a good deal of theory about that?

A. It is all theory, as far as traffic expenses are concerned.

Mr. HILL:

Q. Is it your theory or the railroad company's theory?

A. The railroad's theory.

Mr. MOORE:

Q. You take what is good and leave out what is bad?

A. I would not say we took what was good. We took what we had to.

2648 In that connection, I might add to that, Mr. Moore, (I just thought of it now): Referring to this testimony before the Postal Commission, the railway companies always included on a car mile basis a portion of traffic expenses in figuring the cost of mail service.

I believe there is a statement in one of these by Mr. Johnson, the Auditor of the Cotton Belt, on that very point.

And I might say further, also, it occurs to me now that in a case tried before the Interstate Commerce Commission (Case No. 1028, entitled Kindel vs. Adams Express Company) Mr. Peabody, of the Santa Fe, filed a statement showing the cost of express business and also included traffic expenses on a car mile basis, as a portion of the cost of doing express business.

Q. What do you think about the correctness of that?

A. I presume it is just as good as any other way. I would not pass on it. Those are the views of the railroad men themselves as to the proper division of these expenses along with other expenses.

Q. You have the car mile division and the revenue division: which do you think is the better basis of division?

A. Well, as to traffic expense I would not care to say because I

don't know. There is not a great deal of difference, I don't believe, between the two bases.

Q. Mr. Wharton, I observe on the last item which appears on Exhibit O, which is a summary of revenues, etc., you use
2649 the term "Percentage of net earnings to valuation" describing the per cents which are on the line opposite those words:

Do you make any distinction between that and the term used by the railroad company "Return upon the assessed value of the property"?

A. I presume they are the same. This is just the assessed value of the property doubled. I presume that is on the same basis.

Q. I want to ask you if by using the term "Percentage of net earnings to valuation" do you mean to imply any different meaning or significance to your figures than that which would be implied in the formula prepared by the railroad company?

A. No, sir, there is no difference.

2650 HERBERT C. WHITEHEAD, a witness of lawful age, being duly produced, sworn and examined on behalf of the defendant, testified as follows:

Direct examination.

By Mr. HILL:

Q. Will you please state your name, residence and occupation?

A. Herbert C. Whitehead; Public Accountant and Auditor; Chicago.

Q. What experience have you had in railroad work, Mr. Whitehead? Kindly give us a little outline of your experience.

A. I was thirty-five years in the railway service, commencing about the end of 1872 as office boy and junior clerk in the general freight office of the old Kansas Pacific Railway, now part of the Union Pacific Railroad.

I was promoted in due course to corresponding clerk—that was before the days of stenographers and typewriters—and from that I became local cashier and paymaster connected with the auditor's office.

From that I became traveling auditor on that same road and was for one and one-half years traveling auditor and tax agent.

Then for a short time I was accountant and paymaster of the Mackinaw extension of the Michigan Central Railway; that was for less than six months.

2651 From there I went to the Atchison, Topeka & Santa Fe as traveling auditor, for about one and one-half years and was appointed auditor for the southern Kansas portion of the Santa Fe, at Lawrence, Kansas, and stayed there for six years.

From there I went to Los Angeles, California, as auditor of the Southern California Railway and was there for eight years.

Then I was promoted to be general auditor of the Santa Fe system, with offices in Chicago, and filled that position for nine years.

Q. What years were they?

A. 1896 to 1905. For two years after that I was consulting auditor of the system.

Q. The Santa Fe?

A. Yes, at Chicago.

Q. That carried you down to 1907?

A. To the end of 1907.

Q. What have you been engaged in doing during the last two years?

A. Public accountant and auditor.

Q. With offices in Chicago?

A. Yes, sir.

Q. Since you retired from active railroad work, have you kept in touch with railroad affairs and with economic questions that have been presented in railroad accounting?

2652 A. So far as I could under the press of pretty hard work which at times would last months, but I tried to keep myself as well informed and as alert in that respect as it was possible for me to do.

Q. Have you been connected with the American Association of Railway Accounting Officers?

A. Oh, from the beginning. I was from the time it was organized, in the '80's.

Q. Have you kept in touch with its work?

A. Up to the time that I retired from the Atchison as the consulting auditor, yes; and to some extent since.

Q. Have you served that Association in any official capacity?

A. I was President for one year, while I was general auditor of the Sante Fe.

Q. What is the scope of the work of that Association, Mr. Whitehead?

A. It is an association to enable its members, who are accounting officers—and in some cases their immediate subordinates are also admitted—with the view of bringing about uniformity in methods and improvements in methods.

It is really an effort on their part to keep in touch with the development of accountancy, I should say, as done in their business and in outside businesses.

Q. I wish you would define what you mean by "accountancy."

2653 A. Some years ago the question was up with the dean of one of the schools of commerce, accounts and administration, at one of the universities in the west, and he was getting a great many definitions at the time from various people, railway people and accountants.

I happened to be down there at the time visiting my boy who was attending that university, and he asked me for a definition. I couldn't give it to him offhand, so I promised it to him. I made it in the rough, going up on the train that evening and furnished it afterwards. If you care to have it I can give it to you right now. It may require a little slight explanation and amplification.

"Accountancy is the accurate, truthful and scientific expression, in current and generally understood form of terminology, for the purposes of information, regulation and protection against loss; and the critical review and verification of such expression".

Q. Is that accountancy, as you have defined it, what you referred to in speaking of "railroad accounting"?

A. Yes, sir, but the railroad accounting is just one branch of accounting. The same principles which underlie all accountancy would underlie railway accounting. The practice might differ quite a good deal from the practice of merchandise concerns, manufacturing and others, due to what you might call the abstract character of the railway business. They don't have anything tangible.
2654 You can't buy anything and sell it again. There is that abstract feature that attaches to railway business, or any public service, that makes it quite different from a commercial concern.

Q. Different in detail, rather than in practice, is it not?

A. Different in arrangement and detail, both.

Q. Have you in your work given thought and investigation to questions of dividing railroad expenses between various accounts and departments of railroad work, between state and interstate transactions?

A. Through the whole course of my career as an accounting officer, I had a great deal to do with the preparation of statistics of division of earnings and expenses between main and branch lines, as you might say, of the properties, but not between state and interstate. The thing was not required in my day at all. I don't remember ever to have had a demand or request of that sort when I was in the accounting offices of railways.

Q. That seems to have come up as a litigious question, rather than a practical one?

A. What sort?

Q. Litigious, a question of litigation?

A. Oh, yes. I should say that the division of revenue and expenses between state and interstate, was a matter that was political and external, as compared with the division of earnings and
2655 expenses between the main and branch lines of a system. The latter would be economic and internal, whereas the former would be political and external.

Q. How would you classify a division between freight and passenger?

A. That is internal; economic and internal.

Q. In this case the plaintiff railroad companies have sought a separation of state and interstate business, and have separated the revenue derived from those two classes of traffic, and then seek to separate the expense of the two classes of traffic, and apportion the revenue that one class bears to the other:

I will ask you your opinion of that method of ascertaining the relative cost of state and interstate business.

A. In my judgment, to determine cost on the basis of gross earnings is not a very sound determination. That basis is not sound,

whether you attempt to divide the expenses as a whole or a portion of them on that basis.

My principal reasons for my view are, that in the case of a trader in merchandise, he would—if he followed that line of argument or reasoning—determine his cost on the basis of his sales of his product; and it further implies the assumption that the end and aim of the railroad enterprise is gross earnings and not net earnings, as I look at it.

Q. Suppose the facts are as developed here: that the gross
2656 earnings that are used to determine the expenses are derived from two separate and distinct systems of making the rates which produce those revenues—one a Commission tariff, arranged by state authority, based on distances the freight is carried, and the passenger based on the distance the passenger is carried; and the other the Interstate rates, based on many conditions, commercial, competitive and otherwise:

What further effect would such system as that have upon the revenue as factors in determining the cost of doing the business?

A. Why, it seems to me that that would be a matter of very minute inquiry, before anybody could give an opinion. Any competent accounting officer before he gave an opinion as to what the effect would be—it would be a matter for minute inquiry as to what the effect would be.

Do you really mean to ask what the effect would be or whether the method would be changed?

Q. Really my question goes to both propositions: what effect would it have upon this method of dividing this dual system of making rates as based upon different considerations?

A. Speaking from the point of view of having in mind the principles and practice of accountancy, I should not say that it would make
2657 any change whatever in the method that would be chosen to arrive at the cost; if there were sound bases for arriving at those costs, that the fact that a certain tariff was in effect or another tariff was in effect, different from it, would not make any difference at all in the method of division, or the method of the determination of the cost.

Q. It would not be the tariff: it would go back to the measure, whether that was a proper measure of costs?

A. No, sir; I should say not. That is determined by other things than what particular tariff might be in effect, either freight or passenger.

Q. And either state or interstate?

A. Either state or interstate.

Q. Mr. Whitehead, have you examined the exhibits that have been filed in this case by the State, that have been put in evidence by Mr. Wharton?

A. Yes, sir, I examined them and went over them with him.

Q. Take for instance the exhibits that deal with freight traffic.

A. Which road?

Q. You might take the Iron Mountain. The principles are the same.

You will see from those exhibits, as you doubtless know, that there is an attempt made there to ascertain the cost of state and interstate business, by ascertaining the cost of local and through trains,
2658 and then ascertaining the volume of state and interstate traffic that is carried upon those trains, and in that way ascertaining the cost of the state and the interstate:

I will ask you to give your opinion of that method of apportioning those expenses.

A. You are asking me for an opinion in detail or in a general way?

Q. In a general way.

A. Why, it seems to me to be very fairly worked out and quite approximately correct.

Q. Are the bases that are used there for the various divisions, such bases as are used by railroads in their own apportioning, and are well known and recognized factors for determining these divisions?

A. To my certain knowledge, they are the ones that have been worked out experimentally by the railroads, in the last forty or fifty years, which they have come to as the business increased and as the density of traffic became greater.

Cross-examination.

By Mr. MOORE:

Q. I believe you said, Mr. Whitehead, that you have never undertaken or had any experience in dividing between state and interstate business, as between the main line and branch lines: that your work has been done in the matter of dividing revenue expenses: have I understood you correctly?

A. That was quite correct, yes, sir. Your understanding
2659 was correct.

Q. Have you had occasion to make a division of revenue and expenses between local and through trains?

A. At times, as auditor I would be called upon to make statements of train earnings and expenses for the Manager of the road of which I was auditor. I can't recall those things just now. They are constantly coming up; they are asking for statements of station business; for the earnings and expenses of particular trains. In all railroads I think the auditor is called upon for that sort of work, to a greater or less extent, according to the volume and character of the business.

Q. Let me see if I understand: what would be the extent of a case like that, if you have any case in mind? What would be the nature of the inquiry you would make?

A. The inquiry would come from the general manager or general superintendent, to the auditor. He would be asked to prepare statements showing the earnings and expenses of certain trains, or give the business of certain stations and what their expenses were.

Q. What would be the purpose of that, Mr. Whitehead?

A. To inform the operating official so that he might learn whether those trains were paying or not, and predicate his judgment as to

continuing them; increasing the service or changing it in some respect; purely a matter of internal workings.

2660 W. E. FITZ GERALD, of lawful age, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. I wish you would please state your name, age, residence and occupation?

A. W. E. Fitz Gerald; 39; Residence, Austin, Texas; Auditor and expert Accountant, Railroad Commission of the State of Texas.

Q. How long have you occupied your present position?

A. Since June 1st, 1909.

Q. Prior to this work that you are now engaged upon, in what were you engaged?

A. I was in the railroad service, with the H. & T. C. R. R.

Q. How long have you been engaged in railroad service?

A. 24 years.

Q. I wish you would give a brief history of your railroad service, mentioning the earliest, and follow it through to your present position?

A. In June, 1885, I entered the railroad service in the accounting department of the G. H. & S. A. R. R., at Houston, Texas, as an office boy, and my service has been in that department continually ever since, occupying positions, as voucher clerk, general bookkeeper, and chief clerk, in charge of general and disbursement accounts.

Q. With what railroads have you been connected?

2661 A. With the Southern Pacific interests, from June, 1885 to I think about 1890, and from 1890 to 1894, with the San Antonio & Aransas Pass Railroad at San Antonio, and from that date, I was with the H. & T. C. Railroad, and I then afterwards worked again with the Southern Pacific interests, and returned again to the H. & T. C. Co., my last service being with that Company.

Q. I believe you stated all your service has been with the Accounting Department, of these railroads in different capacities?

A. Yes, sir.

Q. Has your work in the railroad service, and with the Texas Railroad Commission made you familiar with railroad accounts, and have you made a study of that subject?

A. Yes, sir.

Q. What is the scope of your work with the Railroad Commission?

A. The principal work is in the nature of compiling statistics, and examining the records, verifying any data that the different railroads might be called upon to furnish for our use.

Q. Are you dealing with railroad accounts in this position?

A. Entirely.

Q. Have you made any study and investigation of the question

of dividing expense accounts in various departments of the railroad, work, between state and interstate traffic?

A. As between state and interstate traffic, not to any great extent. The question has never come up very much; in fact, I never knew it to come up before while I was connected with the railroad service, The only division being required as to traffic being between freight and passenger service.

2662 Q. Have you, since you have been with the Commission, had occasion to examine the questions of state and interstate relations and the separation of their work?

A. Not to any great extent.

Q. Are you familiar with the various bases of divisions of railroad expenses, ton mile, car mile, train mile, etc.?

A. Yes, sir.

Q. In this case, the plaintiff railroad companies have sought separation of their state and interstate business, and have obtained the revenue from each of those classes of business separate, and have the gross expenses of the State of Arkansas ascertained for a given period, and are seeking to divide those expenses between state and interstate traffic, in proportion that the revenue state and interstate, bears, what is known as the revenue theory of dividing expenses. Are you familiar with that theory of division of expenses?

A. I have given it some consideration.

Q. I wish you would state your opinion of that method of ascertaining the expenses of state and interstate traffic?

A. I would say the revenue theory appears to me to be exceedingly erroneous, in view of the fact that the operating expenses of a railroad bear little relation to its income or revenue derived from traffic. For these reasons, 1st, the preponderance of expenditures being apportioned as a whole, *giving* on a basis irrespective of revenue coming in, making the expenses largely independent of the amount of traffic, the constant expenses being considered as an average, we will say, about 60%. Second, it is a well known fact that the actual

2663 cost of service is more often disregarded in arriving at rates, the same being based frequently on other conditions, such as competition or commercial conditions, industrial developments, etc., without any consideration to the distance of the haul. In my opinion, the revenue theory would not be a fair basis under these conditions.

Q. In addition to the reasons that you have given, I will ask you what relation if any, exists between the rates or revenue, state and interstate, that would make the revenue derived from each of those sources a proper measure of the cost of the service?

A. I don't see where the revenue would make it a proper basis for the very reasons enumerated, that these considerations are not given in making the rates.

Q. Have you examined the exhibits in this case, that have been filed by the state with Mr. Wharton's deposition?

A. Yes, sir.

Q. I wish you would express your opinion as to those exhibits,

as to whether or not they show a proper division of the expenses between state and interstate business?

A. The basis prescribed, as a whole, seems to be, in my opinion, those which will bring about an exceedingly close approximation of the actual conditions. The use of a train, engine, car and ton mileage, as adopted for the respective accounts, appear applicable in a great many instances. The use of one in favor of the other is a matter of opinion, even though the results obtained might be, and are, very often practically the same. The obtaining of
2664 actual costs of local and through train and engine service, and then applying the ton mileage, is in itself, bound to bring about very nearly the exact conditions as to the expenses applicable to each class of traffic. The arbitraries assumed appear on their face, to be very conservative. An experience- operating official could, however, more definitely analize and explain the occasion for some of them than I could, owing to the limited investigation or consideration that has been afforded in the examination of this exhibit.

Q. By those arbitraries, you are referring to this 50% engine mileage, and these other matters that have been referred to?

A. Yes, sir.

Q. Now, take up some of this detail. Have you got a copy of this exhibit before you?

A. Yes, sir.

Q. Turn to "K" please, maintenance of way and structures, the proportion of these expenses applicable to freight business as shown by statements in this case, submitted by the Companies, has been divided between local and through train service on the basis of the total engine and car miles of each class during the month of October, 1907, that month being considered representative of the business for the six months ending December 31, 1907. In arriving at the number of engine and car miles we have added 50% to the engine mileage of local trains for station switching, and I assume that each engine mile was equivalent to 2½ car miles. You see the basis of that is the car mile of each class, with these additional allowances
2665 for engine miles of local trains, and for weight of locomotives. I will ask you your opinion of that method of dividing the maintenance of way and structures?

A. I would say that the total engine car mileage, is, in my opinion, practically the closest approximation that can be arrived at. It is practically equivalent to the gross ton miles which is frequently used.

Q. Is this the accepted basis for dividing expenses of car mileage?

A. Yes, sir, it has been in my experience; the engine mileage is especially applicable to maintenance of way expenses.

Q. Attention has been called to the fact that the proportion—probably a large proportion of the maintenance of way and structures expense is due to other causes than the running of trains, wind and water and things of that kind. I would ask you what effect, if any, that should have upon the division of this kind of car mileage basis?

A. I should say that the accounts or other parts of the service that are affected by other elements would, in nearly every instance, or in

a great many instances, be placed there, you might say, for the benefit of the train service indirect, and should therefore fall thereon.

Q. Your idea is, I gather, that it is for the use of the trains?

A. Yes, sir, in other words, in my experience, I have never had it brought out that there should be any difference between—any great difference between those two elements; that it is accpted as a general proposition that the entire maintenance of way expense
2666 should be practically considered the same. In practice of railroads I have been with, they follow that theory.

Q. You would think then, there should be no difference made between expense that is caused by the wear of the train, and that caused by the operation of the locomotives?

A. Not a great deal, no.

Q. We have to take the use to which that track is put, in order to find out the expense that will appertain to each class of service on it.

A. Yes, sir.

Q. Take this next account of maintenance of equipment, what do you think of the locomotive mileage and car mileage basis used in the ascertainment of the expense under that head, between local and through trains?

A. I would say the engine mileage and the car mileage is the basis that is generally used by all railroad companies, in arriving at their cost of performance of locomotives, and train and car service, and it seems that those bases are really what bring about, in the greatest measure, the necessity for repairs to the locomotives and cars.

Q. I call your attention to the division of expense under that head, freight cars; the accountants have recognized the additional item charged to the repair of freight cars, that has been reached by Mr. Wellington in his work on "Railway Location." I will ask you if you are familiar with that work and know whether or not
2667 it is a standard work, and accepted among railroads?

A. I understand that it is generally recognized as a very good work.

Q. Have you any knowledge upon which to base an opinion of your own, aside from Mr. Wellington's work, on that subject, as to what would be the proper percentage to allow for these items that are referred to under that head?

A. No, I hardly think I would be qualified to pass an opinion as to the division that might be made on this account, it being more largely of the departments of physical operations, I should say. However, I would imagine that would be a very conservative addition to it, and would cover the results that you seek to obtain.

Q. The next item under that is supervision in general, paragraph "C". I call your attention to the method of dividing that expense into local and through service on the basis of direct charges for maintenance of equipment, and I would ask your opinion as a railroad accountant on that method of dividing supervision and general expense—"C", page 3.

A. I would say that the plan followed here seems to me to be the most equitable that could be obtained; it follows the theory of

what is termed general shop expense; general shop expenses are distributed in a way over the accounts that are affected, and this supervision in general is practically, as I would take it, on that same theory.

2668 Q. Is that considered a sound theory in accounting practice?

A. It is so considered, and has been adopted by the Interstate Commerce Commission.

Q. Is it in force in business affairs as well?

A. I have never had any experience in business affairs, but from conversation with accountants in commercial enterprises, I should judge they follow that rule to a greater extent than the railroad companies do.

Q. That same method is followed throughout these exhibits, for all supervision in general, and for general expense, and your answer in regard to this particular exhibit, head, is applicable to all that particular class of expenses?

A. Yes, sir, I think so.

Q. Don't the railroads, when they do work for another railroad add a certain percentage, say 10%, for supervision and general expense?

A. Yes, sir.

Q. That is common practice?

A. Yes, sir.

Q. And they charge it in proportion that the direct costs are apportioned?

A. Yes, sir.

Q. The next I find is traffic expenses; these are divided on the straight revenue basis; although accountants state in their opinion, that this unduly burdens the intrastate business, owing to the fact that a considerable portion of the traffic expense is incurred in an effort to secure competitive business, while it is well known

2669 that intrastate business is largely non-competitive; this was used by the railroads in their evidence and it has been used by the State. I will ask your opinion upon that as a division for dividing traffic expenses?

A. The division of these expenses as a whole, upon the revenue basis, on the ground that no other basis is as near applicable, results in unduly burdening the state traffic with expense, while known from their nature to be directly chargeable against interstate service. Therefore, it will appear, we should first locate those heavy expenses directly incurred for interstate service, and such as foreign agencies, traffic associations, industry and emigrant bureaus, etc., and then proportion the balance on the basis of local and through revenue, train mileage, as being the nearest unit reflecting the results obtained by the energy applied.

Q. Do the railroads, at the present time, keep their books in such shape that a division could be made along the lines that you have suggested?

A. Yes, the classification of operating expenses brings out largely these foreign agencies that I speak of, that in my opinion should

be considered entirely for the benefit of interstate service. I have heard of instances where they claimed a foreign agency, an outside agency we will call it, has, to some extent, pertained to state or local traffic, but I think such instances are something like Halley's comet, they are few and fair between, even more so than that
2670 comet, and I think for that reason all the railroads could very easily, for approximation, consider these outside agencies located off the line where the expenses are very great too, consider them as being applicable to interstate service, that it would be sound accounting.

Q. Your objection to this division is that it charges too much to the state traffic?

A. Too much to the state traffic, when it is a well known fact, I believe almost any accounting official would say, that the majority of the traffic expenses are for the interstate business.

Q. Almost any basis you would take, short of the separation of accounts, as you have indicated should be done, would be subject more or less to the same objection that the revenue objection would be there, wouldn't it?

A. Yes, after locating these heavy charges, the balance that would remain, would, in my opinion, be so small that almost any basis you would apply would not affect results to any great extent,—that is, the results of the total operating expenses.

Q. Turn to the next head there, transportation expenses, I call your attention to the fact that they have made an allowance there, under the heading of station expenses, a double number of intrastate tons, in order to provide for two handlings of intrastate traffic, and one handling of interstate traffic. I will ask you to express your opinion on that division? That is "A" under 4.

A. I should say that it is certainly a very conservative esti-
2671 mate, and if anything, it takes care of the extra expense that might be applicable to station service on that account.

Q. In that connection, I want to call your attention,—from the evidence in these cases, introduced on behalf of plaintiff railroad companies, that is, that cotton, which has a large movement in Arkansas, and is all interstate traffic, has three handlings, usually taken up on the way train to compress points, and there compressed, and re-loaded after compression, and shipped to interstate points, and also that grain, which has a large movement in the state, is shipped into the state principally on milling and transit rates, and shipped out of trade centers, most generally on way trains to point of destination, and is usually an interstate shipment, and would have three handlings; should those matters and others of like nature be considered in determining the amount of station handlings?

A. Yes, sir, I should think it would be necessary to consider them very largely; taking those facts in consideration, it would necessarily follow that this condition should be reversed, wouldn't it? That these extra handlings should be charged in that instance to interstate instead of intrastate traffic.

Q. On the other hand, there is evidence here that there is a large trans-state movement, which would not receive so much handling;

it is a class of interstate traffic. I believe about 51% of the
2672 Iron Mountain traffic is trans-state. Would that receive less handling than other interstate traffic?

A. It would to a certain extent, especially so far as way service is concerned.

Q. There is another piece of evidence in the case in that connection, that I call your attention to also, and that is traffic in and out of Memphis and Fort Smith is interstate traffic and has two handlings within the State, owing to the geographical locations of those two cities; I will ask you if that is a factor also to be considered in determining the amount of station handlings?

A. Yes, sir; I should think so.

Q. The next item to which I call your attention here, is hard and terminal expense. These are divided in local and through business, on the basis of the number of cars handled at terminals, as explained under the head of maintenance of yard locomotives. What is your opinion of that method of dividing yard and terminal expenses? That is paragraph "B", on page 4.

Q. The basis of handling terminal expenses,—dividing, I should say terminal expenses on the number of cars handled, appears to me to be the most applicable that can be found. In my experience of handling different terminal accounts, I found that in a good many instances, other bases had been obtained or arrived at, you might say, with different companies, more for the reason that probably one company had certain advantages; that is, they might want to
2673 sell, but generally they were all equally interested; it is a practice to divide the expense on the basis of cars handled.

Q. You refer to joint terminals when you refer to the advantage of one road over another?

A. Yes, sir, joint terminals owned by one road.

Q. One making a profit off its terminals?

A. Yes, sir. In those instances, car mileage per car handled would probably be cast aside for any arbitrary basis that they might desire to put in.

Q. But where you were going to divide two classes of traffic of the road itself, what do you think of this method?

A. I think that it is equally applicable as it would be in using that basis for division, where the roads have the same ownership in the terminal, where they seek to obtain the actual cost and that is the object. In other words, where the ownership is equal, there is an endeavor there, by using the number of cars handled, to obtain, as near as possible, the actual cost to each, and if it is used for that purpose, it certainly can be applied as between two classes of traffic.

Q. The next heading to which I call your attention, is engine house expenses "D" on page 5; these are divided between local and through service on the basis of engine miles of each class of service during the month of October, 1907, assuming however that the local engines required 12% more engine house service than other engines and this basis is based on the average engine run in
2674 the two classes of service. I will ask your judgment of the fairness of that division?

A. That seems to be about the most applicable that can be reached.

Q. Now "F," other train expenses, divided between local and through, in proportion to the train miles of each class of service; what do you say about that?

A. I would say that is about the nearest applicable unit in that respect.

Q. Turn to page 7, the method of dividing train cost, the total ton miles, of interstate and intrastate freight handled during the period,—divided between local and through service, and the train cost is divided between intrastate and interstate in proportion to the volume of traffic of each account handled in each class of service. I will ask you your opinion of that method of arriving at the proportion assignable to state and interstate business.

A. After obtaining the total cost of freight service, I should say that the ton mileage would be the nearest unit applicable. The difference in the cost of service of the different classes of freight, as a whole, would be comparatively small.

Q. You mean by classes, state and interstate?

A. Yes, sir, and the next thing to obtain would be the nearest unit, caused by any fluctuation in those expenses.

Q. I gather from your answer, that your idea is that the two classes, state and interstate, move together?

A. Yes, and the other expense is practically the same. The only exception being the yard and terminal expenses, that
2675 are a very small proportion of the whole, so that when we take the total operating expense and arrive at the cost per ton per mile of handling, why there would be a very slight difference in the cost of through service.

Q. Those differences in cost have been taken care of before they reached that point?

A. Yes, sir.

Q. I infer from your statement, that you recognize the difference in the cost of handling intrastate freight business being more expense, and I will ask you if in your opinion, all those elements of extra cost have been properly taken care of and allowed in this method of dividing expenses.

A. Yes, I think they should be more than taken care of.

Q. In other words, you think the allowance has been too much for the interstate?

A. Yes, sir.

Q. Take up the passenger business, without going into the detail of it, you are familiar with this method of division here, I believe, about the only difference is they don't carry any division between local and through trains, but it is carried more on difference in equipment; the division is made on that between engines, coaches, mail and express, Pullmans and so forth; I ask your opinion of that method of arriving at a division of expense?

A. I should judge that that is an element that certainly
2676 should have been considered, and giving it the consideration you have, it takes care of the differences that might arise in handling of that service.

Cross-examination.

By Mr. MOORE:

Q. What did I understand you to state your relations with the Texas Railroad Commission to be?

A. Auditor and expert accountant.

Q. And what is the character of work done by you in that capacity?

A. Principally the compilation of statistics from returns made by the railroad companies, and investigations or verifications of any data that they might furnished when called upon in connection with any case we might have before us for hearing.

Q. How many railroads have you in Texas, in a general way of course, I mean?

A. Our last report showed that there were 86, my recollection is, 86 railroads recognized as common carriers.

Q. Do you remember about what their total mileage is?

A. No, I don't recall it; I have the report, I can get it.

Q. There is no use of that, the number of railroads and mileage operated in your state, keeps you pretty busy in your making compilations, does it not?

A. I can give you an idea as to the mileage; there is some-
2677 thing like thirteen or fourteen thousand miles of straight main line mileage.

Q. The extent of railroad business in your state, keeps you pretty busy, doesn't it, making compilations from reports and so on, that you mentioned?

A. Yes, sir.

Q. Where do you do your work?

A. At Austin.

Q. At the office of the Commission?

A. Yes, sir, office of the Railroad Commission in the State capitol.

Q. Your work consists in working up and making compilations of the statistical information that comes in their reports of these various railroads?

A. Yes, sir.

Q. I believe you began your career, you say—you might say your industrial career—in 1885, in connection with a railroad in Texas?

A. Yes, sir.

Q. What was the capacity you worked in then?

A. At the bottom of the ladder as office boy.

Q. You began with the Southern Pacific?

A. Yes, sir.

Q. How long were you with them?

A. I might say that these roads I have enumerated here are practically all Southern Pacific interests; they all adopted the same plans and principles in accounting. I have practically been with that system all the time.

2678 Q. How long did you remain in the capacity of office boy then?

A. I think four or five months.

Q. Then what were you promoted to?

A. I took a minor position as clerk.

Q. In other words, what I want you to state is the various duties performed by you in this work, and the character of experience you obtained in this service; take them up one at a time. Your first employment was with the Southern Pacific in 1885; how long did you remain in that employment.

A. From 1885 up to 1890, that would be five years.

Q. What were your duties during that period of five years, that is what I want you to describe.

A. I was voucher clerk, and assisted the general book-keeper.

Q. How long were you voucher clerk?

A. My recollection is, probably about two years of the time.

Q. What were your duties as voucher clerk?

A. Recording of vouchers, and making distributions of them.

Q. What were your duties as assistant book-keeper?

A. Handling what is termed in railroad offices the sub-ledgers, pertaining to accounts with individuals and companies and other roads, covering their traffic settlements.

Q. That brought you down to 1890?

A. Yes, sir.

2679 Q. Then you went with the San Antonio & Aransas Pass Road?

A. Yes, sir.

Q. How long were you with that road?

A. Four years.

Q. What were your duties on that road?

A. General book-keeper the entire time that I was there.

Q. I suppose the duties of book-keeper of a railroad are somewhat similar to those of any other commercial enterprise, are they not?

A. Yes, sir.

Q. And you left that, you went to the Houston, Texas & Central Railroad, did you?

A. Yes, sir.

Q. How long were you there?

A. I was with them a few years, and then went with the Southern Pacific; I was in charge of the general and disbursement accounts,—chief clerk in the office.

Q. In charge of general and disbursement accounts, what were your duties in connection with your office?

A. My duties in that respect were of a supervisory nature, over the entire department; that is over the general books that I have enumerated previously, and the disbursement department, embracing the handling of vouchers and pay-rolls, and statistical data compiled from records showing the operating expenses and earnings.

Q. Did you have any duties to perform in the way of dividing

operating expenses as between the different branches of the service?

2680 A. Not at that time.

Q. Your duties were to keep records of what came in?

A. The actual facts.

Q. When did you go from the Houston, Texas & Central, from that employment to the Southern Pacific?

A. I think in about 1901, that I went with the Southern Pacific at Houston.

Q. How long were you with that Company?

A. About two years.

Q. What were your duties there?

A. In compiling statistics principally; that is where I had the experience of making the division of earnings and operating expenses, as between the freight and passenger service; that is where I had the actual experience of working at that.

Q. What do you mean by actual experience in dividing earnings between passenger and freight; did you say the earnings?

A. I mean the actual experience in doing the work, calculations.

Q. In other words, your experience was in clerical work?

A. Yes, sir.

Q. You had nothing to do beyond working up the figures?

A. No, sir, I will say, however, that doing that clerical work, that in schedules that were prepared for the different bases in a good many instances, the reasons given were assigned, so as to make any one thoroughly familiar with the reason why the work was performed in that way.

2681 Q. Did you acquire a general knowledge as to the methods of dividing between the freight and passenger branches of the service?

A. Did I acquire any knowledge?

Q. A general knowledge of the methods adopted by the railroads throughout the country?

A. Yes, I would say I had a general knowledge.

Q. When and how did you acquire that?

A. At this time.

Q. What is the system or the method used on the Missouri Pacific system of railroads?

A. My recollection is that they use the revenue train mileage basis; of that, I am not however, sure. In some instances, the engine miles; in some instance the car miles.

Q. What is it they divide on that basis?

A. You asked me if they divided the freight and passenger; that was your question as I understood it.

Q. What are you referring to now, revenue or expenses?

A. I understood you to say the expenses.

Q. How do they assign the revenues between those two branches of the service?

A. Between freight and passenger?

Q. The passenger?

A. The revenue very largely shows for itself.

Q. Does it altogether?

A. Not entirely.

Q. What proportion of the revenue is it that is not self-divisable?

2682 A. That would be a very small proportion, I think.

Q. What part, please, of the service?

A. I would take it, the principal part would be the miscellaneous revenue.

Q. What is miscellaneous revenue?

A. Revenues that are obtained, we will say, from rents of buildings, and earnings from the sale of privileges at stations, and things of that character.

Q. How is that divided between freight and passenger service?

A. I don't recall right now what rule is followed generally. Most roads have different usages, and a good many of them don't attempt any division in miscellaneous.

Q. It must be done in some way; it must be charged somewhere, to some account, in order to keep up the method of bookkeeping, wouldn't it?

A. My recollection is some of the roads use the revenue basis on that; the proportion between freight and passenger revenue.

Q. Divide it on the earnings basis?

A. Yes, sir.

Q. Isn't that the pretty general rule in the absence of some other——

A. Yes. I believe it is.

Q. Now, that is a pretty considerable item too, on some large roads?

A. Yes, it is quite an item.

Q. Is there any better method that you can think of for dividing that, than that manner; understand, it is incapable of divis-

2683 ion except in some arbitrary manner, do you know of any better method than that?

A. No, as far as earnings is concerned, I believe the dividing of earnings on earnings is about as close an approximation as you can get.

Q. We are speaking now of expenses; is it indivisible in any other way?

A. Yes, in a general way between freight and passenger.

Q. When you went back to the Houston & Texas Central from the Southern Pacific service, what time was that?

A. In May 1903.

Q. What duties did you discharge with that road, from that time on?

A. As chief clerk in general and disbursement accounts, practically in the same position that I had held previously.

Q. You were brought very little in contact with divisions, I suppose?

A. Yes, except at this later date, the company had gone into then, the more extensive manner of working up statistics, showing these divisions between freight and passenger, as we had not done when I was first connected in that capacity.

Q. Were your duties with regard to them, were they the same as they had been before, in recording and entering and of a clerical nature?

A. Yes, sir, except that they were more extensive than before we had established these statistical bureaus.

2684 Q. There was some more minute divisions, I suppose you mean, the division extended perhaps in more directions?

A. Yes, that is what I mean.

Q. The duties were multiplied in that way?

A. Multiplied by having compiled statistics of this character that we had never had before.

Q. Your duties were of the same nature, carrying out in a clerical way, the rules, whatever they were, that you found established there?

A. The rules we found established there, and the rules that we made from our own notions, based on the conditions as we saw them.

Q. What were your methods in freight and passenger divisions I would like to have you state it in a general way?

A. The method was the engine mileage, and train mileage and car mileage.

Q. What did you divide on the basis of engine mileage?

A. Principally the maintenance of way expense, and then under maintenance of equipment, locomotive expenses.

Q. And on the car mileage, what did you divide on car mileage?

A. The principal expense there represented is the repairs of cars.

Q. What were the other units you mentioned, that is the engine and car,—what was the other?

A. Train mileage.

Q. Revenue train?

A. Yes, sir.

2685 Q. And what was divided on that basis?

A. The revenue train mileage was applicable mostly to transportation expenses and general expenses.

Q. What is the length of that road, the Houston, Texas & Central?

A. 791 miles, is my recollection.

Q. What is its termini.

A. Houston to Dennison, that is considered the main line.

Q. What are the different kinds of expenses embraced in maintenance of way and structure accounts?

A. Mostly repairs of roadbed, and track, as bridges and buildings, fences, road crossings.

Q. What is it that produces the necessity for a large amount of repairs, of that kind, is it produced by wear and tear of passing of trains or from other causes?

A. I should say, an operating official would be better able to answer that than I could; I would imagine that wear and tear would be the principals.

Q. You would imagine wear and tear would be the principal causes of the necessity of repairs?

A. Yes, sir.

Q. You don't profess to be an expert on that subject?

A. No, sir, I would just answer that generally.

Q. Is it on that idea that you think that the expense should be divided on the basis of the total engine and car miles?

A. Yes, sir.

Q. That is the reason why you think so. I want you to tell me your reason for thinking that any per cent at all should
2686 be added to the engine mileage of local trains, and for what purpose it should be added? Why do you think that is proper?

A. I testified in respect to that, that I did not feel qualified to be able to state any reason for such addition, that in a general way, that would be considered right.

Q. You would have no independent opinion based on your own experience of that?

A. No, sir.

Q. You never operated a locomotive, did you?

A. No, sir.

Q. All your knowledge of locomotive operation is from keeping books in the office, I suppose?

A. Yes, sir.

Q. Do you feel qualified from any experience you have ever had, in connection with railroads, to form an independent opinion of your own, as to what would be a proper basis of dividing the expenses incident to locomotives, locomotive repairs?

A. Well, it would only be based on the practices that I have seen followed.

Q. That is what I mean?

A. Those practices that have been followed—reached after consultation with officials of the operating department.

Q. And whatever opinion you have of it is based upon your belief in the competency of others who were more familiar with the subject, to adopt proper methods? That is a fact?

2687 A. Yes, sir, and the practices I have seen.

Q. And it is not based on your judgment, derived from your own experience?

A. I have had no experience in that line, to arrive at any judgment.

Q. You wouldn't have an independent judgment of it, outside of the practices upon which you say you based your opinion, would you?

A. No, sir.

Q. Now, for instance, in making up the statement I had before me, to which your attention has been called, 50% has been added to the mileage made by yard locomotives, to provide for possible extra maintenance due to yard service, and then 50% more has been added to the mileage of road locomotives in local service to provide for possible extra switching mileage, and then again, 50% has been added to that switching mileage, to provide for possible extra maintenance due to switching service, being in the main 75% additional. If you were called upon to make a division of that, and to make provision for any extra service based on any knowledge

that you have as to the incidents of the service, you couldn't do it, could you?

A. I could probably do it if I had opportunity to give it sufficient time and study to look into different conditions.

Q. You haven't had that up to this time?

A. No, sir, not in this case.

Q. And for that reason, you wouldn't feel qualified to say whether that basis is correct or not, without having an opportunity
2688 to give it more investigation and study than you have up to this time?

A. Yes, sir.

Q. You say you would or would not?

A. I would not want to qualify.

Q. Have you made any study of Mr. Wellington's book of "Railway Location"?

A. No, sir, I have not made any particular study of it.

Q. Have you read the book through?

A. I have read the book, part of it.

Q. How long ago was that book prepared?

A. The edition that I saw was first prepared way back, I think in 1881 something like that; it has been brought down to more recent date though.

Q. You spoke about new methods that were adopted by the Houston & Texas Central Railway when you went back there the second time; they involved a good many changes in the method of dividing and proportioning these expenses, didn't they?

A. I won't say they made any cha-ges, because they have never had any system of division before that time, at all.

Q. When was that, the period you speak of, when you went back there?

A. 1903.

Q. At the time Mr. Wellington wrote his book along about 1880 or 1881, somewhere along there, there wasn't really any general method adopted and there was very little experience in determining, among railroad officials, in making divisions of that sort.

A. This did not have reference—at least, Mr. Wellington's
2689 book has no reference to divisions between classes of service.

Q. I understand that this quotation from it does not, but what I want to know is whether these divisions were recognized and adopted, whether railroad officials had experience in making them, at the time that book was first prepared by Mr. Wellington, without regard to whether he treated of the subject or not. I want to get information as to whether that method was in effect at the time he wrote that book?

A. I should say, from what I have read that at that time, probably there was methods observed of division.

Q. I misunderstood you then, I thought you said there was no method.

Q. You asked me directly in respect to the line I was with—at least, I understood it that way.

A. Have you any idea from your reading of Mr. Wellington,

upon what he based this statement of 21.5% of the repair expenses of freight should be allowed, and that on account of starting and stopping at way stations, 13.5%, on account of terminal handling.

A. No, I didn't give that any particular study.

Q. You don't really know what ground he bases that on, do you?

A. No, sir.

Q. What do you understand, from your own knowledge and information, to be the difference in the amount and extent of terminal handlings, that is, between through and local trains, and traffic that is carried on through and local trains?

2690 A. The difference in the terminal handlings?

Q. Yes?

A. Well, I don't feel able to qualify to be able to enumerate any differences that may occur in handling of traffic at a terminal, other than to state my belief in a general way, that is practically more at a terminal for handling local service.

Q. What is that opinion based on?

A. Based a good deal on conditions as I have observed them, I would say.

Q. What have been your opportunities of observation in that respect?

A. Visiting around at stations, seeing trains made up.

Q. Do you mean visiting stations in an official capacity?

A. In both.

Q. What occasions have you had occasion to visit them in that way?

A. I have had occasion to go to stations for the examination of their accounts, and verification of agents' accounts.

Q. What opportunities on such visits did you have to observe the method of handling trains, and any differences that might exist as between the two classes of trains?

A. Only in a general way.

Q. Just as any other passer-by or person who happened to be there might observe it?

A. Yes, sir.

2691 Q. What character and different kind of expense—expense of maintenance of way—is included under the item of "supervision and general"? It is near the bottom of the page on exhibit K.

A. Under "maintenance of equipment"?

Q. Yes. Tell me the different kinds of expenses included in that. What are the different kinds of expenses embraced under the sub-head of "supervision and general"?

A. Well, not having compiled this exhibit, I would not be able to state what is included in that item. I would have a general idea, taking the classification of the Interstate Commerce Commission, what it is intended to cover. I can give you that if you want to take the classification.

Q. What is meant by the term "direct" charges for the "maintenance of equipment" used in that connection?

A. I would understand that to mean the charges located, direct to any particular account.

Q. I do not know that I understand what you mean by "located to any particular account"; make that a little more definite and tell me what you mean by that, please.

A. I would mean by "located to a particular account" for instance, the repairs of freight cars being located directly to the account covering the class of "freight car."

Q. Speaking of that, can you locate repairs to freight cars as between local and through trains?

A. The only basis that they have followed is by taking
2692 the car mileage of cars in a local train in proportion to the cars in the through train.

Q. What is it that produces the necessity of repairs of freight cars?

A. The particular necessity is the wear and tear occasioned by the distance that these cars travel. That is the greatest element.

Q. One of the elements, then, is the length, you might say, of the journey the cars make?

A. Yes, sir.

Q. Now, I suppose another one is the weight of the car and its contents—the weight of the contents.

A. Yes, that would have an effect.

Q. What would be the difference, or would there be any difference in your judgment, in the wear and tear upon a car hauling sixty tons of freight and one that is hauling five tons.

A. There is bound to be a difference, but it is unlocatable from the fact that the car may today be in the service of carrying sixty tons, and may be tomorrow it may get a rest and carry five tons. It would be hard to locate any great difference.

Q. If either branch of service is characterized by a heavier loading, that is to say, if the cars in the local trains were twice as heavily loaded as the cars in the through trains, or vice versa, as a
2693 rule; and if the loading of the cars effects to any extent the wear and tear, would you think it proper to make an allowance on that account?

A. Well, an allowance might be considered, but it would be so small that I do not think for the purpose of an approximation it would be necessary.

Q. You recognize this simply as an effort to approximate: you do not regard it as anything more?

A. An effort to approximate it.

Q. What is included in "station expenses" under the head of "transportation expenses" referred to in this exhibit on page 4?

A. "Station expenses" as this term applies here, would include the wages of agents and their clerks, warehouse watchmen, laborers, operators——

Q. If a large proportion, say one half of the tonnage of one or both of the railroads which are engaged in this litigation, should be of a character that did not require that service, do you believe that the method of division adopted here would be correct?

A. Under those circumstances this would not apply.

Q. What is "yard and terminal expense" under the general transportation head?

A. That generally includes the expense of the switching engine; switching crew; fuel and supplies for the engine.

Q. That is divided on the basis of the number of cars
2694 handled?

A. Yes, sir.

Q. Suppose the character of service rendered to the cars engaged in different classes of traffic were materially different, and that difference ran through and characterized the classification as applied to the cars engaged in the traffic; would the number of cars handled properly reflect the difference of the expense?

A. As near as could be obtained.

Q. Possibly as near as could be obtained, but would it correctly reflect the relative expense?

A. It would be such close approximation that there would hardly be any difference——

Q. Just to illustrate: suppose we take a case of two cars: one of those cars is handled simply by detaching it from one train and attaching it to another; practically one movement.

Another car would require three movements maybe:

Would you say that it would be correct to apportion the expense incident to that part of the service between those two cars on an equal basis? Just simply to say, here are two cars and we will divide it equally between them.

A. Not if those were the actual conditions that existed in connection with each car.

Q. What are the elements that enter into and control the relative consumption of fuel and engine supplies on different roads?

2695 A. I would say that the length of run of the locomotive would be one of the elements. The capacity of the train would no doubt have another large effect on it.

Q. In what way would those considerations affect it?

A. The fact of the train running a greater distance, I think even to the layman's mind, would bring about the additional consumption of fuel.

Q. Those things, I suppose, differ on different lines of road, too, do they not?

A. Oh, yes.

Q. What is your observation or do you know about the fact of their being a difference in the character of service in the respect mentioned by you on different lines of railroad.

A. I do not feel qualified to make any statement in respect to that, hardly.

Q. Would you feel that you could ascertain and determine the relative consumption on one line of road by ascertaining what the relative consumption had been on another line of railroad at a different time, for a different period?

A. I do not know that I could. I think an operating official could.

Q. Do you believe that would be a fair basis of determining the question as to the road upon which the——

2696 A. If any one making the assertion that the conditions are the same would be thoroughly familiar with the conditions in each instance, I would imagine that would be satisfactory.

Q. It depends on conditions of that sort, I suppose?

A. Naturally.

Q. Do those things vary at different periods on the same line of railroads?

A. I should judge they would.

Q. You would have to assume, in order to take on the same road the consumption at a given period—you would want to test it by the same period, at least by a period when the character of traffic with reference to the volume that entered into it was similar, would you not?

A. Yes, to obtain results, I would.

Q. It would be still more important, would it not, in testing one road by the performance on another, to know that the conditions were similar, would it not?

A. It certainly would.

Q. What are the heavy traffic expenses which you think would be chargeable entirely to interstate traffic.

A. Principally the outside agencies, termed "foreign agencies" located off the line of railroad—take, for instance, a line running through Arkansas that would have a large Eastern agency in New York, Philadelphia, Pittsburg—manufacturing centers where they maintain large, and frequently very expensive offices, to obtain traffic for these lines.

2697 Q. You assume, I understand, that the service rendered by those foreign agencies have no effect upon the intrastate traffic and base your view upon that assumption: is that correct?

A. That is the idea.

Q. What are the duties, generally, of these foreign agents?

A. I would say that is their principal duty, the soliciting and obtaining of traffic.

Q. You mean by that, traffic that goes—we will say from one section of one State into another section of the country or state.

A. Traffic that practically goes from the territories that they represent. They represent territories in these manufacturing interests.

Q. Let us assume that each of these railroads engaged in this litigation have an agent in Chicago for the purpose of soliciting traffic: that agent will solicit traffic that will probably be carried from Chicago to various points in Arkansas?

A. To various points in Arkansas and even beyond.

Q. We will say the State of Arkansas.

A. Yes, sir.

Q. And, on the other hand, he will solicit traffic that will involve a movement from Arkansas to the territory which he repre-

2698 sents his companies in: that is true, too, is it not?

A. To some extent, yes, sir.

Q. Do you say that the traffic that is influenced in that way does not affect intrastate business in the State of Arkansas?

A. It is interstate business if it moves from this territory into Arkansas and it is certainly interstate business if it moves from Arkansas into this territory that he represents. I do not see how you can charge it to intrastate in any way.

Q. Suppose you are an agent of the Cotton Belt Railroad in Chicago and you are able to influence a shipment of one hundred car loads of freight to points on that line in the State of Arkansas: after that freight is carried to Arkansas what becomes of it?

A. After it is carried into the State of Arkansas?

Q. Yes. Is it not distributed on local trains and to local points in the State?

A. Not necessarily on local trains; or, or at any rate, it would not be considered local traffic regardless of the train it was on. It would be interstate traffic regardless of the distribution after it reached Arkansas.

Q. So you do not think it affects the local business at all?

A. No, sir.

Q. Have those agents any other duties to perform besides
2699 soliciting freight?

A. That is the principal duty. I doubt if they have any other.

Q. Are there agents for the purpose of soliciting immigration into the State and procuring industries to be located in the State?

A. Yes, sir.

Q. Do they have any influence on local traffic in the State?

A. Not as far as this foreign agent is concerned.

Q. You do not think that should be made a charge on intrastate traffic?

A. No, sir.

Q. I want you to explain to me, Mr. Fitzgerald, what you understand the method is of dividing train costs adopted in these exhibits; just explain to me, please.

A. As I understand it, they have obtained the actual cost of the local and through trains. They have apportioned that to intrastate and interstate on the basis of the number of tons carried, of each respective class of freight.

Q. In other words, it is apportioned between state and interstate business on the ton mile theory, is it not?

A. On the ton mile theory.

Q. Do you regard the ton mile theory as a proper theory of apportioning the expense of state and interstate traffic?

A. I regard it as the nearest applicable unit that affects
2700 the train service generally.

Q. Is the expense of handling and moving different kinds of tonnage uniform, or is there a difference in the different classes of traffic?

A. Taking the different classes of traffic as a whole, my idea is that moving a ton per mile, there is very little difference as a whole.

Q. Does the length that it is moved have any influence upon the cost per ton per mile of moving it?

A. I should say not a great deal as between the two different classes of traffic for the reason that they are moved on local and through trains. The fact of the two different classes of traffic moving on both classes of trains would bring about very little difference in the final results of the cost per ton per mile, in my opinion.

Q. You know we have problems of this sort on averages to get down to a basis: if you knew that the average length of the haul of the intrastate freights were—we will say fifty miles, and the average length of haul of the interstate was 150 miles, you would take that as indicating the average difference of the service insofar as the length of haul was concerned, would you not?

A. No, as I say, the fact of the different classes of freight moving on both kinds of trains, I do not believe that there would be any great difference.

2701 Q. In the question I asked you we are not dealing with the difference in train costs, but in the difference of the cost of handling state as against interstate.

A. Yes, I understand that.

Q. Now, if the average length of haul of the two kinds of traffic, were as I stated a moment ago, respectively 50 and 150 miles, you think that would not influence the cost of the service of moving the two kinds of traffic?

A. Not when it comes to arriving at the average per ton per mile, no. I do not think it would influence it to any noticeable extent, in the average.

Q. You think the cost would not be influenced, either, by the difference in the character of the tonnage?

A. I do not see why the difference in the character of the tonnage would have any effect, on the same class of tonnage.

Q. What I mean is this: interstate traffic is made up of a great variety of different sorts of commodities and different classes of freights:

The state traffic is also made up in the same way:

What I want to ask you is this: have those differences an effect in determining the relative cost as between the different kinds of tonnage carried in both state and interstate traffic?

2702 A. Yes, I should say they would, if the conditions brought about so that there was a different commodity that required a heavier train expense, it would result in a different average.

Q. Would it cost as much per mile to move a car load of brick one hundred miles as it would to move it twenty five miles?

A. I have never been able to get any cost on the moving of any particular commodities.

Q. How are the rates affected by those two distinctions? would it have an influence on the rates?

A. No, I do not think the rates are governed by——

Q. The rate diminishes in proportion as the distance increases, does it not, in railroad transportation?

A. That does not always govern, the distance.

Q. What is the general rule in state traffic?

A. I do not believe there is any general rule followed. The general rule is to go out and get the business regardless of what you have to—that is, on interstate traffic.

Q. I am speaking of state traffic.

A. Well, in state traffic probably the distance would be considered, of course.

Q. It is a minor quantity, though, is it? Is that what you mean to say?

A. No, it is not a minor quantity; not as much so as in the interstate.

2703 Q. Did I understand you to say that railroad rates were not adjusted with reference to the cost of the service that is incident to the handling of the freights?

A. I would say that generally speaking. I am not a rate man, though, and not qualified to say what the basis of rates are; but generally speaking——

Q. How do they manage to keep railroads running if, they do not have some reference to the cost in adjusting the compensation for the service?

A. Their guesses have been on the right side, I suppose.

Q. Then, you think that railroads are different in that respect than all other industrial and commercial concerns?

A. To a greater extent, yes, than the commercial business.

Q. There is no relation between the adjustment of rates and the cost of the service? Is that what you say?

A. I did not say there was none. I said that it was seldom considered or not often considered.

Q. Then, if it is not often considered, that practically means that the rates are adjusted without reference to the cost, does it not?

A. Yes, sir.

Q. In that respect, would you say that that is true of industrial and commercial business, usually?

A. I have never had any experience in any other line of business. I would not be qualified to say what they do, generally.

Q. What is your idea about a man that is manufacturing brick, for instance, or cloth? Does he not adjust his price somewhat with reference to what the cost is of producing the thing he has to sell?

A. Yes, and he can very likely do that.

2704 Q. Do you think that the railroads disregard in their rates, those conditions that would be regarded by the man engaged in manufacturing?

A. No, I would not say that. I think that as a prime instance, they, of course, consider distance and cost, but they get away from that when they are making rates on a great deal of their business. I do not say that the railroads do not consider that entirely. That would be going too far.

Q. Mr. Fitzgerald, to go back for a moment to that ton mile theory: what is your view as to the relative cost per ton mile of moving or transporting a heavy and dense article—we will say brick

or heavy steel rails; those being articles that are not easily susceptible to damage and in respect to which there is very little expense in the way of loss and damage—as compared with the cost of moving light and more valuable commodities, we will say baskets. Let us compare baskets with a car load of steel rails or brick:

What is your idea of the effect of the difference in the characteristics of those two kinds of freight, upon the expense per ton mile of moving it?

A. There are certain conditions in the movement of one class there that are probably off-set by conditions in the other that it would be hard to be able to tell what the differences would be.

Q. So, in your judgment, when you even it all up, those differences would not affect the fairness of the application of the ton mile theory? Is that your idea?

A. Yes, sir.

2705 Q. You stated in answer to a question propounded to you by Judge Hill, that the arbitraries that were allowed in the exhibits, in this case by Mr. Wharton, provided for the difference in the expense of moving state and interstate traffic:

Please tell me what those arbitraries are that you had in mind in making that statement.

A. Well, these arbitraries here—this is fifty per cent added to local engine mileage in station switching; the engine mileage multiplied by two and one half to get the equivalent in car miles; extra mileage added under locomotive repairs.

This item under freight cars of approximation arrived at by Mr. Wellington.

The mileage added for stopping and starting expense. All the way through here.

Q. Do you think those allowances for arbitraries would cover the difference in the cost of handling that may exist in the expense of handling state and interstate traffic?

A. I would say, at first glance, without being able to study the conditions that exist in each instance, that they appear to me to be fair. That is only in a general way that I would say that.

Q. Have you had sufficient experience in transportation and in the operation of trains to qualify you to judge of that, do you think?

2706 A. No, that is why I qualified my testimony by saying that I believed an operating official could more thoroughly pass on that and explain it.

Q. You do not claim to be competent to pass upon those questions?

A. No, sir.

Q. Mr. Fitzgerald, I understand from your statements that your experience in connection with railroad accounting has been confined to Texas roads, has it not?

A. Yes, sir, it has.

Q. Have you had any experience in dividing expenses between states?

A. No, the only experience I ever had in that respect was the

time that I have shown that I worked for the Southern Pacific, where we had a line in Louisiana and Texas, for which we had to make an Interstate Commerce report. The expenses then were divided arbitrarily, unlocatable expenses being divided on a mileage basis, road mileage and train mileage.

Q. Is that the extent of your experience?

A. Yes, sir, as between states.

Q. Who prescribed the method of division that was adopted in that case? I mean what official of the railroad?

A. I do not recall.

Q. What connection did you have with it, Mr. Fitzgerald?

A. Why, I was voucher clerk at that time.

2707 Q. You simply did the clerical work?

A. Yes, sir.

Q. Have you ever had occasion to give any careful consideration to the revenue basis of dividing expense between states, and between state and interstate?

A. Not in my railroad experience, I never have had. Since then I have studied the question some.

Q. When did you first see the formulas that were contained in these exhibits that were filed by Mr. Wharton in this case?

A. At the time they were offered in evidence here.

Q. Some two weeks ago?

A. Yes, sir.

Q. You had no opportunity to study or consider the methods that were adopted there prior to that time?

A. No, sir.

Q. Your statements are based upon the knowledge acquired in respect to them since the exhibits were filed in this case? Were you here at the time those exhibits were filed, some two weeks ago?

A. Yes, sir.

Q. Did you go back to Texas?

A. Yes, sir.

Q. Did you resume your work in connection with the Texas Commission when you went back?

2708 A. I did to a certain extent, but at the same time devoted a good deal of time to the consideration of the facts as shown in these exhibits.

Q. And that is the extent of your acquaintance with the methods adopted there, such thought as you were able to give it during that time?

A. Yes, sir.

Q. You stated on your examination in chief that the gross ton mileage was equivalent to the engine and car miles, I think: in what way is that correct?

A. I meant they were practically in the same proportion for the reason that taking the engine miles and the car miles we have everything except the tons in the train and the weights of the engine, and those would probably fluctuate in the same proportion. That is what I meant by that. They would be greater, but they would naturally fluctuate in probably the same proportion.

Q. You think that would be true of the contents of each train, Mr. Fitzgerald?

A. Very nearly so.

Q. And for those reasons you still maintain that the engine and car miles would be equivalent to the gross ton mileage?

A. In approximation it would bring about very nearly the same results, I should say.

Q. Did I understand you to say that in your opinion the
2709 revenue basis of a large portion of the expenses of a railroad which you placed at sixty percent, goes on regardless of the revenue and that part of the expense does not depend in any way upon the volume of traffic?

A. Yes, sir.

2710 Redirect examination.

By Mr. HILL:

Q. In discussing with Mr. Moore the division of miscellaneous revenue, I understood you to say that you had no objection to dividing revenue on revenue.

Mr. Moore asked some question about expenses which I did not quite catch: I will ask you if you made any statement about dividing miscellaneous expenses by miscellaneous revenue?

A. No, sir, I did not understand his question to have any reference to any expenses whatever.

He started out, as I recollect, in dealing with the division of miscellaneous earnings and my idea was that it would be proper to divide revenue on revenue, and that is really where I intended to stop.

Q. You mean the common?

A. Yes, the miscellaneous.

Q. Which is not definitely located?

A. Yes, which is not definitely located to anything on the relative proportion of the other earnings that are located.

Q. You did not understand any question about the division of expense on that?

A. Not in that connection, no, sir.

2711 Q. Mr. Moore asked you some question about how much of the wear and tear on tracks was due to the passing of trains: I do not recall your answer about it:

I want to know if it would affect your opinion as to the division of maintenance of way on car mile basis, whether a large or a small part of the expense of maintenance of way was due to natural causes like weather or wind?

A. No, sir, I hardly think it would. The prime motive is there to carry these expenses, these outside expenses, we will say, that are affected by other elements. They are there for the purpose of maintaining the track which is affected by the car mileage, we will say. For that reason I don't think that any material difference would be made there.

Q. As I understand you, it is a question of the up-keep of the plant for the use of the train and whether the expense incurred in

that up-keep is due directly to the use of a plant by the trains or by natural causes that that would not make any difference in dividing the expense on a car mile basis: is that correct?

A. I would answer from the experience I have had with roads adopting the engine and car mile as a basis for maintenance of way expenses, as a whole, that would make no difference what would be the cause.

Q. Mr. Moore questioned you about items in the exhibits under the head of "Supervision and General" and asked you what was included therein: What did you understand was included
2712 in those items of "Supervision and General"?

A. From the terms used on the statements or exhibits, I would take it that the expenses falling under those heads as prescribed by the Interstate Commerce Commission classification have been followed.

Q. Mr. Moore questioned you about whether you had had any experience in your railroad work of dividing expenses between state and interstate:

I will ask you if you have had occasion to consider, investigate and study that question since you left the railroad service?

A. Yes. While in the railroad service the question had not been considered or worked up to any great extent, but since I have been with the Commission we have considered and studied that question to a great extent.

Our conclusions in that respect have been to start with obtaining the unit of revenue on each class of commodity. We have made changes in our reports for this year on that basis and that is as far as we have gone, the intention being not to make any changes in connection with the expenses until we are more satisfied as to a plan that might come nearer bringing an approximate result.

Q. You mean, that you are trying to find out from the railroads the cost and the revenue on given commodities, is that it?

A. On given commodities.

2713 Q. That is what you are now working on?

A. On different commodities and classes of traffic, both local, intrastate and interstate, and we have formulated a plan for that.

Q. So this question of division between state and interstate is a pretty live question before your Commission right now, is it not?

A. Yes, sir, very much.

Q. Mr. Moore questioned you about how much time and consideration you had given the exhibits in this case and you answered him and in your answer you explained what time you had given:

I will ask you if there is anything in these exhibits that a railroad accountant is not in general familiar with? That is, are any bases used that are not familiar to railroad accountants?

A. Eliminating the percentages that have been added arbitrarily I don't see that it requires any considerable time to reach a conclusion in respect to the bases that have been used, owing to the fact that they are so generally adopted and in practice.

Q. These are largely elemental bases in railroad accounting, are they not?

A. Yes, sir.

Q. I believe you stated either in your dierct or cross examination, that the constant expenses, or a large percentage of the expense of a railroad company, irrespective of the volume of traffic: have

2714 you any authority or reason upon which to base that statement?

A. Yes, sir, I obtained that from a work here that I have that is considered an authority on railroad matters.

Q. What is the work?

A. It is entitled "American Railroad Rates," by Walter Chadwick Noyes.

Q. I wish you would read into the record his statement on that subject, on which you relied in giving your testimony, giving the page.

Mr. MOORE: I wish to enter an objection to that because I do not think it is competent.

A. On Page 17 there are tables showing the different classes of expenditures and "proportion of constant expenses to total expenditures" and "Proportion of fluctuating expenses to total expenditures."

Under the first heading is shown:

"Fixed charges.....25%
General Expenses..... 3%
Maintenance of way and structures.....10%
Maintenance of Equipment..... 7%
Conducting Transportation.....14%"

That aggregates 59% and I merely used 60% as an average in my statement, not recollecting the exact figures.

Q. You had in mind the authority that you quoted in making that statement?

A. Yes, sir.

2715 Q. Is that a recognized authority on the subject?

A. It is, as I understand it, yes, sir.

Q. Mr. Fitzgerald, Mr. Moore questioned you about the use of a ton mile theory, as he called it, of dividing expenses: I would ask you if the ton mile division here in these exhibits between state and interstate, after these various expenses have been worked out as shown in the exhibits, is the ton mile division of expenses as commonly understood when it is referred to as the "ton mile theory"?

A. No, I would take it not; that the ton mile theory is most probably meant to be the using of ton miles only, applicable to the total expense.

Q. Where does this differ from that?

A. This differs in the location of certain items actual before you make this division.

Q. And the location between different classes of train service, too?

A. As well, making it, in my opinion, a closer approximation than if we apply the ton miles as a whole.

Q. In your opinion, is this a closer approximation of an actual condition than the use of the ton mile as it is commonly done?

A. Yes, sir.

Mr. MOORE: I will ask you not to put your questions in such a leading form, Mr. Hill.

2716 Recross-examination.

By Mr. MOORE:

Q. With the exception of the location of certain items mentioned in your last answers, is not the method adopted by the state's accountants in the exhibits in regard to which you have been testifying, the ton mile theory of division of expenses between state and interstate traffic?

A. The ton mile theory—I don't quite understand what you mean.

Q. You have heard the expression "ton mile theory" and "revenue theory," and perhaps others spoken of, respectively, as bases for dividing expense of operation between state and interstate traffic, have you not, Mr. Fitzgerald?

A. You might term it a ton mile theory in so far as the exhibits show that it treats with certain expenses. It shows for itself.

Q. You stated on your re-examination that the division made in these exhibits was not the ton mile theory and when asked to state the difference between the division that is contained in these exhibits and the ton mile theory of dividing expenses, you said that it was in the fact that certain items of expense have been located in these exhibits:

The question I ask you is, if with those exceptions—aside from those exceptions, is not this method of division made on the basis of ton miles?

2717 A. Yes, I would say, making those exceptions, that it is.

Q. What part of the "miscellaneous revenue" did you have in mind in the statement referring to that part of it which is not located?

A. Those items that are enumerated, such as miscellaneous earnings not applicable to——

Q. I know, but this afternoon you spoke of certain parts of miscellaneous revenue that could not be located: I wish you would point out what proportion or what part of miscellaneous revenues it is that cannot be located as between state and interstate traffic?

Mr. HILL: I did not say state and interstate.

Mr. MOORE:

Q. What part of it is it that cannot be located?

A. As between what?

Q. I am asking you what you refer to, if not between the two classes of traffic we are discussing, then what are the classifications between which it cannot be located?

A. It cannot be located between the classes of traffic or classes of service, a good deal of it.

Q. There is not any part of the "Miscellaneous revenue" that cannot be located for the purpose of determining whether it accrued from the state business or from the interstate business, is there?

A. Well, I would have to go over the detail of classification
2718 of operating revenues to answer that.

Q. Have you had any experience as to the division of expense of "Maintenance of way" between local and through trains?

A. Division between local and through trains?

Q. Yes?

A. Have I had any experience?

Q. Yes.

A. No, sir.

Q. You have not?

A. No, sir.

Q. You stated that in your experience in dividing "Maintenance of way expense" the car miles had been used: what was the character of the division to which that was applied to, Mr. Fitzgerald?

A. Division between freight and passenger.

Q. You referred a while ago to the division of general expense and expense of supervision, under the head of "Maintenance of way" prescribed by the Interstate Commerce Commission which you say is followed: what is the division prescribed by the Interstate Commerce Commission?

A. I referred to it being analagous to the general shop expenses under "Maintenance of Equipment" prescribed by the Interstate Commerce Commission as being chargeable over the various accounts that are affected.

Q. Do you know how the Interstate Commerce Commis-
2719 sion treats that item of expense "General & Supervision" under the head of "Maintenance of way" in the matter of dividing it between the various branches of service?

A. Only in a general way. I have not had the recent rulings.

Q. What is your understanding about that?

A. That the general shop expenses are divided over the accounts affected according to the work that is done of each account.

Q. What shop expenses enter into "Maintenance of way" matters?

A. Not "Maintenance of way"; this referred to "Maintenance of Equipment" this supervision that you speak of.

Q. You referred to an order of the Railroad Commission of Texas, made with a view of dividing expenses as between state and interstate traffic. That order was enjoined by the Courts down there, was it not?

A. I was not speaking of an order in reference to a division of expenses. I referred to an order respecting—not an order either, but the consideration that we have been giving a division of revenue; that was what I referred to. I did not say anything about expenses.

Q. Division of revenue?

A. Yes, sir.

Q. Explain that a little more fully?

A. Judge Hill asked me if we had given any consideration
2720 to the question of division of expenses between state and interstate service. I replied that we had the matter under consideration and had been giving it a great deal of study. That we had, however, only reached so far, the division of the revenue. That now that we have reached the division of revenue we expected later to obtain some bases for the division of expenses in order to obtain the net.

Q. Have you adopted a plan for the division of revenues as between those two lines of traffic?

A. Yes, sir, we have adopted one.

Q. What is that?

A. It is a division between actual—an actual division of freight transportation by commodities, showing it between local, intrastate and interstate.

Q. Does not that divide itself?

A. Yes, sir, that will divide itself.

Q. It does not require any consideration or plans to divide that?

A. It does not require any plan, but we put the plan into effect. It is a question of obtaining the result from that plan.

Q. You say the basis of division contained in the exhibits that have been discussed today are familiar to accountants and are largely elemental: has that basis been used for the purpose of dividing expenses between local and through trains, or has it been
2721 used for the purpose of dividing between freight and passenger and on lines that cover more than one state, between states? Is that not the way on which those bases have been used heretofore?

A. They have been used, in the experience I have had, as a division between freight and passenger.

Q. Mr. Fitzgerald, I wish to call your attention to the volume you introduced a while ago and from which you quoted, "American Railroad Rates" by Noyes, and ask you if at Page 37, he does not make this statement in regard to the relation of the cost of service to the rate of transportation:

"1. The additional expense incurred in rendering the particular service—cost of service in its narrowest sense—determines the minimum charge and is consequently an element in fixing the rate. It is always important to ascertain that amount of tare—the proportion of dead to paying freight. Freight carried in half empty cars costs more than full loads. It is equally of consequence to know whether the cars can be returned loaded or must return empty. Other consideration which to a greater or less degree affect the actual expense to the railroad of moving the particular freight, and consequently enter into the rate, are (*a*) the bulk of the goods transported; (*b*) the weight; (*c*) the method of packing and protection; (*d*) the extent of the shipment and whether in carload lots; (*e*) the kind of cars required; (*f*) the necessary speed, and (*g*) the necessity for ice or heat. Mileage, of course, is also a most important factor."

Do you regard that statement of Mr. Noyes' as a correct representation of the conditions of which he is speaking?

A. Not being a practical operating man, I don't feel qualified to pass on Mr. Noyes' statement at all.

Q. I believe you stated Mr. Noyes' was recognized as an
2722 authority?

A. Yes, in making rates, as it is termed here. We have to accept this also, I suppose, but as far as I am concerned I couldn't pass on it.

Redirect examination.

By Mr. HILL:

Q. You spoke of the division on a ton mile basis here being the ton mile as used with the exception of those items as were actually located: what do you mean by the "exception of the items actually located"?

A. I meant that if you made those exceptions, why your basis was on a ton mile basis. That is, if you made those exceptions.

Q. Just what exceptions are you referring to?

A. All that are included in the exhibits.

Q. In "Maintenance of way" and "Maintenance of Equipment"?

Mr. MOORE: No, he read them this morning; 50% allowed in one place and 50% allowed in another.

The WITNESS: I enumerated all of them; all of the exceptions that are in the exhibits.

Mr. HILL:

Q. Here is the point I want to get at: I will have to put it as a leading question to make myself clear:

You mean by these exceptions those which are actually found, like loss and damage, wages and fuel, or do you mean exceptions of accepting these standard bases like "Maintenance of Way"
2723 and " Maintenance of Equipment"? I want to get your idea.

A. As I understand the question—would this be on the ton mile theory, as it is termed, if these other bases are eliminated?

Q. Yes, what bases were you referring to? That is what I want to get into the record.

A. I am referring to the entire exhibits; that if you eliminate everything there then you bring it down to nothing but a ton mile basis.

Q. I believe that you have already stated that having made these exceptions, that you got a more actual approximation than if you used a ton mile, broadly, so to speak.

A. I believe that, pertaining to a good many of the matters on the bases prescribed in those exhibits, brings about a nearer approximation.

Q. In referring to this division of unlocated expenses, "Miscellaneous revenue", say rent of buildings or something of that kind: was that division not the revenue on a revenue basis of these

unlocated items, between state and interstate or passenger and freight, or between some other classes of traffic?

A. What division do you refer to, Judge?

Q. The division of the unlocated "miscellaneous revenue": say, the rent of a building; common miscellaneous revenue.

2724 A. In what instance do you mean?

Q. In answer to Mr. Moore's question about how you would divide those unlocated items of "miscellaneous revenue" were you referring to a division between state and interstate or a division between freight and passenger? You testified you have known of it done on revenue on revenue?

A. I had in mind the division between freight and passenger. I think that the division between state and interstate would probably follow in the same line.

2725 HENRY WILLMERING, being recalled for cross-examination desposed as follows:

Cross-examination.

By Mr. MOORE:

Q. Have you the formula I asked you to prepare?

A. Yes, sir.

Q. What is your relation with the Oklahoma Corporation Commission?

A. I have been designated Auditor in charge of its Division of accounts.

Q. What are your duties?

A. My duties are to prescribe accounting systems under the direction of the Commission, for various public service corporations operating in the State of Oklahoma, and to analyze the returns made to the Corporation Commission of Oklahoma, the reports, monthly returns and annual returns, and to direct the compilation of statistics compiled therefrom, and my principal duties are to investigate all branches of public accounting bases, and to recommend to the Commission systems of accounts for public utility companies operating in the State of Oklahoma.

Q. Has the commission a rate clerk, an agent who has duties to discharge in connection with railroad business?

A. It has a man in charge of its Traffic Department.

2726 Q. Who is that man?

A. Mr. C. B. Bee.

Q. What are his duties?

A. His duties are to keep in touch with rate situations throughout the United States and particularly in Oklahoma; to see that all tariffs are properly filed in a systematic way, and to direct the filing of same; to keep posted on rate affairs throughout the country in general, and to assist the commission in prescribing rates for railroad companies operating.

Q. Has the Commission any other assistants in the discharge of its public duties besides its auditor and rate clerk?

A. It has a force of about twenty men.

Q. What are their duties, clerical principally?

A. They are assigned to assist Bee and myself, and to assist Capt. Lee, the engineer of the Commission.

Q. I believe you stated on your examination in chief, you began your first employment in connection with a railroad, as yard clerk of the Pennsylvania Company in the City of Chicago?

A. Yes, sir, in 1892.

Q. How long did you remain in that position?

A. Several months. The positions I occupied in the Pennsylvania service was yard clerk at the 55th Street Yard, and local car accountant at that yard office; afterwards, I was assigned to the downtown local freight office; I had charge of the reports issued to the auditor for waybills outbound; it was as a billing clerk
2727 that I entered the service of the Pennsylvania Co.; that was the extent of my connection with them.

Q. How long were you employed by the Pennsylvania Railroad in Chicago?

A. I believe a little over a year.

Q. How old were you when you began in their employment?

A. 21 or 22; I had some previous experience prior to that, but I have not put it into the record.

Q. I was going to ask you what your occupation had been before you took employment on the Pennsylvania Railroad?

A. I assisted my father in shipping grain and live stock from Iowa points; I was bookkeeper for him part of that time.

Q. What was the character of your duties as yard clerk in the Chicago office?

A. Ordinary duties assigned to a yard clerk.

Q. What are they?

A. Checking up the yard and trains that arrive in the yard, keeping a record of the arrival of cars.

Q. How long were you engaged in their service as yard clerk?

A. I couldn't tell you; my service with the Pennsylvania Co. was about a year and a half.

Q. What was your next service after yard service?

A. With the Wabash.

Q. I mean with the Pennsylvania; you enumerated two or three lines of work that you did there; what was the next one that you mentioned?

A. Local car accountant for the 55th Street yard.

Q. What were you duties in that capacity?

2728 A. The duties were to enter up the cars in a systematic way, in a record kept for that purpose, and indicate whether they were empty or loaded, and indicate the billing in the car record, showing the disposition made of the car, by symbols we used for that purpose.

Q. What was the next duty you spoke of?

A. Abstract clerk in the downtown office.

Q. What were your duties in that connection?

A. To report waybills forwarded, showing the different charges

and the prepay, and to strike a balance with the cashier on prepay, and on advance charges.

Q. That was your line of work with the Pennsylvania Co.

A. Yes, and the billing of freight.

Q. Where did you go when you left the service of the Pennsylvania Co., what was your next employment in connection with the railroad service?

A. With the Wabash Railroad Co.

Q. When did you enter that employment?

A. A short time following the time I left the Pennsylvania Co.

Q. That was in 1895 or 1896?

A. I don't recall the year, somewhere around about that.

Q. What were your duties?

A. My first assignment was clerk in the claim and tracing department.

Q. What were your duties?

A. In tracing shipments received and forwarded from Chicago and in looking up records generally, with relation to claims
2729 that were submitted for payment.

Q. How long did you continue in that service?

A. Less than a year in that particular desk.

Q. What change was made?

A. I was afterwards assigned to the cashier's department as bookkeeper.

Q. What branch of accounts were you employed in, in connection with those people?

A. Accounting for revenues, and compiling statistics to show the cost of handling tonnage there through the warehouse, and compiling statistical information with relation to station business generally, and preparing the payrolls for that station.

Q. You spoke of the warehouse—you mean the warehouse in Chicago?

A. Yes, sir, they were quite extensive; I think they had two or three hundred men working there.

Q. How long did you remain with the Wabash?

A. I remained with the Wabash,—I was made cashier, and I was an agent; I was with them until sometime in 1902 I believe.

Q. Until 1902 That was several years ago?

A. Yes, sir.

Q. What was your business as cashier?

A. Collecting revenues and accounting for them.

Q. The ordinary duties of that office?

A. Yes, sir, at a large station like Chicago.

Q. Were you located at Chicago?

A. Yes, sir.

2730 Q. Any special branch of the Company's service which engaged your attention?

A. What do you mean?

Q. Were you the general cashier or were you the cashier—were your duties as cashier limited to some department of the company's service?

A. Limited to the freight service.

Q. Did it cover all the departments of the freight service?
A. All revenues in any way collected in the City of Chicago.
Q. Those duties were local to the business of Chicago?
A. Yes, sir.
Q. In other words, you were the cashier at that station, and for the business transacted at that station?
A. I was held responsible for cash collected at that station and accounted for.
Q. Your duties were to account for, hold and take care of cash collected there. You disbursed it too, did you?
A. I remitted it to the treasurer of the company.
Q. Where and when did you act as agent on that line?
A. At Chicago Ridge, located in the outskirts of Chicago, interchange point with the Chicago Junction Railroad and Chicago & Western R. R.
Q. Is that in Chicago?
A. It is in the outskirts of Chicago.
Q. It was a local station there?
A. Junction point with the Belt lines.
Q. Your duties with those was as ordinary station agent?
A. Yes, sir, accounting for freight revenues and passenger
2731 revenues, and handling of tickets and express matters.
Q. The duties usually discharged by a station agent?
A. Yes, sir.
Q. And you were engaged in that service until 1902?
A. Yes, sir.
Q. In any other branch of service than you have enumerated?
A. No, sir.
Q. What road were you connected with after you left the Wabash?
A. M. K. & T., Missouri, Kansas & Texas.
Q. What was your engagement with that company?
A. My first assignment was as cashier at Cleveland, Okla., afterwards I succeeded as agent.
Q. Where is Cleveland in Okla.?
A. In Pawnee County, in the oil producing district.
Q. How large a place is it?
A. They had a population of about five thousand at that time; the maximum revenue was about $40,000 a month—it was one of the best stations on the M. K. & T. R. R.
Q. You were stationed at that place?
A. Yes, sir, I was local agent there.
Q. What is the *station* between local agent and station agent?
A. There is really no distinction.
Q. I suppose you discharged the duties of station agent?
A. Yes, only the duties are more extensive, and more responsible than those performed by station agents at ordinary local stations.
Q. That grew out of the great volume of business there?
2732 A. Yes, sir.
Q. Duties that were of the same character?
A. Yes, sir, only more extensive than those ordinarily performed by a station agent.

Q. You say that place had a population of four or five thousand?
A. It did at that time.
Q. What has it now?
A. It is a city of the first class now; it was recently made a city of the first class, and the requirement is 2500 under the Oklahoma laws; it is not as large as it was at that time.
Q. How long did you remain there in that service?
A. I resigned in May, 1907.
Q. What were your next duties in connection with railroad work?
A. Since my assignment with the Corporation Commission of Okla.
Q. When did you become connected with the Corporation Commission?
A. November, 1907.
Q. When did that Commission get organized and enter upon the discharge of its work?
A. In November, 1907; that was the beginning of the Commission, and the organization was, as far as the accounting and the statistical and accounting department is concerned, was under my direction.
Q. Your experience in disbursing the moneys of a railroad and in statistical work is confined to local agencies and local points
2733 that you have enumerated?
A. In so far as actual experience is concerned, I have always kept my ears and eyes open, as the fellow said, and kept informed on all branches of the service.
Q. What I am speaking about is your experience in duties that have been discharged by you in the employment of railroad companies?
A. Along lines I have indicated and testified to, yes, sir. Though I might say, since the beginning of the Commission, I have given all my time, attention and thought to this accounting problem, and have been diligently searching for the truth.
Q. Has the Oklahoma Commission been endeavoring to find some basis of dividing and apportioning expenses of railroad operation?
A. Yes, sir.
Q. Have they ever adopted any system?
A. They are at sea just like the accounting officials of railroad companies, they are Tyros, they are beginners.
Q. You have never been able to arrive at any satisfactory results?
A. No, sir, we can never get the accounting officials of the railroad companies to agree to anything or submit any proposition.
Q. How long have you been engaged in trying to arrive at the truth?
A. Ever since almost since the beginning of the Commission.
Q. Did the Commission submit formulas to the railroad or
2734 did the railroads have the matter left to them?
A. They submitted a formula; the first form was submitted to the accounting officials of the railroad company; it was similar to the one prepared by Commissioner Colquit of Texas; I think that was submitted to the Railroad accounting officials in the year 1908,

and it was entirely ignored;—that is, in so far as its effectiveness was concerned; there was no hearing, in connection with it.

Q. What was provided for in that formula?

A. Revenues were to be kept in three divisions; local intrastate, interline intrastate, and Oklahoma prorata of the interstate business, and there were various bases used for the division of expenses.

Q. Did you ever submit any other formula to them?

A. Yes, we had a hearing in May, 1909; the accounting officials failed to agree—prior to that, we had a conference in May, 1908; in May 1908, we had a conference with the accounting officials in which Mr. Selig of the Katy——

Q. It is not worth while to go into the details that occurred; I just want to know the results?

A. The results were that the accounting officials failed to agree.

Q. So there never has been any satisfactory results obtained yet?

A. We are getting very satisfactory results in a way now, from a revenue standpoint, but not from an expense stand-
2735 point.

Q. Have you a copy of the order that embodied that formula you spoke of, which was prepared by the Oklahoma corporation Commission?

A. I haven't a copy with me.

Q. Will you furnish me a copy?

A. I will. Which formula do you have reference to?

Q. The formula you spoke of as having been submitted, based on the form of the Texas Commission. *Q.* And the second one?

A. The second is our accounting order #201.

Q. Will you furnish me with a copy of that?

A. Yes, sir.

Q. And also of the formula you prescribed, similar to the Texas formula?

A. It was a tentative formula, submitted to the railway companies at that time; it was not a formal order.

Q. Could you obtain a copy of it?

A. I think so. I will try it.

Mr. HILL: We will object to that.

Mr. MOORE: We will settle that after he has furnished it.

Q. Have you ever had any experience in operating a railroad as an operating official of a railroad?

A. Define the word "operating official," and I will be able to tell you.

Q. The sense I used it in, any experience that brought you in contact with the practical operation of a railroad?

A. Yes, agent of the M. K. & T., at Cleveland, Okla.

2736 Q. What did you learn in regard to railroad operation?

A. I learned facts in regard to the operation of local and through freight trains, and passenger trains from every day observation, and every day experience.

Q. If you have enumerated all your experience, you have never had any experience as an operating official?

A. I merely executed the orders of the operating officials.

Q. You never acted in any capacity that connected you with the movement of trains, further than your duties as station agent?

A. Under the supervision of the operating official, yes, sir.

Q. Have you had any experience that would enable you to judge of the relative expense of operating a through and a local train?

A. Every day experience, yes, sir.

Q. What is the experience that would enable you to pass upon the relative expense of operating those?

A. Every day experience with the M. K. & T.

Q. You mean as station agent?

A. Whatever you are pleased to call it, yes, sir; my every day observation in the service of the M. K. & T., and since my service with the Corporation Commission, riding freight trains, and riding on passenger trains, for the purpose of discovering the truth.

Q. What experience have you had—the experience you have had is of that kind, not as one who was charged with the movement of trains?

A. No, sir, not in direct charge—in moving trains, in
2737 what respect do you mean?

Q. In moving trains along on the tracks of the railroad?

A. I have had direct charge of switching and movement of trains at Cleveland; there is where we handled from forty to fifty cars per day. I gave the directions to the conductor.

Q. In what way did you have charge of that?

A. I had complete charge of his train while at that station.

Q. Tell me what your direct*ion* connection with switching service was?

A. At Cleveland, Okla.,—to go into details, we handled, during the boom, the oil excitement, from twenty to sixty carloads per day, and the team track and side track facilities at the beginning was limited, and it was under the direction of the superintendent of the line,—he gave me authority to take care of that yard, to see that there was no blockade there. Our division terminal point was across the river two miles away, and it was my business to take charge of local trains, of the local train crew, to direct switching operatings and the placing of cars, and to prevent a blockade in the yards from the division terminal point, and duties of that kind at a place where business was extraordinary.

Q. That was the extent of your duties in connection with switching service?

A. It gave me every day observation of local and through trains.

Q. Just the same observation of any other man working
2738 around the station, he could see what was going on?

A. It would all depend upon the man.

Q. Of course, but your opportunity was the same as any other man working at the station?

A. Any other man working at the station did not have the opportunity to direct the operation of the trains.

Q. Did that experience qualify you to form an opinion, which you think would be well founded, as that of an actual operating

man and superintendent of the operations of a railroad, or someone directly connected with the movements of trains, as to the relative costs of locomotive supplies, fuel, etc., as between local and through trains?

A. You are confining your question to locomotive supplies, and what other proposition?

Q. That is the proposition, whether your experience as station agent at Cleveland qualified you to form a judgment that would be well founded, on the basis of your own experience as an actual operating man, as to the proper division of the expense of locomotive supplies, as between through and local trains?

A. No, at that time I had no reason to give any thought to locomotive supplies, but since that time, as an accounting proposition, I have given it much thought and study.

Q. I am not asking these questions for an idle purpose, what I am trying to get at is to ascertain to what extent the experience you have had with railroad operation would qualify you to form a judgment, and what the value of that judgment would be
2739 as compared with other men that have been directly connected with it?

A. You are confining your comparison to locomotive supplies, are you? If you will confine your questions to the real operation of local and through trains——

Q. Can you answer the question?

A. You are confining yourself specifically to locomotive supplies; I had no reason to investigat*ion* locomotive supplies at that time, but since I have.

Q. Did your duties qualify you specially to form a judgment as to the basis of dividing expenses of maintenance of freight cars as between local service and through service?

A. The maintenance of freight cars can be actually located to the car; there is no reason for having any division between local and through trains; one car could be in a through train one day and in a local train the next day.

Q. How have you divided it in your formula?

A. Divided what?

Q. The expense of maintenance of freight cars?

A. Between what?

Q. Between through and local service?

A. On the basis of straight car mile basis.

Q. I thought you stated it could be actually located?

A. You confined it to the particular car itself?

Q. No, I asked you—what I asked you is this, I asked you if you were familiar with subject so as to qualify you to form a judgment as to the proper basis of dividing the cost of maintenance of
2740 freight cars, as between local and through service?

A. I think I am qualified to do that, yes, sir.

Q. What experience have you had that would qualify you to do that?

A. The experience I have related, and the constant thought I have given to these matters, and the testimony I have heard in cases

I have heard tried before the Corporation Commission of the State of Oklahoma, and the testimony of every prominent railroad man in cases heard before the Corporation Commission of the State of Oklahoma, and from conversations and inquiries made to operating officials in the railroad service.

Q. What is the experience that you have had to qualify you to do that?

A. I have related my experience.

Q. The experience that you rely upon for your qualification, is that which you have already stated?

A. Yes, sir, and every day observation of the movement of trains.

Q. I want to call your attention now to some of these matters; I understood in your examination in chief, that you stated that the value of property of a railroad should be divided upon the ratio of the expense?

A. On the ratio of the cost of doing business, yes, sir.

Q. On what theory—on what ground do you base that view?

A. On many.

Q. Will you state them please?

2741 A. It is the best bases and most equitable bases that I know of, and the revenue basis which has been submitted by some accounting officials, is erroneous, and the cost of doing business ought to be and is, in my judgment, the best basis, for the reason that it is more rigid, and not elastic like the revenue basis; the revenue basis would probably cause the value of property to be changed by ups and downs or the increase or decrease of rates, and Judge Vandeventer used it in his opinion written with reference to the temporary injunction granted in this case——

Q. Any other reasons upon which you base that? What has been your observation of the method that obtains in the ascertaining of the value of other classes of property, other than railroad property?

A. We have had no occasion to make any division of the value of property within the confines of the state; we have attempted to get the actual cost of property within the state in order to get the value.

Q. Do you know of any class of property other than railway property, used for industrial or manufacturing purposes, for the purpose of producing revenue, upon which the value is ascertained on the basis of what it costs to operate it?

A. At this time, I cannot call to mind any, no, sir.

Q. If you were going to buy a manufacturing plant today, and you wanted to get at it for the purpose of determining what you would offer for it, would the matter of primary consideration

2742 be to you—would it not be rather the revenue that accrued from its operation, rather than the cost of operating, except as that cost might be one of the factors that entered into the results of its operations?

A. In its entirety it would be; the earning power of the plant would be a factor, yes, sir.

Q. What body of officials assess railroad property in Oklahoma?

A. The Board of Equalization.

Q. Do you know whether they assess it on the basis of the cost of operating the roads?

A. A basis of that kind is not necessary, because they assess it in the entirety; an assessment is based upon the cost or upon the expenditures made for the property; it is carried on the balance sheet; the costs of construction and replacement value are all taken into consideration and the stock and bond issue is taken into consideration; they use various bases.

Q. You say your commission deals with public utility corporations in Oklahoma. Have you any water or gas companies out there?

A. Yes, sir.

Q. Do you know how the values of property are arrived at?

A. We don't make those.

Q. You come in contact with them,—in ascertaining the values of an industry of that sort, isn't it done upon the basis of their revenues?

A. No, the cost of property is primarily taken into consideration.

2743 Q. Isn't the earning capacity a very important factor?

A. I don't think they give any consideration at all to the earning; the principal consideration is the capitalization, and the actual cost of the property, disclosed by their books.

Q. If property that costs a hundred thousand dollars,—we will take two propositions, each cost one hundred thousand dollars; one is earning 10% on the cost, and the other is losing 5% on the cost; what effect would those revenues have upon the value of those properties?

A. It depends on how economically those two properties are managed.

Q. We will assume that they are managed equally as well.

A. Same kind, same class of business?

Q. Yes, sir.

A. Same value?

Q. I won't say that; we are trying to find out the value?

A. The same cost?

Q. Yes, sir, one is losing money and the other making it?

A. There would be something wrong with the direction of the property.

Q. What would be the effect upon the value of the property, would the one that makes a profit and the other which makes a loss, be equal in value.

A. As a business proposition, it might have some effect in the price you or I would be willing to pay for the property.

Q. Wouldn't it be the dominant and controlling factor in determining the value of the property commercially?

A. The profits derived from it in business would have

2744 something to do with the value of the property.

Q. Do you not know, if you desired to determine the value

of the property, wouldn't you determine it on the basis of the revenues?

A. As an entirety?

Q. Yes?

A. The revenue would have something to do with the earning power of the property as a whole.

Q. It is a factor out of which the earning power grows; there cannot be any earnings unless there is revenues?

A. Profits are a great factor in all properties.

Q. I am speaking about the revenues; the gross revenues, you can't determine what the profit is, without taking into consideration first its gross revenue.

A. In all cases you have to take into consideration the revenues in order to find your profits, but that would not have anything to do with the value of the property, the revenues alone.

Q. There are a few leading matters I want to call your attention to, without an argument about them, and I want to see what your understanding is in regard to them; first, the productive power of property engaged in an industrial pursuit, is the most important factor in the determination of the value of the property, is it, or is it not?

A. Of course, the profits or losses have something to do with it.

Q. The most important factor in determining what profits are made is the gross revenues that accrue from the operation of the industry?

2745 A. That is one of many factors.

Q. That is the all important factor, isn't it?

A. No, sir, the prudent and economical management would be taken into consideration.

Q. I am going to assume the most prudent and economical management you can think of; in every case that I put that is assumed; in property that you want to ascertain the value of, isn't the first thing to be considered the gross revenue that can be produced?

A. I don't attach any importance to the gross revenue of that kind; if it was prudently and economically managed, as you say, I would make a rigid examination of the books and records to find if they paid more than the property was worth, what it cost, what it could be replaced for,—the revenues in themselves, would not be a very important matter provided there was an opportunity to make greater profits by some changes in property, or by the installation of new devices or changes in the management.

Q. I have excluded things of that sort, by assuming that the property is well managed. The point I want to get at is this, if revenues are not the basis commercially speaking, upon which the value of property of that character is based very largely, in connection of course with the cost of the property, or what it might cost to replace it in its condition——

A. I don't understand why you persistently use the word "revenue;" I have said that profits and losses have something to do with it.

2746 Q. I want to ascertain the importance of the total revenues as one of the elements in arriving at the value of property in the instance I am giving you now?

A. Revenues as a whole should be given some consideration.

Q. Do you regard them as an important factor or not?

A. In my business, whether it be public utility or mercantile business, the earning power of property must be given consideration.

Q. How do you ascertain that?

A. From the receipts, from the revenues and the expenses, and the resulting profits or losses.

Q. We are getting down now to business; if you want to ascertain the earning capacity of an industry, you first take its gross or total revenues?

A. It wouldn't be necessary to first give that consideration, no, sir.

Q. You have to take that?

A. That would be one of the factors in arriving at the profits or losses.

Q. The other factor would be the expense of operating?

A. It would.

Q. And the difference would be the profit or loss?

A. Yes, sir.

Q. In as much as the revenue is the basis of ascertaining the value of property, in so far as the value depends upon its productive power, and the expense of production is also another factor but the leading or controlling element or factor in determining

2747 whether the property has producing capacity that gives it value, is the revenue that the output will produce—I will ask you, isn't the revenue, the earnings, a better representative of the value of property than the expense of operation, if you have to take one or the other as a represemative of value of the property, would you not consider that the revenue would be the more logical than the gross expense of operating it?

A. No, I would not.

Q. You do not think so?

A. No, sir, I want to explain that answer.

Q. I would like for you to do it.

A. When I said that I would not, I had in mind the division, the different parts of the property on the basis of revenue, as are used in these rate cases, the property as a whole itself, the revenue would be given some consideration of course, and the resulting profits and losses, but confining my answer to these particular rate cases, and the division of property between state and interstate business, the revenue basis for either division of expense or for the division of property is all bosh, it is an absurdity, it is humbuggery; I have worked it out in all its different phases or branches; and it always results in giving one class of business unreal profits, and charging up property to a certain class of business, the values of certain classes of property which is unreal, which can be analyzed and discovered from analyzing the statistics and the accounts; it is

a very nice theory, but when you apply it to the existing
2748 conditions, you find that it is an imposition under a seemingly fair pretence.

Q. What do you think about expense as a fair basis of ascertaining the value, the cost of operation as a fair basis of ascertaining the value?

A. I believe that it is more equitable than any other basis that has been submitted.

Q. You stated in your examination that freight rates are made by the travelling freight agent or contracting agents or persons of that kind, intending, I suppose, to convey the idea that it is done by subordinary officials, what do you base that statement on?

A. Actual experience—everyday experience.

Q. Give me some instance now?

A. Freight rates are largely made on tradition and not on condition; commercial conditions and competition are taken into consideration; from my observation and from my experience, the travelling freight agent is employed for the purpose of contracting business and feeling the pulse of the business interests adjacent to the line of road or in his territory. If he finds that the standard rates will not move the stuff, he recognizes that there is a great amount of tonnage at a certain place which will move providing that rate was made reasonable or right, or would not be prohibitive,—it is recognized that rates have frequently been made that are lower than
the standard rates, and I have heard a great many prominent
2749 traffic men testify, some of the best in the United States, and I have cross-examined them and have repeatedly asked them if rates were made on the cost of service, and I never heard one of them——

Q. You are going outside of my question?

A. I never heard one of them reply that the cost of service had anything to do with regulating them.

Q. The question I asked you was this, to point out to me the instances which you have known of, where freight rates were made by these subordinate agents you have mentioned?

A. From my own knowledge, at the time I was located at Cleveland, Okla., in the service of the Katy, the standard rate as I recall it, for logs and rig timbers for oil wells from Cleveland to Tulsa, and Cleveland to Bartlesville, was somewhere around ten or eleven cents; there were many rigs torn down in the Cleveland field, and I was asked the rate to those points; the shippers indicated that the rates were prohibitive, that they could not move the old stuff into this new territory at those rates, and I took up the matter *up* with our commercial agent, and told him if the rate was reduced to four or five cents, the stuff would move, and he took it up with his superior at St. Louis, and the rate was recommended and billing order was issued.

Q. Who was that commercial agent's superior at St. Louis?

A. The general freight agent.

Q. So you have got it away from the assistant up to the general—

do you know who he consulted before he gave you that special rate?

2750 A. The rates primarily indicate—I don't mean that rate was made by the traffic man or traffic men, but they primarily recommend the making of the rates; they knew the territory and reported to the superior officers—the cost of service had nothing to do with making such rates.

Q. If I understand the instance you have given was an exceptional one for the purpose of moving certain specific and specified articles?

A. While in the service of the Wabash and Pennsylvania I have known contracting men to make over night rates, and right along, special rate orders would be issued.

Q. I asked you for an instance and you gave me one in your experience; I am confining my question to that, and asking you if the condition out of which that special rate was promulgated in the general offices of the Company at St. Louis, upon the recommendation of the commercial agent and yourself, if that wasn't an exceptional and especial condition that existed down there? Confine yourself to that instance?

A. It was the result of one of a good many special conditions.

Q. What are the others of many?

A. Well, in the establishment now of the brick plant at that place, I was connected with the commercial club at that point, and we had plenty of shale located there, but the prospective builders of brick plants indicated that it was a one line town "we can't do business at a one line town, there is no railroad competition here,

2751 while your shale is good, and your inducements in other respects are good, we might be held up on account of there being only one railroad, by prohibitive freight rates." In connection with the commercial club, I recommended that the standard rate from that point to other points throughout the state be materi*ally* reduced—I took the matter up with the commerical agent, and as a result, the brick plant was built there, and the rates were given very much reduced.

Q. You wanted to build up an industry there?

A. Yes.

Q. You made the suggestion to the commercial agent?

A. Yes.

Q. Do you know who he went to?

A. To his traffic superior.

Q. It came up to headquarters, and they are finally passed upon?

A. Yes, sir.

Q. To get back to my question, I asked you if there was not an especial condition existing at that place out of which the concession was made as to the rate on timbers, of which you spoke in the first instance? That was an exceptional instance, wasn't it?

A. It might be——

Q. It was a rate made for the purpose of transferring certain material that had ceased to be needed at one place to another place, and they couldn't afford to do it under the general rates, and they,

made an application for a special rate that would enable them to move the stuff from one place to another?

2752 A. That wasn't my motive, and I don't think that was the actual motive.

Q. I am asking you if that wasn't the actual facts?

A. It was to get business, to get tonnage, to move, to get some revenue.

Q. It grew out of those special conditions, and if that concession had not been granted, the material would not have moved, would it?

A. It might have been teamed over; it would not have been moved on our line of railway.

Q. In making a special rate on material for brick, that was to get an industry started up there, that was the purpose for that?

A. One of the purposes, yes, sir.

Q. Do you know whether the traffic officials who acted on the recommendation made by the commercial agent, acted in total disregard of what it would cost to move that, or do you know whether they considered it or talked it over among themselves—I am speaking about your information?

A. The prime object was to get business?

Q. I am asking you if you know the methods that actuated those men, and do you know whether they, in determining that question, in their conference if they had any conference among themselves, or if one man did it, that they acted without regard to the cost of service and that was not involved in their consideration?

A. I believe he did.

Q. That is your opinion, do you state it so you can swear

2753 to it?

A. I will state it this way; it occurred to me this way: as it would to any sane man; if the old rate which was reduced about one-half was made upon the cost of service, the new rate must be made less than the cost of service, and if the new rate was made upon the cost of service, the old rate must be unreasonable.

Q. That is a process of deduction upon your part?

A. I have asked the question repeatedly of prominent traffic men, and they have never yet stated that they made rates upon the cost of service.

Q. Have you read any of the testimony in this case?

A. I have read some of the testimony of Mr. Doddridge and Mr. McPherson.

Q. Did you read the testimony of Mr. Watson, who is one of the traffic men of the Cotton Belt Railroad?

A. No, sir.

Q. Did you read the testimony of Mr. Perkins, who is General Freight Agent of the Iron Mountain Railroad?

A. No, sir, I have heard the testimony of every prominent traffic man——

Q. To go a little further into the instance you have mentioned, did the changes in rate go any further than to accommodate special conditions that existed there, or was there any general change in

rates applicable to the haul of the kind of material that was involved in those two instances you have mentioned.

A. It applied a much lower rate between Cleveland and the
2754 final destination.

Q. In the first place, as to the hauling of those particular logs, and the manufactured product of brick——

A. They were factors that were taken into consideration.

Q. Don't you know as a matter of fact, that railroads, like all other industrial concerns, have to make exceptional rates and regulations frequently, to meet exceptional conditions, that when they do *they,* they are not changing the prices which they charge in their general operation, don't you know that?

A. What prices do you refer to?

Q. Don't you know that fact, that railroads, under such conditions as you have described, in two instances you have referred to, might well make an exception on account of the special conditions, and still not abandon a rule that it might have to so graduate its rates so that the business could be conducted at a reasonable profit.

A. Such exceptions were repeatedly made, and were of almost daily occurrence, and the same exceptions were made for other conditions, and from my own knowledge in the City of Chicago, I know those exceptions were made daily, almost daily; we received special billing orders for billing of certain commodities almost every day.

Q. Their frequency grows out of the large volume of business and immense number of transactions that grows out of the conduct of the business of the railroad?

A. It only illustrates and illuminates the fact that rates are not based on cost of service.

(Question read by request of plaintiff's attorney.)

2755 A. That follows, yes, sir.

Q. A railroad 25 miles long would not have so many occurrences of that sort as one 2500 miles long, would it?

A. I wouldn't think so.

Q. That rather illustrates the effect of a large volume of business and of the ramifications of business in bringing about these special instances?

A. Competition would be taken into consideration and commercial conditions.

Q. You stated on your examination in chief, that the Railroad Commission of Oklahoma, I think, made complaint about a lumber rate from the Louisiana and Texas lumber zone to Oklahoma. I wish you would explain to me what that complaint was, and what was done with it?

A. The attorney general of our state, after an examination of the tariffs and the rates applicable to lumber traffic moving from Texas and Louisiana points, through the State of Oklahoma to points of destination in Kansas, Iowa and Nebraska, and other states north, came to the conclusion that there was a discrimination against Oklahoma in that lumber moving from Texas and Louisiana producing points to points distant two and three hundred miles in

Oklahoma at a rate of 23 cents per hundred pounds, and that such lumber also moved from the same points of origin to destinations in Kansas, Missouri and Nebraska, at the same rate, a distance of six to nine hundred miles, he came to the conclusion that there was a discrimination against Oklahoma in that lumber was
2756 carried from such producing points to points in other states, where the distance was three times as great, for the same rate of charge.

Q. What was done about it?

A. I am going to give you a history of the case. He suggested that we make a graphic illustration of this.

Q. You mean the Attorney General?

A. Yes, sir; and we prepared a map showing in colors how this rate worked.

It seems that there have been some provisions in the charter of the railroads, the Choctaw, Rock Island and Santa Fe, granted them by Congress, that the rates in Oklahoma should not be higher than the rates charged for similar traffic in Kansas and Arkansas.

He took the matter up with the railroad executive officials and the railroad executive officials suggested that they have a conference at Kansas City to see if they could not come to an agreement of some kind to equalize these rates, the Interstate rates into Oklahoma.

The Attorney General presented the matter to the railroad traffic officials and executive men; the latter seemed to be surprised, from what the Attorney General tells me, that such conditions ex-
2757 isted. They were not familiar with it and they came to the conclusion that their traffic men were discriminating against Oklahoma in the readjustment made of rates.

That was a very graphic illustration of the fact that rates are not made on the cost of service.

Q. What changes were made in rates——

A. The reduction of two or three cents a hundred pounds, in rates to Oklahoma points. In some instances more, I think.

Q. They were complaining that the rate being charged was too high, were they?

A. Well, that fact and discrimination and other things, generally. They wanted to present the matter to the railroad executive officials to see if they could not make a readjustment.

Q. I suppose if a readjustment was made that would be conceding that the rates were too high?

A. I do not know what they had in mind.

Q. What did the Attorney General and the people complaining about it have in mind?

A. We used it to illustrate graphically in our rate cases that the rates are not made on the cost of service. We used it for that purpose in our rate cases.

Q. Complaints were not made for that purpose, were they? The purpose was to get relief, was it not?

A. We wanted the readjustment of the rates.

Q. That was not in the interest of principle, but it was to
2758 save money to your shippers, was it not?

A. I got it indelibly impressed on my mind from the point I have stated——

Q. I am trying to get you to distinguish between impressions on your mind and the facts in the case:

What I want to know is what was the complaint? Did your people feel they were being charged too much on grain shipped from Texas to Louisiana?

A. That was lumber.

Q. Lumber, I mean.

A. Oh, yes, we felt the rate was high.

Q. The trouble about that was in the adjustment of the rates in that zone that extended from Oklahoma North into Kansas?

A. Up into Nebraska.

Q. Which you testified in your examination in chief was seven or eight hundred miles across, did you not?

A. Approximately that; whatever the distance is. Of course the distance can be secured from the Official Guide.

Q. Now, the logic of that was that the rates under that adjustment—assuming that the zone was from five to eight hundred miles in length and they charged the same rate on the near side as on the far side from the point from which the shipment originated—is that they were charging too much in your country and too little
2759 up on the Northern borders; was not that about the logic of it?

A. We supposed they were making rates to secure profits out of their business; that would naturally follow. The point was particularly that the complaint was, "Why are you charging twenty three cents a hundred to Omaha from Texas producing points and charging the same rates to our border at the Red River?" It was put up to them in that way. We wanted the traffic men and executive officials to answer the question.

Q. The point I want to call your attention to is this: if a blanket rate of weight to a zone which covers a large territory is unreasonable it is because the rate is discriminatory is it not, growing out of the fact that it would perhaps be too high on one side and too low on the other, with reference to the length of haul and interest of the shippers? Is not that the real basis of your objection on the ground of discrimination?

A. That would be a good way to put it.

Q. Now, putting it that way, so far as the question of relation between the cost of service and the amount paid for the service is concerned, it would equalize itself: if they got too much for this side of the zone and too little for the other side, the probabilities are that when you got to the middle it would be just about fair.

A. That would not follow, because there are intermediate
2760 lines hauling that would participate in the haul.

You want to equalize the cost of service. They say, if a rate is twenty three cents at a point three hundred miles away and

twenty three cents at a point one thousand miles, there must be a happy medium——

Q. They must find a happy hunting ground?

A. That cannot follow in all cases because there are other lines participating in that haul; there may be a half dozen lines participating in the haul; and interchange of the cars at junction points; rebilling and weighing in transit; all those things must be taken into consideration, and it might follow if the haul was entirely upon one line of railroad that the case might equalize itself, but such is not always the fact, and in the great majority of instances the real conditions are that there are probably four, five or six carriers involved in the haul.

Mr. HILL: Then there are discords even in the happy hunting ground?

A. Yes, sir.

Mr. MOORE:

Q. If twenty three cents is a reasonable rate on lumber from Monroe, La., to Independence, Kans.—which I understand is an intermediate point in that lumber zone for the transportation of the freight—would the fact that two roads instead of one participate in the haul render it an unreasonable rate?

A. You mean the fact in itself that two roads participate in the haul?

2761 Q. Yes.

A. Oh, that fact alone would have nothing to do with it in particular; that fact alone.

Q. If commercial and competitive conditions are such as to create a necessity for establishing zones of that kind you refer to, for the shipping of a product, we will say lumber, to establish a blanket rate applicable to the zone; if the railroads in order to meet that condition should prescribe a rate that was too high with reference to the cost of the service at one point than at another point in the zone—in other words, a rate which the shippers on the farther side of the zone might be satisfied with and feel they were getting a low, cheap rate, but which would dissatisfy the shippers on the other, the nearer side, and cause complaint of discrimination because the rate there was higher than it should be with reference to the cost of service; while it might result in some inequality or injustice as among the patrons of a railroad, the shippers, does it impair or destroy the principle that the rate is fixed with reference to the cost of service, taking it as a whole and in its totality and applying it to the entire territory covered by the zone, assuming it might be an injustice on one side and might be more liberal than it should be on the other?

A. On that particular commodity?

Q. Yes.

A. Yes, because it would be impossible for the traffic men

2762 or any other human being in the first place to find the cost of service on that particular commodity.

Q. That comes back to the question of whether it can be done;

what I am trying to discuss with you is whether there is an attempt to do it. Your testimony is that they do not seek to do it. I am speaking with reference to that, whether they can do it, not whether it is practicable.

A. No, I do not believe they give any consideration whatever as to the cost of service. What they want is to get the business and produce the revenue.

Q. How can you produce revenue unless you adjust your rates with reference to the cost involved in its production?

A. If you really haul a commodity for one half the cost of service, you are producing some revenue, you are paying part of the expense; you might be paying transportation expense and maintenance, and you might not pay the pro-rata of the interest and fixed charges; all those things enter into the matter.

Q. Speaking of paying transportation and maintenance expenses—you are assuming that train would run empty if there were not a load of lumber to take up from Louisiana?

A. I am basing my conclusions from my own knowledge and upon the testimony of prominent men—some of the most prominent railroad men in the United States—basing it upon testimony from Mr. Kruttschnitt; Mr. Lincoln, formerly with the Missouri Pacific-Iron Mountain—I think he was the head of the Traffic Depart-
2763 ment; Mr. Hill of the Great Northern, and Mr. Fish, formerly of the Illinois Central, in their testimony given before the Senate Committee, at the time the Hepburn Bill was up; and on the testimony of many prominent railway officials in cases heard before our Commission.

The point that is always prime among those traffic men is to get the business, have a return haul—anything to get the business.

Q. So your testimony, then, as based on what you have read in the statements of others?

A. What I have read and heard, and what I have observed.

Q. Not upon any knowledge you have?

A. Yes, it is based on my own knowledge, part of it.

Q. You spoke about a return mileage on commodities: is not that a factor that would enter into the consideration of the cost of service, whether by giving a low rate and using it you could get a return haul?

A. The return haul is given a great deal of consideration.

Q. And it has a great bearing on the question as to whether a railroad company is earning more or less than the cost of service in transporting a certain article?

A. It has a bearing on the revenues as a whole, but has nothing whatever to do with the cost of service.

Q. If a railroad could establish a rate that would enable it to
2764 haul a large volume of lumber from points in Louisiana to East St. Louis and there load the cars with coal to go back in the opposite direction, would it not be justified as a business proposition and upon consideration of all the elements that are usually considered by men in any given business transactions, and among

others, the profit that could be made out of it in making a low rate for the purpose of bringing about a condition of that sort?

A. Naturally, an up-to-date traffic man would want to get a return haul in his empties and if he saw the tonnage in sight, if there was no restriction, he would be tempted to make a very low rate to load those empties for the return movement. At the same time, he would not give the cost of service any great consideration. It would occur to him, likely, "well, it is putting some revenue into the coffers of the Company and something will come out in the wash at the end of the year" and that is about the result?

Q. You said that getting a return loading was an inducement: why is that so? Why does a railroad official make a low rate on the business going in one direction because they can get a loading in the opposite direction on return cars?

A. To produce revenue, to get the money.

Q. Is it not because, while the rate may be low and the profit may be very small on hauling the lumber North, when you get the return loading of coal going South, in the case I put, that

2765 taking the two together it would be a profitable business?

A. A very low rate on the return movement.

Q. Whatever the rate may be—what I mean is this: if the railroads on the consideration that you speak of, namely, in order to get a return haul, will make a very low rate, is it not because taking the two directions together, the going and the coming, they can make money out of it?

A. They take it under the impression that something will come out in the wash at the end of the year and they will have something to show for their efforts.

Q. You do not mean to say, do you, that railroad men seek business on any other basis than the purpose of making money for the Company?

A. At least they believe they are doing some good for the Company. I think they honestly believe they are, but I do not think they know anything about the cost of service, and I do not think they give that any consideration. I am sure they do not from my personal knowledge and from their testimony.

Q. Would you not think railroad earnings would be a very uncertain quantity if the cost of the service was totally lost sight of in fixing rates? How else can they make dividends?

A. On some lines they have an index to the cost of service. For instance, on the Hill and Harriman lines it is an axiom to watch the cost per ton per mile.

2766 Some traffic men, for instance on the Pennsylvania and Wabash Railroads, they receive an average of the cost per ton per mile.

On the Pennsylvania road, in recent years, the average expense per ton per mile has been less than five mills.

Q. You say average expense?

A. Yes, it has been much less than five mills. Now, that is an average; it is an average for all; it is an average for silks and coal moving in the same train. It is an average for iron ore and for

perishable goods; an average for first class and for lettered classes, the low classes; commodity rates.

He has an average there. It might occur to him that, if I make a rate less than five mills per ton per mile I am taking it at a loss to my company. I believe that some traffic men, from the testimony they have given, use that as an index to cost, the average cost per ton per mile, and that is sort of a guide for them.

Q. What is the purpose of that? Why do they want that if they do not care anything about the relation?

A. In the actual order of railroading the cost is worked out on that principle, in getting an average cost per ton per mile.

2767 Q. So it does come back, in the end, that there is in the minds, even of railroad traffic officials, a consideration for the relation between cost of service and the compensation for it; that is true, is it not?

A. Yes, they have some idea; but in the actual making of the rates they do not always take that index they have there into consideration. It occurs to them sometimes, well, here is some business offered; do we want it; had we better let it move over our rails; the other fellow might get it, and I will take it.

Q. Now, Mr. Willmering, let me ask you right there: say one of those roads that you refer to ascertain from its statistics that the average cost per ton mile is five mills; do you believe that the officials of that railroad, having gone to the trouble to ascertain that fact, would haul a train load of the most fragile and at the same time the most valuable commodities that are known to the railroad traffic, at the same rate per ton that they would the least valuable, and the heaviest and least liable to damage or injury—commodities, I mean of that class? Do you believe that any railroad official would do that?

A. Haul a high class commodity at the same rate as a low class commodity?

Q. Yes.

A. I believe there are instances where they have done that and I believe you will find exceptions to the classifications——

2768 Q. I am not speaking of exceptions. Every rule has an exception. Among lawyers and judges it is said that the exception proves the rule.

What railroad officials conduct their business in that way? Do you know any case in which, as a rule of practice, a car load of glass, fine Bohemian glassware of the highest value and most liable to breakage (if I am correct in that) would be hauled at the same rate that a car load of brick, stone or lumber?

A. The traffic man would be governed by traditions, by the rules that were handed down to him by his predecessor, and the classifications that were made in the beginning.

Q. Well, let us go back to the predecessor; would he have disregarded those conditions?

A. There is a beginning to all things, and in the beginning the commodities were classified in the Official and Western Classifications, and at the time those classifications were made and built by these railroad traffic men—the cost of railroading—in the beginning

the cost per ton per mile was very great. For instance, on the Pennsylvania road from 1864 to 1870, it was probably fifteen mills; today it is five mills.

2769 At the time that this classification was made it may have been submitted and agreed upon in the seventies when the average cost was high and it is handed down from time to time, and it still remains in the classification at the old rating. Of course, the traffic men then are governed by the old traditions instead of the cost of service.

Q. What is the object of the classifications made by this Western Classification Committee and other bodies engaged in that kind of work?

A. Well, there are a great many new things manufactured that have not been classified and they get together and agree upon a classification of some new thing; and oftentimes complaints are made about erroneous classification, or high classification, and those complaints are made by the shippers in their meetings at the conferences.

Often it occurs to them, now we have to get more revenue, we might raise a few of these things to a higher class. Instead of raising the rate they raise the classification. All those things are taken into consideration.

Q. My question was what is the object of classifying commodities as done by those Committees.

A. The object is to prescribe rules and regulations for the government of their employees, principally, and to submit it in a way that they can——

2770 Q. Is it not the object, just as the name implies, to classify freights that are transported by a railroad with reference to the application of the rates that are made by the companies after the classification is made?

Mr. HULL: Had you finished your answer?

A. No. Consideration is given to the casualty risk in different commodities; some commodities may be rated higher than low grade stuff that ordinarily move. All those things are taken into consideration at the conferences. They make corrections and amendments to the classification.

(Previous question read.)

That is the prime object, to classify the quantities, the things moved.

Mr. MOORE:

Q. What are the general rules governing these classification committees in making that classification?

A. What are the prime motives governing them?

Q. No, by what rule are they governed in making that classification as between different articles of freight?

A. Oh, bulk and the casualty risk, the lading, space occupied by the commodities; these are given consideration.

Q. Why do they consider those things? Why do they give consideration to those elements?

A. I am not a mind reader. I could not tell you that. They are governed by opinions and their own theories.

I have seen so many conferences of these men when they get together and they are about as bad as insurgents and straight Republicans in Congress. They cannot agree among themselves. They have some suggestions to make; they get all mixed up and finally the ideas are adopted.

2771 Q. You doubt the wisdom of their methods sometimes?

A. I doubt the wisdom of their theory, because I have disproved it.

Q. I believe there is a first class, is there not?

Mr. HILL: I suppose Mr. Willmering is your witness on all these propositions?

Mr. MOORE: No, I am cross-examining him on things growing out of what you brought out, whether there are any relation between the cost and the pay for the service rendered.

Mr. HILL: We did not go into classifications at all.

Mr. MOORE: I know, but it has a bearing on it.

Q. I was asking Mr. Willmering how many classes there are of the Western Classification Committee.

A. Five hundred classes, one to five——

Q. That is sufficient for my purpose.

A. The lettered classes are from A. to E.

Q. What are the characteristics of that which is included in the first class, with reference to the cost and risk of transportation?

A. Well, the value is given consideration, and in case of loss and damage, the liability for loss and damage. It would be a hard matter to state what factors enter into the matter, because of the traditions governing and the making of exceptions.

As I stated before, these men do not agree among them-
2772 selves—the traffic men—as to how some new thing should be classified, some new invention, or some new thing manufactured. Sometimes the question of policy enters into the matter. The question of policy in this respect: here is a new industry established. If we class that as third we might not get the business. It may be they could not afford to manufacture and move the stuff.

If we classify it as fourth we might get some business from it. Things of that kind all enter into it—commercial conditions govern, competitive conditions, all those things are taken into consideration.

Q. When those exceptional conditions arise, they depart from the general rule, do they?

A. Those are not exceptional conditions. The traffic men meet those conditions every day.

Q. Mr. Willmering, are not weight, bulk and value, primary considerations in the making of classifications and is not that obvious to any one who will take the classifications and look at them?

A. That is one of the many primary——

Q. That is obvious on the face of the classification is it not?

A. It is built on that theory to a great extent, but it does not always follow that he conditions follow the theory. Other matters are taken into consideration.

Q. Are those not elements that enter into and very largely
2773 influence the cost of handling the transportation?

A. I will never believe that the cost of handling has anything to do with rate making, because I never discovered it.

Q. I asked you if as a factor—not what any man's notion may be—weight, bulk and value do not affect the cost to a railroad company of transporting goods?

A. Those are numbered among some of the many factors that enter into it.

Q. You spoke of the Pennsylvania Railroad and the Hill Railroad collecting statistics for the purpose of ascertaining the average cost per ton mile for transporting freights and getting out an index of that:

Does that index also show the average length of haul?

A. The average length of haul is sometimes worked out, but I think it is very rarely given any consideration by the traffic men; it may be in some cases.

Q. The question I asked you is, if the index they prepared does not also show the average length of haul of all the freights that bring about the average cost of five mills, or any other average that may be ascertained.

A. The particular exhibits I have seen of the Pennsylvania Company, and the Wabash Company, in the exhibits showing cost
2774 per ton per mile, the revenue per ton per mile, and profits or loss per ton per mile, have not shown the average haul, and where the average haul is shown in such compilation it is the average haul for all business. It is intrastate and interstate, car load and less than car load, all thrown into one, and the average is taken from that. Of course that in itself—I have heard traffic men say they have given the average haul theory some consideration, but I have never heard them explain comprehensively why they have given it any great consideration.

Q. I will ask you further if those indexes which you have in mind do not show the average haul of various commodities, not the general average of all, but the various commodities that are classified and shown in that index.

A. No, I do not recall seeing the commodities classified and the average haul given for classified commodities.

Q. We will leave out classified commodities: perhaps the word does not convey the correct idea. You say they classify and they get an average: do they not divide that into commodities and do they not give the average length of haul for commodities?

A. I believe coal is separated, but I think all other commodities are thrown into one whole. I believe, as I recall it now—I am speaking from memory—The Pennsylvania made a separate compilation of coal.

Q. Does the index, kept by the Pennsylvania Company, contain no other of the average haul except such as is applicable to
2775 the coal?

A. I do not know now. I have not seen such a statement.

Q. Does the index show the percentage of empty cars moved under a given expense that is moved by it?

A. The Pennsylvania Co. go into very great detail in working out statistical information and doubtless in regard to the empty movement and loaded movement, both East and West. They give that some consideration for the purpose of showing in which direction the volume of empty movement is.

Q. Is not all that done for the purpose of giving information to those who have charge of the traffic of these roads in regard to the relation between the cost and the revenue that accrues to the Company from its business?

A. It gives a mean. It is the average of all of the stuff that moves, at the end of a given period. While it gives an index as to the average cost—if you have the average cost at five mills—it is left to the conjecture of the traffic men whether the five mills covers the haul of silks and satins, or whether it is for coal. It is up to him to make a good guess and that is all he does.

Q. Do you mean to say when he gets that index he puts the same rate on a car load of silk as on a car load of coal?

A. If he gives special attention to that index that would follow that he would do that. He exercises some judgment with regard to the traditions, the classification that has been prescribed
2776 for him in the past.

Q. Now, Mr. Willmering, I want to ask you this question, and I would like you to understand it fully before you answer:

Is it not true that the purpose of this index which you have described is to establish for the benefit and use of the traffic men, the average relation between the cost of service and the revenue that is produced by it, and do not the traffic men in their application of it to the current business which arises on their road, act with reference to the effect that the characteristics of the freight to be carried—bulk, weight, value, etc., would have in determining the proper application of that average to the particular commodity upon which they fixed the rates?

A. They are governed by the classification of commodities in the Official or the Western, or other clasifications in common use, and, as I stated before, the only real index they attempt to use in the real art of railroading, is the average cost per ton per mile. It has been worked out on the Pennsylvania, since 1864. That gives them an average cost per ton per mile and that is the only unit that they ever use of cost.

Q. That is a starting point in fixing the rates, is it not?

A. It ought to be of some assistance to the traffic men in
2777 making rates, because it has been constantly used for finding a unit for cost of service. It ought to be of assistance, but I do not believe the up-to-date traffic man in railroads, or traffic men that have come under my observation, and from my knowledge while in the service of the Company that any consideration is given to the real cost of service of any particular commodity.

Q. Is not a good deal of expense involved in getting together the statistics that are embodied in that index?

A. Yes, in getting the index, the average cost per ton per mile, each individual way bill—it is compiled from each individual way bill and the real distance between point of origin and point of destination for each particular commodity on that way bill is carried out into ton miles; and the railroad companies have used and compiled those expensive statistics for years and years and it has been the unit for cost, the ton mile. I believe it is a——

Q. Why do they go to all that expense and trouble if they do not use it after they have obtained it?

A. I have wondered about that myself, Mr. Moore. I have wondered why they did not use their own unit to find the cost in these state rate litigations. That is truly remarkable.

Q. How often does the Western Classification Committee revise its classifications?

A. They meet very frequently. I have not kept posted on that.

2778 Q. Don't they do it every six months?

A. It is likely they meet semi-annually.

Q. What is the purpose of making those revisions?

A. To classify new things that are manufactured and to lower or raise classifications and meet new conditions.

Q. The purpose is to revise and adopt the former classifications to existing conditions and circumstances at the time of the revision, is it not?

A. Yes, to commercial conditions and to competition—competitive conditions. Oft times stuff that has been classified to second class may be reduced to fourth class and the factor of bulk and of liability, etc., that consideration, if it entered into the previous classification, is destroyed there if they reduce it from the second to the fourth. It is due to some new condition, competitive, commercial, or some question of policy.

Q. It shows they are getting away from the traditions you have been talking about, does it not?

A. The only way they get away from traditions is to meet competitive and commercial conditions. It is not the cost of service.

Q. For what purpose do they entertain and hear complaints from shippers about classifications?

A. Ordinarily the complaints are described as discrimination.

2779 Q. The complaints are based, are they not, upon the proposition that the classification results in too high a rate upon the commodity that the man who makes the complaint has to ship?

A. It is likely that the men will make a complaint, claiming that the classification makes a prohibitive rate and that they cannot move the stuff on that rate; that they want a lower rate classification.

Q. The rating then depends upon the classification?

A. Excepting commodity rates.

Q. And to the extent that the classification is controlled by the characteristics of the different articles that are embraced in it, such

as weight, bulk, and value, that have been mentioned, those characteristics also affect the rates that are based on that classification?

A. They are numbered among some of the many which affect it.

2780 Q. In what cases did you make an examination of railroad witnesses referred to in the former part of your testimony?

A. In a number of cases before the Corporation Commission of Oklahoma, and in cases remanded by the Supreme Court of Oklahoma for the further taking of testimony before the Corporation Commission of Oklahoma.

Q. Have you been assisting in conducting trials of that character?

A. Yes, sir.

Q. Are you taking an active part in the litigation now in progress between the Oklahoma Corporation Commission and the railroads, in regard to the rates in that state?

A. Lending all the assistance possible, yes, sir.

Q. In looking over the paper you handed me in response to my request, where you prepared a formula showing your method of dividing operating expenses between state and interstate, I notice the first item is "Maintenance of way":

A. That is the first general account, yes, sir.

Q. That you divide on the basis of car miles, straight?

A. Yes, sir, as between local and through trains.

Q. Do you divide that expense as between passenger and freight?

A. Between passenger and freight?

Q. Is that expense divided by the railroads as between passenger and freight?

2781 A. After the expense is divided between passenger and freight, after the actual freight expense has been ascertained.

Q. How are they divided between passenger and freight?

A. On the basis of the revenue train miles, it should be, except Account No. 17 "Docks and Wharves", which would be assigned to freight.

Q. Why do you change the basis of division when you come to divide between local and through freight trains?

A. In the hire of equipment the car mile is used and is a recognized basis. Armour Company and refrigerators are paid on the basis of car miles. It is an established basis and it would be more equitable for the reason that one day it might happen that a local freight train would have the greater number of cars, and the next day it might be that the through freight train would have the greater number of cars. It is a better average than the train mile. It is recognized in railroad accounting as a——

Q. When did you ever know a division of "maintenance of way" expense to be divided between local and through trains in railroad accounting?

A. There would be no necessity for such a division until this litigation occurred between states. There has been no necessity for it. The railroad accounting officials have not given any attention, study

or thought to that division, until these matters came up very recently.

2782 Q. Has there been any system of division practiced by the railroads in their method of keeping accounts, as between local and through freight trains?

A. They are just as deep in the mud as we are in the mire, because they are of recent date, as between state and interstate. But the basis I have suggested here, in my judgment, is a fair basis—an equitable and a just basis, for the reason that the expense of "Maintenance of way" is common to all classes and characters of traffic. It is not caused by any particular class of traffic, and the expense or outgo for "Maintenance of way" is caused by the acts of Providence, acts of God, whether a wash-out, deterioration of ties owing to weather conditions. In all truth and in all logic, the car mile ought to be accepted for the basis of division between local and through.

Q. If that is true, why should it not also be used as a basis of division between passenger and freight trains?

A. Well, we have made a concession to the railroad companies in that respect and have accepted the theory arvanced by the railroad officials themselves.

They were first to advance train mileage for a division between passenger and freight business, and where the charges could not actually be located, in a great many of the instances, between passenger and freight, might be assigned directly to passenger and freight traffic accounts.

2783 One of the principal reasons why we have accepted the revenue train mileage basis for a division between freight and passenger, where the expenses cannot be located, is just a concession to the majority of the accounting officials. It is accepting the railroad's own theory.

Q. Who made that concession? You say "we". Whom do you mean by "we"?

A. I mean we who represent the states in this litigation, especially in Oklahoma.

Q. What is your view about what would be the best basis as between passenger and freight?

A. As between passenger and freight? For the "Maintenance of way"?

Q. Yes?

A. I believe the car mile basis would give us the basis where the degree of accuracy would be greater than the degree of inaccuracy.

Q. Now, Mr. Willmering, in making that statement, don't you go counter to the concensus of opinion and practice, as put in practice and continued by all railroad accounting officials?

A. I would not say all—I believe if it was shown up to the railroad men—railroad accounting officials that now recognize the revenue train mileage basis in so far as "Maintenances of way" is concerned, I believe they would agree that the car mile would be the

2784 more equitable basis, everything considered.

Q. What I am intending to ask is this: what is and has been the practice among railroad accounting officials?

A. The practice has only been applied in the division of freight and passenger expenses; the revenue train mileage, with the exception of on account "Docks and Wharves"—all the charges made to that account is caused by freight traffic.

Q. What part of the expense of "Maintenance of Way" is assignable to the freight and what part to the passenger traffic?

A. It is common to both. It is not assignable to either one, except on an arbitrary basis.

Q. I understand that, but you stated some parts would be assignable——

A. One particular account, "Docks & Wharves". The charges and outgo from that particular account are assignable to the freight, not assignable to passenger, because it is not caused by the passenger traffic—with the exception of that one account under "Maintenance of Way & Equipment".

I don't suppose that the Iron Mountain or any of the roads connected with this case have any "Dock and wharf" territory. I am speaking with reference to the Interstate Commerce classification of "Maintenance of way expense".

Q. What proportion of the expense of "Maintenance of Way"; what part of it is directly attributable to the wear and tear produced by the operation of trains on the tracks, and what part is

2785 attributable to other causes?

A. The part that is attributable to wear and tear of cars or trains would be infinitesimal compared with the entire outgo, but in the maintance of way and structures the elements and the acts of Providence would cause the greater part of the outgo.

Q. Are station buildings included in that term "structures" as used in that connection?

A. Oh, yes.

Q. Fences, telegraph poles, and so on?

A. Yes, sir.

Q. Why should that expense be divided on the basis of the cars used?

A. The road is built for the purpose of moving cars over the rails. That is primarily the purpose.

Q. I can understand why the damage produced by the wear and tear to the rails by the wheels should be made a direct charge and apportioned that way, but I have observed a number of indirect charges, that you have divided them with reference to the earnings, you say?

A. I have made no apportionment of any expense there on the basis of earnings.

Q. I do not say that you did. I mean the state acountants in this case.

A. They merely made a test and followed the theories advanced by the railroad company's experts, and applied figures to the railroad's theories.

2786 Q. How do you know that to be the case?

A. They have attempted to make a test of the theories of Mr. McPherson and Mr. Doddridge and apply it to conditions

existing in Arkansas. They followed their ideas to a great extent and made a test to bring out facts and figures resulting from the theories advanced by Mr. McPherson and Mr. Doddridge. That is the way it appears to me and it occurs to me they made a painstaking effort to put a test to the theories advanced by the railroad experts.

Q. I observe that you make no allowance on account of local service in your division, you divide it straight:

In Exhibit K, filed by Mr. Wharton, he adds 50% to local engine mileage for station switching.

A. Yes, that is an arbitrary allowance and it is favorable to the interstate business. It is following the theory advanced by the railroad experts and it is unfair to the state.

Q. Why?

A. Because it is both, foolishness. The idea of wanting to charge additional maintenance for switching expense to local freight trains. Anyone that has been in the railroad service and observed these things daily would know that it is humbug.

Q. You think there is no more station switching on local than on through?

A. Certainly; but the local trains are doing switching
2787 for the through trains in reality, under existing conditions——

Q. What do you mean?

A. A through train sets out—a carload of interstate freight. That through train don't stop there to spot that car at an industry track, or spot it for unloading or loading a the team rack or the industry located at that station; but the way freight train, which is the workshop of a railroad, it goes along, follows that through train and performs that switching service——

Q. You think an extra charge ought to be made the other way?

A. I believe there ought to be some plan devised where the time employed by the local train crew to that particular character of switching—which ought to be ascertained and could be, for the future; for the past there has been no record kept of it.

Q. In your view it should be charged to the through instead of the local train?

A. The through train should be charged in reality for whatever service was performed by the work train.

It is a misnomer, calling a way freight train a local train and trying to confine it exclusively to freight traffic, which, by inference, a great many railroad experts have tried to either mislead the layman; it is unfair on the part of the railroad experts by inference to assign all this extra cost to a local freight train, and by
2788 inference allow someone to believe—who is not familiar with the real conditions—that this local train performs exclusively service for state business. It is a wrong inference for those railroad experts and it is unfair for them to assume anything of that kind.

Q. There has been something said in this case about what they called the "peddling" business, in connection with the distribution of state freights, and it has been treated as an extra source of expense

which is not attributable to the interstate business? Is there any additional switching connected with that in any way?

A. The peddling business? You mean less-than-carload business?

Q. Yes, and I mean the peddling distribution of state freights: Is there any extra switching involved in that?

A. Yes; it costs more to handle less-than-carload business per ton per mile, than it does to handle carload business.

Q. Where would you assign that extra expense?

A. If the greater number of ton miles was found to be interstate, I would charge it to the interstate business or through trains or whatever class of trains carried it.

If the greater amount of less-than-carload miles was state business, of course it should carry the burden of that extra expense.

Q. Let us suppose that we have a local train starting from Little Rock, going to run 100 miles: it carries some interstate
2789 freight that was switched on to it from the interstate train that came into the station where this shipment originated: It has a number of cars of state freight for distribution along the line; that stuff was brought in Little Rock and taken out in small packages and is to be distributed. It has to stop at all the stations to peddle it out: that is what they mean by "peddling trains".

A. Making delivery of less-than-carload.

Q. Let us asume that the greater part of the delay in the distribution of those freights results from the state freight—while you have interstate freight on there, that has to be delivered at a few—two or three stations; the other has to be distributed among a dozen stations:

Take a case like that and state where the extra expense growing out of switching and other service incident to the distribution or peddling of that, should be assigned?

A. How many carloads of state freight have you?

Q. I don't know.

A. I want to know the ratio of that train. Your assumption ought to be based upon some example that would be——

Q. If you wish to illustrate it you can do so.

A. I would not like to answer that question unless you would indicate what is in your train.

Q. I would not undertake to indicate that except that it has state and interstate. The state distributed locally and the interstate among two or three of the larger stations.

2790 I am not asking you for amounts, I am asking you where you would apply the extra expense growing out of the service incident to the peddling out of that state freight?

A. I would have to have the tons and ton miles in your train of each character of traffic. The question could not be answered with any degree of accuracy by any one unless they know what is in your train.

Q. You cannot answer it unless I give you the contents of the train?

A. If you want to know that, I want the character of the tonnage.

Q. Mr. Wharton has assumed that each engine is the equivalent to two and one-half car miles, in Exhibit K for the purpose of division of "Maintenance of way and structure" expense: You do not make that concession, do you?

A. No, he is too liberal to you people.

Q. What do you think about that?

A. He increases that local engine 50% because he has added 50% here to a local car mile, and a corresponding increase is made for the engine miles. He is extremely liberal in that allowance, in favoring the interstate business.

Q. Do you think that any allowance at all should be made on that account?

A. Not for maintenance of way, no, sir.

Q. Do you know on what basis that allowance is made by
2791 Mr. Wharton?

A. I suppose he has accepted some of the theories of the railroad experts in this case.

Q. Do you assume that because you do not know of any reason why he should adopt that equivalent of two and one-half times?

A. It is absolutely absurd to me. I don't know of any reason for it.

Q. How about the 50%——

A. It is favoring the interstate business without any reason. He is doubtless following out some theory advanced by some of your experts.

Q. If it is proper to make an addition to the local engine mileage on account of station switching, is 50% a proper amount?

A. I would not make any allowance whatever, because the local train is the workshop for the railroad, as I stated before, and performs switching services for these through trains.

Q. Now, going to "Maintenance of Equipment":

You have divided the expense of maintaining locomotives in two parts, yard and road. You divide the yard expense on the basis of yard mileage and the road expense on the road engine mileage. You make no allowance on account of possible extra maintenance due to yard service in your division, do you, as was done by the State?

2792 A. Not as between through and local trains, no, sir.

Q. Do your views differ about the propriety of that from that of the state accountants?

A. Yes, sir, they have again been liberal with you by following the theories advanced by Mr. McPherson.

Q. Why do you think Mr. Wharton was wrong in making that allowance?

A. Because it is not real. It is an arbitrary allowance that has no ruling of law.

Q. Before I leave that, what is this yard engine mileage, what do you include in that item?

A. Mileage made by the yard engines.

Q. How do you ascertain that?

A. From the reports rendered by those in charge of yard engines,

whatever method might be in practice by the railroad companies; that is ascertainable.

Q. Is the yard engine mileage divided between local and through service?

A. On the basis of the actual cars handled for each class of trains. That can be ascertained by check made of the wheelage reports and other reports made by the yard.

Q. How do you ascertain that?

A. By the car numbers of each train when they come into the terminal and go out.

Q. I thought that was on the basis of yard engine mileage: that would be car mileage if it was divided on cars——

2793 A. Well, it is ascertainable and should be divided on the mileage made.

Q. How would you ascertain that, Mr. Wilmering? I want you to explain that. If it is ascertainable I want to know how it could be ascertained.

A. I have not made an investigation of the method of keeping this mileage with reference to the Iron Mountain System, but I have every reason to believe that it is ascertainable.

Q. How do switching engines handle cars in switching them? Do they do it just indiscriminately, take up a number of cars, some belonging to one service and some to another?

A. The local train comes into the division terminal where they employ yard engines and yard crews. The road engine is detached and sent to the roundhouse and the yard force with the yard engine, under instructions from the yard master, breaks that train up and distributes it, or makes up other trains from the cars in that train, and vice versa, with refernce to the through train. The cars in each class of trains can be identified from the car numbers and a record can be kept.

Q. Does anybody in the railroad yard office keep a record of the yard engine mileage performed in the yard work? Do you know of any such instance in practice by any particular railroad?

A. That is a matter that I have not personally investigated

2794 and the records submitted in the case should be accepted.

Q. I want you to give me your opinion as an accountant, as to whether it is possible to keep an account of the yard mileage of engines engaged in that service? I mean mileage of yard engines engaged in yard service?

A. I am not prepared right now to give you an answer in detail, but it is a matter that I have not investigated so far as the Iron Mountain or the Cotton Belt accounts are concerned.

Q. My question is broad and applies to any railroad whether it is possible to do it?

Is it not impossible to do it on account of the nature of the service?

A. I am not prepared to give you the answer that your question deserves at this time.

Q. I will ask you further, if in point of fact, the mileage of yard engines is not, on account of the impracticability of keeping it any

other way, measured by time, and if, under the regulations and rules of the Interstate Commerce Commission, it is not kept at the rate of six miles an hour and accounted for on that basis?

A. I indicated that I wanted time to investigate this proposition before I gave you a technical answer.

Q. Now, let us see how you are going to divide your road engine mileage: you do that straight, do you?

A. Yes, sir, on the mileage of the road engines of each
2795 class of trains.

Q. Mr. Wharton added 50% to the mileage of road locomotives in local service to provide for extra switching mileage, and then added 50% to the switching mileage of the local train engines to provide for extra maintenance due to switching service, making 75 % additional to the local engine mileage: you do not make that allowance, do you?

A. No, sir, it is a very liberal allowance and it is favorable to the interstate business, and does not exist in reality. There is no reason for it.

Q. You think then that Mr. Wharton fell into error in doing that?

A. No, I think that Mr. Wharton was painstaking in his effort to follow the theory advanced by your experts in this case and apply the real figures to their theories and using their theories of maximum cost.

Q. You divide the expense of maintenance of freight cars on straight car miles, too?

A. Yes, sir, straight car mileage basis.

Q. Did you take into consideration the element of repair due to stopping and starting of trains at way stations, and due to the extra terminal handling of cars?

A. Not as between local and through.

Q. Why not?

A. Because it is absurd. One day the same car might be in a local and the next day in a through train.

2796 Q. You do not think Mr. A. M. Wellington would state an absurd thing?

A. I don't think he took into consideration the distinction, or made a distinction between local and through trains, to the extent that it should be applicable to a division of expense between state and interstate business.

Q. You think Mr. Wharton made a mistake in applying the statement quoted from Mr. Wellington on that subject in the way he did?

A. I think he wanted to be fair and impartial and that he wanted to follow the theories advanced by your experts in this case, and he wanted to apply those theories to real conditions and make a test. I think that is what he has accomplished. He used the maximum expense in all cases.

Q. I did not ask you if you thought Mr. Wharton wanted to be fair or liberal: I asked you if you thought he fell into a mistake

when he applied the proposition asserted by Mr. Wellington in his work that 21.5% repair expense of freight cars should be added——

A. For what reason?

Q. He set it apart as representing—as an extra applicable to cars in the local service, and if you will turn over and look on the next page you will see what he says, and in connection with it he has also set apart 13.5% for the repair expense: he does that on the authority of Mr. Wellington.

2797 A. He did not define it as a distinction between local and through trains. He is talking about——

Q. This is what he says:

"Mr. A. M. Wellington, (Page 203) says that the stopping and starting at way stations is the cause of approximately 21.5% of repair expenses of freight cars, and that the terminal handling is the cause of approximately 13.5% of the repair expenses. Taking these elements into consideration the maintenance expenses may be divided as follows:"

Then he added:

"Stopping and starting 21.5%.

Terminal handling 13.5% :"

I want to know if you think Mr. Wharton was correct in following Mr. Wellington's authority in making the division he did there?

A. Mr. Wellington made no distinction between local and through trains. The stops he refers to would doubtless occur in the through as well as in the local train. Through trains stop for train orders; they stop for crossings, and while the damage to the cars might be occasioned by these frequent stops, they occur in local as well as in through trains, and there should be no distinction between local and through trains.

Q. Now, we will turn over on the other side of it and see what Mr. Wharton says further about it. He says:

"Assuming that each local train makes a stop say each five miles and each through train a stop say each 20 miles, the local service should be charged with four times as much as the through service, in proportion to car mileage, for the expenses due to stop-

2798 ping and starting. Assuming also that each car in local service receives two terminal handlings (including handling at local stations) to each terminal handling of a car in through service, the local service should be charged with two times as much as the through service, in proportion to car mileage, for the expenses due to terminal handlings."

What do you say as to that?

A. That is rather a violent assumption. I think it is too much assumption of theory and it will not meet the conditions that really exist.

Q. Is it your idea that the whole basis and ground work of that division made by Mr. Wharton is wrong?

A. No, the basis is all right, but the extra arbitrary in making excessive charge to local trains and favoring through is wrong. The arbitrary added for additional cost.

Q. Do you understand that why he made that was in order to

make these divisions apply to the per cents Mr. Wellington said should apply to certain parts of the service?

A. My understanding is that he made that to apply these theories advanced by Mr. McPherson and Mr. Doddridge, and also in accordance with the theory advanced by Mr. Wellington.

Q. Why do you assume that the car mileage is a proper method of dividing the expense of maintenance of freight cars between local and through trains?

A. The car is the unit for the repairs and the repair is made to the car, and the greater the number of car miles made—it is the best unit that I know of.

2799 Q. Is the damage to cars in service affected by the weight and extent of the loading?

A. In my judgment, the weather and elements have a great deal to do with the damage to cars. That is the reason and cause for repairs.

The same as with a house that you build; there is a certain amount of depreciation and deterioration from the weather and the elements. The car is standing out on the side track. It is not under shelter like the engines are part of the time, and a greater part of the damage in my judgment to freight cars is from other causes than that of moving over the rails. A part of the damage is caused by overloading sometimes but that is the exception. The principal part of the damage, in my judgment, is caused by the weather and the elements and owing to not being sheltered like road engines are when they are out of service.

Q. What effect does the frequent stopping and starting of cars have upon them?

A. That has some effect.

Q. Does it not have a considerable effect?

A. To a part of the equipment of the car, yes.

Q. Mr. Wilmering, would not the damage to the car be influenced to a considerable extent by the extent of its loading and of the handling in the way of switching it?

A. Oh, yes, that would have some effect, but as between local and through trains there would be no distinction because

2800 the car may be used for through or interstate service today and local service tomorrow. Those things must be considered.

Q. When you divide this on a basis of car miles you disregard all differences?

A. We use the car mile as a unit. Today that car might be in interstate service and tomorrow in local service, as I stated before. Those things must be taken into consideration.

Q. If a large part of, or at least to the extent that the damage to cars does not depend directly on the miles run and depends on elements and such things as painting and renewals and depreciations of that sort which is caused by the elements—on what ground can you say that that kind of expense would be charged on a car mile basis?

A. We have got to use some arbitrary basis and in railroading the

cost account has not been brought down to the fine point that it has in industrial accounting. It might follow that some day a better basis could be determined, that the repairs could be identified with each individual car, and that the car itself could be identified as between train service. In view of the fact that an accounting has not been made or planned that would produce results of that kind, I don't know of any better basis than the car mile.

Q. But it is an arbitrary assumption, is it not?

A. We must use some arbitrary basis because it is a new thing among railroad accountants themselves, this division of in-
2801 terstate and state expenses. There has been no occasion for it until these recent litigations have occurred. Many railroad accounting officials have told me that personally they had not given it a thought until recent years, this division between state and interstate business, and for that reason they had not established any methods or any system for real cost accounting. And further, I understand you have a pooling arrangement with the Iron Mountain and that your expenses are not identified with the car outgoes, and that is the best basis in your case that I know of.

Q. Do you believe that railroad accountants ever will be able to ascertain the expense attributable to each individual car?

A. That they ever will be able to do it?

Q. Yes.

A. A great many things have been accomplished in accounting in recent years. I don't think it is impossible to do that, no, sir. I think that each individual car can have an account established and all expenses due to that car can be located to an extent where the degree of accuracy will be greater than the degree of inaccuracy.

Q. I believe that you testified that you could ascertain it by ascertaining the repairs to——

A. Oh, no; I testified that repairs had been ascertained to each individual road locomotive on the M. K. & T. road.

2802 Q. Have you any idea how many cars of the Iron Mountain system, how many engines are repaired annually?

A. No, the records would be the best evidence of whatever it is.

Q. I understand. We will take engines, for instance: there are at least ¾ million engine repairs annually on the Iron Mountain. I mean distinct and separate repairs. Many of them, of course, made upon the same engines, but separate and distinct repairs.

Would it not require an immense amount of bookkeeping to identify and charge those to the individual engine repairs?

A. It would require a good deal of bookkeeping. The M. K. & T. are doing that today. Mr. Se[illegible] spent nearly a day's time with me showing me the detail of how he accomplished and found out the actual expense of repairing each engine, and an account is kept with each engine for repairs and renewals and the depreciation is charged for each engine.

Q. Didn't he tell you they were trying to keep the same kind of a record for car repairs?

A. He indicated that eventually the railroad accounting officials would be compelled to do that, owing to this state of litigation, and

he had great hopes that they would finally accomplish something in that line.

Q. I suppose we might safely assume that there are 20 cars to an engine, probably, in service; maybe more or maybe less,
2803 but I just say that to illustrate:

Mr. Johnson tells me that there were repairs made of 557,210 freight cars on the Iron Mountain in the year 1909.

Some of them were foreign cars and some were domestic cars.

I want to ask you if you know or could you suggest any system by which each individual car could be charged separately with the expense that pertained to it, and then how would you divide that between the cars that belong to the company and the foreign cars that belong to other railroads?

A. That is a very difficult matter and it would be difficult to accomplish, and for that reason, in the division of repairs to freight cars and renewals, we have used the arbitrary basis of car miles; but I believe that such results will be finally obtained sometime in the future.

Q. What does "Supervision and General" under the head of "Maintenance of equipment" embrace?

A. All other expenses incidental to "Maintenance of Epuipment."

Q. You say you divided that on the basis of direct Maintenance of Equipment: Do you mean on the basis of division you have just been speaking of?

A. On the basis of the located expense; on the basis of the direct in that general account, maintenance of equipment.

2804 Q. What are the direct expenses, those you have been speaking of, damage to engines and cars——

A. Repairs and renewals to locomotives, yard, (*a*) and (*b*) as indicated in the exhibit, and all other expenses incidental to maintenance of equipment?

Q. How do you divide "Traffic Expenses"?

A. Traffic Expenses?

Q. Yes, you stated here on the basis of the total direct for actual expenses accrued within the State.

A. Yes, sir, I will explain that to you.

I would give no consideration whatever to any expense that accrued for traffic expense outside of the state. All those expenses that accrued any where outside of the state should all be charged to interstate traffic and no consideration should be given that for state business. But on the expense that actually accrued within the boundaries of the state, for traffic expenses, I would divide those on the basis of the total direct operating expenses.

Q. What do you mean by "expenses incurred within the boundaries of the state" and by "expenses incurred outside of the state"?

A. Those outside agencies located, for instance, we will take the Iron Mountain Missouri Pacific located in the City of Mexico, San Francisco, New York, Chicago—those offices there are for the purposes of soliciting business from those points to points within this state, for example, for soliciting intermediate hauls across
2805 the continent. All of their time and attention is necessarily devoted to interstate traffic.

Q. You mean in the sense that where the agency is located—if it is located in Chicago or New York, you would charge all of it to the interstate business?

A. Yes, sir.

Q. And if it is located in Arkansas you divide it between state and interstate?

A. Yes, sir.

Q. What would you do with the salaries of the Freight Traffic Manager and his office force?

A. I would charge that to interstate business.

Q. What would you do with the service that foreign agents rendered, who made an arrangement with a theatre troupe to go from place to place in the state on local state trips between points within the state?

A. Your local would have to be business coming properly within the jurisdiction of your commercial agent or district passenger agent located in the state. If the man outside of the state interfered with his jurisdiction it is an exceptional case.

Q. What would you do with that?

A. That is such an exceptional case that the favor might be returned at sometime by your agent within the state. It is interfering with his jurisdiction down here.

Q. Suppose a traffic manager was to tell you that a great
2806 deal of competitive business from common points wholly local business, beginning and terminating in the state, was influenced to go to his road by the efforts of a foreign agency that happened to be located at headquarters of various concerns that had plants and industries in the state: suppose you had such a case as that, what would you do?

A. You would have to show me such a case as that. I don't believe they exist. If they did the traffic officials in this state would return the compliment sometime by soliciting business up in his territory.

Q. You put it on a reciprocity basis, do you?

A. That is what it amounts to in reality. The questions that you have submitted do not really exist. I don't believe those conditions exist.

Q. The paper handed to me by you states that you divide station expense account on a basis of the tons handled, the length of haul considered. I wish you would explain what you mean by that?

A. On all intrastate shipments I would charge for two terminals, for the terminal at the point of origin and the terminal at the point of destination.

For example, if we had 100 thousand tons of state freight and 200 thousand tons of interstate and trans-state freight handled, for
the two terminals I would double the intrastate tons, making
2807 it 200 thousand; then the ratio would be 50% for each, providing the interstate haul was 100 miles or under.

If the interstate average haul was over 100 miles, I would then charge the interstate tons for an extra division terminal.

If the interstate haul averaged over 200 miles, I would charge it with another handling at the division terminal.

I found from actual experience, and I can testify from my own knowledge, that the interstate, both carload and less than carload, is actually handled at division terminals, and this theory that has been advanced in this case and applied by Mr. Doddridge—this bridge theory—that this trans-state business going over a state as though it were on a bridge, does not in reality exist.

There are too many cripples side tracked or ditched in these supposed solid through trains and I have not given that any consideration at all, because it don't exist. I know from my own knowledge that cars of lumber handled from points in Louisiana and points on the Iron Mountain in Louisiana—I recall some moving to points in Oklahoma that have been delayed in transit from 60 to 90 days and have been weighed four or five times in transit; the way-bill itself showed that this bridge theory is an absurdity. It is nonsense and it don't exist in reality. It occurs to me Mr. Doddridge and
2808 McPherson tried to apply the ideal theories in railroading for the most economic management possible, but they have not accomplished their ideals and never will, I don't think.

So for that reason and owing to the fact that these interstate cars both less than carload and carload are handled at the division terminals if the length of haul is greater than 100 miles—that also double the tons handled in order to ascertain the ratio.

Q. Have you read the testimony of Mr. F. E. Ward in this case?

A. No, I have not read his testimony.

Q. Have you read the testimony of Mr. Sewall or Mr. Whitenton?

A. I believe I read Mr. Whitenton's affidavit in the application——

Q. No, I mean his testimony?

A. No, I have not.

Q. According to that basis you have just stated, you would charge all interstate freight, including trans-state freight, one terminal and then an additional terminal handling for every 100 miles?

A. Yes, considering the 100 miles as an average of the distance of division points.

Q. So you would charge all the freight that you cover under that interstate and trans-state with those terminal charges, would you?

2809 A. Yes, assuming the division terminals were 100 miles apart.

Q. Mr. Wilmering, I have heard some testimony in this case about the average length of haul; has that anything to do with these terminal expenses?

A. Well, it is a well known action in railroading that the longer the haul the less charge per ton per mile, in short hauls the rate per ton per mile is always greater for both state and interstate, than it is for long hauls, and particularly so for state business, because on short hauls the standard local distance rates ordinarily apply, and on interstate business the business is largely competitive and the rate of charge is low in comparison to the ton per mile.

Q. What do you include in that item of "Station service"?

A. I include account 68, "Station employés," Account 72, "Sta-

tion supplies and expenses," and Account 100, "Telegraph and Telephone operation."

Q. That includes all of the stations as far as the station agent, cashiers, stenographers, clerks, bill clerks, platform men, truckmen, warehouse——

A. Warehouse men, freight loaders and unloaders, tally men, delivery men——

Q. You charge that to trans-state freight every one hundred miles in passing through the state of Arkansas?

A. Yes, sir.

Q. Do you know what the percent of trans-state tonnage
2810 on the Iron Mountain road is?

A. No, I don't.

Q. The exhibits in this case show that the trans-state tonnage of the Iron Mountain is 51 per cent, and on the St. Louis Southwestern it is 64 per cent, the ton miles on each line:

Would there not be a pretty considerable——

A. The ton miles would not be the index. It is the tons handled. The tons handled, I see only represent 33.61 for trans-state——

Q. You say that would not be a proper index, a proper criterion?

A. Made on the basis of the tons handled instead of the ton miles.

Q. On the Iron Mountain railroad the tons handled are 33% of the total and on the St. Louis Southwestern 44% of the total: To that extent in those proportions, that tonnage would be chargeable to these expenses every hundred miles passed over in going through the state of Arkansas?

A. A percentage or the ratio of tons handled as to character. Whether trans-state, local, interstate or state, would not appeal to my mind in any way whatever, because it is actually handled at these division terminals irrespective of character or class.

Q. Mr. Wilmering, a carload of goods starts from St. Louis
to go to Alexandria, Louisiana: that car passes through
2811 Hoxie, the division point in the state of Arkansas: are there any charges collected on it at that station?

A. No, the expense of collecting the charges would be infinitesimal compared with the entire expense attendant at stations.

Q. What duty does the station agent at Hoxie discharge in regard to that carload?

A. He has general supervision of the yard and ordinarily has the direction of the yard master——

Q. What does the cashier do?

A. He accounts for the revenue.

Q. I mean about that particular car of freight: what has he got to do with that?

A. He might have a great deal to do with it, depending on circumstances and conditions which happen in railroading every day. It might be the agent has assigned to him the duty of making damage reports or advising the proper officials with regard to a car with a hot box, or a car in a damaged condition; or it may be the car would be transferred at that division point.

Q. What if it is not in a damaged condition?

A. It would be incidental to station expenses, that is all.

Q. What are the duties of the bill clerks and the delivery man, what duties would they discharge?

2812 A. Well, those positions are all incidental to the station service. Of course, the cashier might devote all of his time and attention to the passenger business in selling tickets and not any part of his time to handling freight. He might have an advising clerk to give his attention to the freight accounting. Different conditions exist at different stations.

Q. I called your attention to those details, not so much because they are of any importance, but I wanted to ask you in connection with those details to which I have called your attention, if a very large proportion of the service that is rendered covered by this heading of "Station expenses" is not absolutely inapplicable to trans-state freight in its passage through the state of Arkansas?

A. Oh, no; I don't recognize that distinction or any distinction between the service performed at terminals as between any character of freight.

Q. I am not talking about terminals, but division points.

A. Or division points, then. I have in mind the division point I am acquainted with.

Q. And you make no distinction?

A. I have given that much careful thought and consideration and have come to that conclusion; I cannot draw any distinction nor any theory. If you apply the existing conditions to the theories advanced you find the theories are destroyed.

2813 Q. Do you propose to divide yard and terminal expenses on the basis of cars straight without any allowance of any sort?

A. Yes, sir, because it is obvious that it does not in reality cost any more to switch a car for a local than for a through train.

Q. What is "yard terminal expense", that is, what does it include in connection with the operation of industrial tracks, tracks to elevators and things of that sort?

A. It is incidental to the yard service, the placing of cars at industry tracks.

Q. Do you undertake to say that an equal amount of service is rendered to the cars containing trans-state shipments and those containing local shipments?

A. Oh, yes; they switch the trans-state cars around in the same bunch of cars that they switch the other cars, and they often break up blockades on the sidings.

Trans-state cars are not exempt from switching at all. They get just as much shifting and switching as the other cars. The theory is nice, but the conditions differ from the theory.

Q. Let us see, now, to illustrate:

There are five carloads of freight originating at Little Rock; one of them may be at the Dickinson brick plant, an industry there; maybe another one is at a lumber yard; maybe another one is at a cotton compress; there are three of those cars that are hauled in

to those different plants and industries at which they had to be loaded, empty. That involves a movement. Then there
2814 was a haul back from the point at which they were loaded, to the yard in which they were hooked on to the train: That is true, whether an interstate shipment originating there, or a state shipment originating there; and it is also true of shipments coming in and destined to Little Rock, both interstate and state business: Do those services pertain to trans-state shipments going through the state of Arkansas?

2815 A. It is not applicable to any distinction that can be drawn between through and local trains; there could not be any distinction drawn there, because if switch engines performed that service at division terminals, or at other places where the engine is maintained for the through train, it equalizes that.

Q. Are not trains made up of cars that carry these different kinds of freight, trans-state, interstate and state?

A. That is theoretical; it is the exception when that is true; sometimes they carry a through car of cattle through the state; it is all theory, all bosh.

Q. You assume to divide the fuel and locomotive expense on the basis of the actual expenditure in the two branches of service?

A. Yes, sir, in so far as the actual expenditures for each class of engines for local and through engines and the other accounts incidental to that, fuel and locomotive expense is divided on the basis of locomotive expense for that particular item?

Q. Is that possible?

A. The account can be kept for each engine, and it can be ascertained; on some roads, the firemen signs a receipt for coal delivered to his engine; I think an accounting can be made for that.

Q. Those expenses, I suppose, run irregularly, and vary on different roads, or do they or not—fuel and locomotive expenses?

A. Yes, I have heard it said by some of the railroad men, trainmen, that one fireman could get more service out of a certain amount of coal than another; there are a great many things
2816 that enter into it; it depends on the grades, and on the condition of the roadbed a good deal. There is no distinction between local and through trains.

Q. Do you think you could ascertain the relative consumption of coal on one road by statistics you gather from the operation of locomotives on another road at another time and place?

A. No, but if you would get the total locomotive miles and divide that—you would divide the actual expense for fuel by the total locomotive miles, you would get an average, and with the average, you would strike a happy medium there, and I think it would be possible as a system for the railroad.

Q. That is not the way you propose to divide it?

A. No, sir, I would want to go into actualities as much as possible on these things; for some future accounting we have to take past accounting into consideration, and these things you can plan for the future, but your plans won't work for the past.

Q. Pass over these other details; you stated the conclusion that

you would finally apportion all train cost that we have been talking about on the basis of ton miles?

A. Yes, the established unit used by railroads for years past.

Q. It is the ton mile theory?

A. No, sir, it is a fact; it is the unit that is used in the real art of railroading.

Q. It is the ton mile basis of division?

A. It is the unit used by railroads, used for years and years.

2817 It has been used by the Pennsylvania and Wabash for many years.

Q. How long has it been used by the Wabash system?

A. I think I know of statistics compiled in '74 by the Wabash; I know of statistics followed by the Pennsylvania back in 1867, and some by the Houston & Texas Central way back in 1860.

Q. Dividing the expenses for conducting state and interestate traffic——

A. That is a different thing; that is a new thing; everybody is a "tyro" in that, the railroad and state's accountants are all beginners at that.

Q. Is that the only unit of division that is used by railroad accountants?

A. Yes, except one that was invented by some shrewd railroad lawyer for these cases,—the revenue basis.

Q. What are you speaking of now?

A. This theory that it does not cost any more to earn a dollar by switching freight, than it does to earn a dollar running a passenger train, or freight train, or carrying a mail car; that is the foundation for it; it is absurd.

Q. I thought you said under the system of apportioning expenses between state and interstate business, that it had not been attempted by railroads until recently, wasn't that what you stated a moment ago?

A. No uniform system has been established.

Q. What I want to get at is this, for what purpose has the ton mile unit been used in making divisions which you referred

2818 to in your answer awhile ago.

A. In this proposition here—we tried to explain that to you; this exhibit submitted by Mr. Wharton, I believe that he really endeavored, and by the pains-taking methods he employed, and by the rigid way in which he went after the facts, that he attempted and did apply the theories that were advanced by numerous railroad experts with reference to the difference in cost of operation of local and through freight trains, and that he, after he located on their theories the maximum additional cost for local trains, then the final apportionment has been made upon the long established ton mile unit, after the extra cost has been ascertained.

Q. Isn't there some other unit such as train miles, and car miles used by the railroads for the purpose of making divisions?

A. Thos- divisions are incidental to a particular class of expense, with the locomotive mile and with the coach mile; those are classes of expense that are incidental to the equipment.

Q. Now, aren't those two units, car mile and train mile, used right in conjunction with ton mile by the railroads, all the time in practical accounting?

A. Not for cost, not for division of expenses.

Q. Isn't there three units, and according to railroad practice, aren't those units used concurrently and directly for the purpose of bringing about the divisions that are made by railroad ac-
2819 countants in the different branches of the accounting service?

A. They are used in the division of expenses as indicated in my exhibit here, and are used in the division of expenses for the reason that they are incidental to a certain part of the expense, certain primary accounts,—incidental to certain primary accounts, but here is the proposition you are selling tons carried one mile, while the rates are based upon the ton; you are selling transportation and the unit is your ton; what we want to find out is what does it cost you to carry that ton.

Q. The railroads are not selling tons?

A. You are selling ton miles.

Q. What the railroad is selling is that space in its car which is occupied by the tonnage it carries, and that service which is necessary to move that tonnage, that is what the railroad is selling, isn't it?

A. The unit for measuring it, and the unit for selling it, is the ton mile.

Q. You have already testified that the railroad divides between passenger and freight cost of maintenance of way on the revenue train mile basis?

A. Yes, that is the basis that has been commonly accepted by accounting officials; we have accepted their basis so far.

Q. There is one instance in which the ton mile hasn't been used; don't you know that running right through it, these various unites are used concurrently for different purposes?

2820 Q. (con'd.) And that none of them has ever been used by a railroad in keeping its accounts for the purpose of dividing its expenses of the traffic, between state and interstate?

A. I don't quite get the drift of that question.

(Question read.)

A. We are using these road miles, engine and yard miles for separation of expense between local and through trains, in order to ascertain the actual application of your own rules to conditions as they exist, or to establish rules that have been used by accounting officials to real conditions that existed, in order to find what is this extra cost, and whether it leads up to the maximum resulting from the preconceived notions of these railroad experts. After that has been located according to their theories, then the final unit is the railroad company's known unit, long established, and used by them,—the ton mile unit, and that finally determines the cost per ton per mile.

Q. In order to clear the matter up,—we seem to be talking at cross purposes—I will get you to explain what you mean by speak-

ing of ton mile as the railroad's own basis; I want to understand just what your meaning is?

A. It is the standard of measure or unit for freight cost, in the real art of railroading, that has been used for many years. The results are accomplished only after great expense and compilation from waybills, and it is an expensive undertaking, and if
2821 there was no real use for it, why would the railroads expend this money for working it out? And if it is not a good unit, why has it not been discarded? Great railroad men, very eminent railroad men, instruct their operating officials to watch the cost per ton per mile, and the results of operation over divisions, under the superintendents or direction of division superintendents and general superintendents, is watched from the ton mile unit by the executive officials. Why is it used?

Q. You referred in your last answer, I suppose, to the data used in the preparation of that index you spoke of this morning, for the purpose of ascertaining the cost of moving tonnage?

A. Yes, sir.

Q. Isn't it a fact that freight ton miles, freight car miles, and train miles, are the three units used in preparing and getting up that exhibit, and in connection with the total cost of moving tonnage?

A. Yes, the train mile is used to measure the efficiency of train service, and is frequently referred to by operating officials; the ton mile is used to determine the real cost of moving the tonnage in such trains, and from my own knowledge and from my own experience, I know, as I stated before, operating officials are cautioned to watch its cost per ton per mile; it is known; it is the standard for measuring for cost, but the traffic man who sometimes thinks the operating man is trying to step on his corns, with refer-
2822 ence to rate making, and he absolutely ignores this cost per ton per mile, and they have so testified in answer to questions which I submitted to them and that is the reason I state that rates are not made on the cost of service; they have an opportunity to get the average cost, but they don't make use of the index they have got, for the purpose of rate making.

Q. Is it the operating man who directs the method by which this cost is to be ascertained?

A. No, the executive officials really direct, and the accounting officials work it out for them, and this cost per ton per mile is constantly before the operating man, the efficiency of his division and the efficiency of his superintendents is judged by that cost as a rule. He has got the old man up at the home office jacking him up if he doesn't get the tonnage over the road,—ton miles—and when it comes to this rate litigation, from what I could extract from these accounting officials, they don't believe in the revenue basis themselves,—very eminent men—but these railroad lawyers, they ask them what is the simplest method, and they say "this is, the revenue basis is simple and not complicated", and he says "which is the best for us"—"the revenue basis shows the best result", and he says "We will use it, that is what we want."

Q. How did you get that information; have you ever been present at any conference between railroad officials and their attorneys?

2823 A. I extracted that from Mr. Nay on the witness stand, and Mr. Douglas; I can truthfully draw that inference from the replies they made.

Q. I will ask you now to tell me what testimony there is of Mr. Nay in which you extracted that,—what case was that?

A. It was a case down in Guthrie, Okla., in the rate cases remanded by the Supreme Court of our state down in Guthrie, sometime in November, 1908.

Q. Last November?

A. Yes, sir; It was the inference I got from his testimony, and in private conversations I have gotten a good many things that I wouldn't want to detail here.

Q. The details are confidential but the results are not. I want to ask you the question; you haven't answered that question I asked you awhile ago, if in making up this index which you have described so elaborately, freight train miles, freight car mileage and ton miles are not all used as factors?

A. They are used as factors in arriving at the final results; they are long established and recognized factors in railroad accounting.

Redirect examination.

By Mr. HILL:

Q. You referred to some statements that the Commission
2824 of Oklahoma wanted the railroads to make, a tentative plan of dividing the revenues and expenses between state and interstate; that was worked up early in the Railroad Commission's work, and you stated, as I understood you, that that was not agreed to by the railroad departments; do you mean that they did not agree among themselves, or did not agree with your commission?

A. Principally, they did not agree among themselves; they scrapped among themselves to beat the band in our conference; one would indicate that the other was crazy and the other would say "back at you."

Q. It wasn't a failure to agree with the auditors on one side, and the Commission on the other?

A. No, we made a number of concessions to them in the matter.

Q. Was that plan substantially what you have submitted here,—the plan here, you think that would best work out?

A. The tentative plan that we offered then?

Q. Yes.

A. No, the plan we started with was a plan approved by Commissioner Colquitt of Texas, but the same bases are used, car miles and the yard engine mileage, and the same numbers are involved, but there are arbitraries which we have since discovered were too elaborate and others that were too rigid, and ran favorable to the state and others unfavorable to the state, and I have come to the conclusion, by working out the figures, that have been submitted since and that

reports, that the basis is not as refined as the one we have at
2825 present to submit, and we finally permitted the railroad officials to make any division of the operating expenses they might themselves elect, and they have yet failed to elect a basis for separation between state and interstate. The reports issued by the Rock Island, indicate that there is no basis known by which such a division can be made, and recently they have complied with the order to some extent, by using the formula offered in the Arkansas rate cases, but they qualified their oath on the return, which destroys the effect of the basis.

Q. You mean the reports that have been submitted by the roads that dismissed their suits, and are testing the court tariff for a year, are those the formal reports you are referring to?

A. The basis used in these injunction cases, this revenue basis.

Q. They are making it on that now are they?

A. Some of the roads are, yes.

Q. Have you made that formula an exhibit to your testimony yet?

A. No, sir.

Q. I wish you would file this plan as Exhibit "C" to your deposition?

A. I will do so.

Q. Do you think that this Exhibit "C" is nearer a true separation of state and interstate business than the tentative plan that you worked out, and which Commissioner Colquitt had worked out in Texas?

2826 A. Yes, sir.

Q. I don't know that I quite understand your position on the local and through service, and I will state what I gather, and ask you if it is right and if not, wherein it is wrong; that you don't think it right to charge these additional sums which have been called arbitraries, like 50% local train for extra switching, and others, because you regard the local train and the through train as both doing state and interstate traffic, one helping the other one, and that the difference, if any, in the expense of local over the through, should not be recorded in the final division between state and interstate?

A. That is the position I have taken, yes, sir, that the services are largely reciprocal; there is a sort of reciprocity, and at division points where they employ yard engine service, it is true that the yard engine performs the switching for the local trains as well as the through trains, but all the switching that is performed for through trains as a rule, with very few exceptions,—as a rule all switching performed for through trains, interstate business, is completed by local way trains, at way stations.

Q. You don't question, as I understand you, that some of these would be correct if it were right to make the charge at all,—say Wellington's division based on more frequent stops for the local train as over the through—but your objection goes to making any
2827 allowance of that kind, when you go to consider a final division between state and interstate?

A. I object to making any such allowance; it is unfair to state

traffic, and extremely favorable to interstate, and the result is, you have extra profits on the interstate business; a lot of the through trains work is finally performed by local way trains.

Q. It is in evidence here that the Iron Mountain pools its car repairs with the entire Missouri Pacific System, on car mileage basis, and the percentage to Arkansas is ascertained on the car mileage basis, and so charged up in the exhibits filed by the railroad companies in this case; accepting that as a fact, could any other unit than car miles be taken to apportion the cost between local and through trains?

A. It is the commonly adopted unit and basis, and I think the basis that I submitted there is very fair.

Q. I understand that irrespective of its being a fair basis, but I say where they have reached the item of expense under that head between Arkansas and the other states that are in the pooling arrangement, you could not give any other basis upon which to separate that, could you?

A. No, the same basis ought to follow to the end.

Recross examination.

By Mr. MOORE:

Q. Who prepared this formula, "Exhibit C?"

2828 A. I did personally myself, without any advice of counsel.

Q. When was it prepared?

A. I had it in mind in my direct testimony, and prepared it last evening.

Q. Since you came here to St. Louis?

A. Yes; however, I would have prepared it before if the business of the Corporation Commission of Oklahoma had not taken all my time and attention.

Q. Is there any difference between that formula and the one prepared by Commissioner Colquitt of Texas?

A. Yes, sir.

Q. What is the difference?

A. There is a great deal of difference; in the first place, in maintenance of way and structures, the expenses between state and interstate is divided on the basis of the loaded car miles; I have used all car miles; I have never made a comparison to find what real differences there were; in fact, when I prepared that exhibit, I did not use or make any reference whatever to Mr. Colquitt's plan, but if you desire it, I will introduce Mr. Colquitt's exhibit and a comparison can be made.

Q. I will ask you to file it as exhibit "W."

Mr. HILL: I will object to that; it is very long; I have a copy, and I have gone through it; I have no objecting to going through and taking the bases and comparing them, but I object to its introduction.

A. I will file it as Exhibit "W," subject to the ruling of the master.

2829 R. D. PARKER, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. State your name, age, residence and occupation?

A. I am 32 years old. I am a civil engineer by profession; I am at present employed as expert engineer for the Railroad Commission of Texas.

Q. How long have you been employed by the Railroad Commission of Texas in this capacity?

A. Since January, 1909, about a year and a half.

Q. You say you are a civil engineer by profession?

A. Yes, sir.

Q. Were you educated as an engineer?

A. Yes, sir.

Q. In what institution?

A. Our own state University,—Texas.

Q. You took a university course in engineering.

A. Yes, sir.

Q. After you finished your engineering course, what business did you then follow?

A. I went into the government service for about six months; after that, I went into railroad location and construction work and remained there about—in that and kindred work—for about four years. For the past eight years, exclusive of the time that I have been with the State Railroad Commission. I have been employed in

2830 the operating department of the Houston & Texas Central Railroad and H. E. & W. T. and I. & G. N. R. R. service; my service with the I. & G. N. was principally in connection with construction matters. My duties in the operating department were confined to maintenance of way work. I had charge, when I quit the railroad service, of about six hundred miles of line; the direction of all bridge and building and track work, and the handling of all construction work, the work pertaining to that department was all under my jurisdiction.

Q. Did your work and duties bring you into contact with the operating conditions upon the road on which you were engineer?

A. Yes, sir, constantly, particularly for the last four years of my service.

Q. What was your service the last four years that brought you particularly in contact with the operating officials?

A. In directing the maintenance of way forces, it was necessary for me to be practically two-thirds of my time on the road; sometimes more than that. That movement over the road was on passenger trains, freight trains, in and about yards and terminals, and in fact, every part of the operating department nearly.

Q. Your duties then carried you into observation of the operating system of the road over which you were working?

A. Yes, sir.

Q. Since you have been an official of the Texas Railroad
2831 Commission, what have your duties been?

A. The examination and valuation of railroad properties within the state, for the purpose of making valuations as a guide to that commission in the limitation of stocks and bonds, and examination of facilities for railroad operation and railroad service where complaints were made, or where the commission desired to make any investigation involving particular conditions or physical conditions on railroads, and in addition to that, I have in charge,—that is, I represent the Commission in their jurisdiction over interlock and signals, which carries with it necessarily some information as to the method in which trains are operated.

Q. Have you made a study, both from books and actual experience and observation, of operating conditions upon railroads?

A. The study, since I have been out of college, has been largely a study of actual conditions that have come under my observation.

Q. Have you examined the exhibits in this case as filed by the state?

A. Yes, sir.

Q. I want to ask you,—I presume you have had no accounting experience?

A. No, sir, except so far as it pertained to maintenance of way work; when I was actually engaged in railroad work and in the study, I would naturally give it time, being interested and de-
2832 sirous of obtaining information that would be valuable to me in the future.

Q. Are you familiar with the basis or units on which expenses are apportioned to maintenance of way and maintenance of equipment and things of that kind?

A. I think I understand the units that have been used in these exhibits.

Q. Has your work made you familiar with the use of these units that you find applied in these exhibits? I am referring to "car miles" and "engine miles"?

A. Yes, from an operating standpoint, I think I am.

Q. The first application of any of these units is under the head of maintenance of way and structures, where there is a division made between local and through service on the basis of the total engine and car miles of each class, during a given period. I will ask your opinion of that division of this expenses between those two classes of service?

A. To my mind, it is about as representative a unit as could be applied; that is a unit that is representative of the service.

Q. There has been some question raised as to the amount of expense under that heading of maintenance of way and structures which would be occasioned by actual running of trains, and that which would be occasioned by the elements; have you formed an opinion from your service in the maintenance of way work as to the percentage of that?

A. I should say that there is no definite mathematical division

that you could make between it, but my opinion would be
2833 that possibly 90% of the expense of maintenance of way are not directly due to the wear and tear of track and structures.

Q. Assuming that to be the case, what is your reason for using the car mile as the unit to measure that division of expense between the two classes of trains?

A. It is representative of the service; the only classes of trains that we have operated over the roads are through and local trains; the road is built to carry freight; in so far as the freight business is concerned, and that is the means of carrying it, or the use that is made of it.

Q. You understand these accounts are relating to the freight department?

A. Yes, sir.

Q. You think then the representation that represents the use made of it, is the proper unit?

A. Yes, sir.

Q. In making this division, and in arriving at the number of engine and car miles, there has been added 50% to the engine mileage of local trains for station switching, has your attention ever been called to the switching that is done by locals at stations?

A. Yes, sir, local trains do practically all the switching.

Q. I wish you would state your opinion as to what percentage should be due for that switching service?

A. I think the mileage shown here for switching service for local trains is certainly a generous one. There is one test that occurs to
my mind in connection with that, and that is the relative
2834 amount of main line and sidetrack mileage. I believe in the case of the Iron Mountain, the statistics show that there is about one-third of the side-track mileage, as compared to the total amount of main line mileage, and if the local train in service used every one of the side-tracks one time, naturally it would only be about 33⅓%, and then another thing, a great deal of side-track mileage is used by through trains as well as local trains.

Q. The next item in this case to which I desire to call your attention, is that the accountanats have assumed that each engine mile was equivalent to 2½ car miles.

A. I presume that is calculated on a wheelage basis; a 12 wheel engine and 8 wheel tender would be 20 wheels compared to an 8 wheel car.

Q. Is that about the proportion used in this Southwest country?

A. You might say that is the maximum, except in the new type of locomotives, Mallet compound, which are practically two locomotives connected with one boiler and one firebox; that is called articulated; the locomotive is hinged in the middle.

Q. Where are they used?

A. In mountain divisions; I believe the Santa Fe has some in use and some of the western lines; I think the first one was exhibited here at the World's Fair.

Q. You are not referring to that exceptional class?

A. No, sir, there are none in the Southwestern country that I know of.

2835 Q. The next item of maintenance of equipment; the expense under that head is divided between yards and road locomotives, on the basis of locomotive mileage of each class during a given period; what do you say to using that basis to divide that expense of locomotives under maintenance of equipment?

A. It occurs to me that that is a little bit high.

Q. I am asking you first as to the general proposition, not about the percentage; the expenses are divided between yard, local and through, on the basis of the locomotive mileage of each class; I want to know if that is a proper basis of dividing that class of expense?

A. It occurs to my mind that that is.

Q. That 50% mileage made by locomotives to provide for possible extra maintenance due to the yard service——

A. That is the charge they have added on account of extra maintenance and not extra mileage.

Q. And then they added 50% to the mileage of road locomotives in road service to provide for extra switching, and then have added 50% to the mileage of road locomotives in local service to provide for the possible extra switching mileage, and again have added 50% to the switching mileage of the local train engines thus ascertained to provide for the possible extra switching, making 75% added to the engine mileage; that is what I want your opinion on, the arbitraries or added percentage, added to cover that phase of the case?

A. As I said awhile ago, I think the arbitraries are ex-

2836 cessive; they go a little bit ahead in the exhibits; the accountants who have prepared this report have applied an arbitrary of 13½% for repairs or maintenance of freight cars, due to terminal handling, which means switching practically, and I don't see why an extra amount should be added to locomotive repairs for maintenance of switching service more than for the cars; one reason for that is that the locomotive is heavier, a stronger machine, and does not suffer by the impact in switching as much as the cars, which are lighter structures.

Q. Do you think that the 13½% under the head of freight cars is a proper allowance?

A. I don't know; I believe I would raise that some, to possibly 16 to 20%.

Q. Take that other percent, taken on authority of Mr. Wellington, 21½% for the expense of stopping and starting the freight car.

A. The same criticism of the application of that arbitrary to the local for switching would apply; I mean, the same arbitrary applied to yard locomotives would apply to the locals doing the work.

Q. How much do you think that should be?

A. I don't see any difference in the two—the local and the switch engine, except in favor of the local engine.

Q. Those latter arbitraries were added upon the authority of Mr. Wellington's work. I will ask you if you are familiar with Mr. Wellington's work?

A. Yes, sir, we used it as a text book in my studies in
2837 engineering department at college.

Q. How is it regarded among engineers, and men studying the questions that are treated in his work?

A. It is taken as authority.

Q. Some question has been raised as to the date of Wellington and the date of this table from which this was taken; I believe it has been put back as far as 1887, the date when it was made; have you given any consideration to the effect of time upon these items?

A. Yes, sir, some.

Q. Have you any authority that would show any reasons or show any changes in the conditions?

A. I have before me the report of American Railway Engineers & Maintenance of Way Association, volume 5, of 1904, and on page 695 is a statement similar to Mr. Wellington's with some slight changes, which was compiled by Mr. G. B. Berry, now chief engineer of the Rock Island System.

Q. Read into the record so much of the statement as is pertinent here?

A. He contributes in table 2 on the page heretofore given, the statement showing the distribution of cost of locomotive repairs on the Union Pacific Railroad, and he applies to freight and work engines 7.35% of the damage due to getting up steam and terminal work, and to switch engines 12.474%.

Q. 12.47 where 13.05 is allowed in Wellington?

A. These figures I have just given apply to locomotive repairs;
the figures quoted here from Mr. Wellington are applicable
2838 only to freight cars; the figures given by Wellington for damage due to stopping and starting at way stations is approximately 21.5%, and Mr. Berry's table, the repairs to cars due to the same service is 20%, and the repairs due to terminal handling in Mr. Wellington's quotation is 13½%, and Mr. Berry's is 16%.

Q. Makes a total of 36, where Wellington's total makes a total of 35?

A. Yes, sir.

Q. What is your opinion of those Wellington figures and Berry figures, from your observation?

A. I think the switching damage is probably correct, but I don't think the comparison between local and through trains, in regard to damage due to stopping and starting is correct for the reason that the stops made by the local trains, exclusive of way station stops that the local trains have to make, that the through trains don't have to make, are about the same. Those stops are stopping for water, railroad crossings, stops to meet trains, stops to take water, etc.

Q. You recognize that these different items for which arbitraries have been allowed, are items which in the physical handling of the local train are causes of extra expense on that train over the through train.

A. So far as maintenance of way is concerned.

Q. This is maintenance of equipment we are on now?

2839 A. Yes, as far as switch service is concerned, I think cars get more damaged in switching than in any other way; next to that is deterioration due to weather conditions.

Q. Weather conditions would apply to both classes of trains?

A. Yes, sir.

Q. The point I am getting at is this, these various elements set forth here in maintenance of equipment for which arbitraries have been added, I will ask you if they are elements of extra cost of physical handling of one train over the other?

A. Yes, in so far as local trains do the switching and the through trains do not.

Q. And the more frequent starting and stopping, if that does exist?

A. Yes, sir.

Q. Then these arbitraries that have been put into these exhibits, in your judgment, and on the authorities you have read, sufficiently cover those elements of extra cost?

A. Yes, sir.

Q. According to the views you and these authorities express, they have more than covered it?

A. Yes, sir, from my observation, I think that is true.

Q. I am not discussing at all with you the question of whether it is right to charge those up between state and interstate, but merely between the physical handling of the two classes of trains?

2840 A. I understand.

Q. Is all this switching done by local trains for use of its own traffic?

A. No, sir, the local train carries through traffic as well. You mean as to state and interstate?

Q. No, I am disregarding that; that is a fact the traffic carried on local trains, or does it do any switching for traffic carried on through trains?

A. Yes, the through train frequently stops at a station in order to set out a car or pick one up, one that has been placed first out, as they call it, for the through train to come along and pick it up.

Q. Is that the common practice?

A. Yes, sir.

Q. And who would put it out for the through train, and who would take it away?

A. The through trains would set it out on the track to be taken up by the local train and set to the industry or set to the house track, taken to the stock pen to be loaded and do the various other station switching service.

Q. Has your observation as to the handling of through and local trains from division terminals been such that you could explain just how that service is handled in the division terminals?

A. Both classes of trains move into terminals and are broken up and classified and switched alike.

Q. Now, turn to yard and terminal expense, that is at page 4, these are divided between local and through business on basis of cars handled at terminals as explained under main-

2841

tenance of yard locomotives. I will ask you your opinion of that division?

A. I think it is logical and about as true a measure of the services as you could get.

Q. Now, the station expenses are not divided between local and through, but are divided between intrastate and interstate business, in proportion to the volume of traffic that each class handled at the station, that is "A" under "Transportation"; what do you think of that as a proper basis?

A. Well, in some respects the local conditions in the state in question would control that. From my observation, the basis is a good one. The division between intrastate and interstate—its handling is really the question.

Q. What I was particularly asking about. I wanted to call your attention to, was whether the division of that upon the amount of tons handled would be a proper division?

A. Yes, sir, I think it would, the relative amount of each business would reflect it.

Q. It would of course by local condition that would govern; the number of state or interstate or intrastate would govern?

A. Yes, sir.

Q. After the cost was ascertained, in the ways set forth in this exhibit, between the local and the through trains, then in the seventh sub-division of it, you will find that it is divided be-
2842 tween state and interstate on the volume of traffic of each, carried on the ton mile basis; I would ask you your opinion of that basis for that purpose?

A. It is as good a division as I know of; it is one that has been accepted and used for a number of years in the railroad service, in railroad accounting.

Q. You know that from your study of operating reports and your study of these railroad accounts, I presume?

A. Yes, sir.

Q. These various bases that are used here and applied to each of these items to which you have been testifying, I believe you stated at the outset were recognized bases by the railroads for various divisions which they made. I will ask you if in your own opinion, the expense between state and interstate could be properly divided on the basis of the revenue derived from each class of that business, state and interstate, and fairly reflect the cost of operation, as you have observed the cost of operation?

A. No, I have no conception of a division on the revenue basis, as reflecting in any manner, the way in which the service accrued; in the first place, the idea of expense carries with it the cost idea, and the basis would be on the cost not on the profit that accrues from the business; and any manufacturing establishment predicates the price of their commodity on the cost basis plus a reasonable profit; the railroad company has transportation to sell; while
2843 I don't mean to say that the cost of service controls the making of rates, there is a great many items that enter into that.

Q. After observing operating conditions then, you would not regard the revenue basis as a fair basis?

A. No, sir, of course I am not an accountant.

Q. I am asking you your view point, as you have observed and studied operation, whether those operating expenses which you are familiar with, and which you have studied, and incurred I suppose, can be properly reflected in a division between state and interstate by the revenues?

A. I don't believe they can, no, sir.

2844 R. D. PARKER, examination being resumed, deposed as follows:

Cross-examination.

By Mr. MOORE:

Q. Mr. Parker, you have stated that you had charge of about six hundred miles of railroad at the time you quit the railroad service, that you were employed in construction work and maintenance of way work; I suppose by that, you mean do you not, that you were engaged in such construction and re-construction as was necessary to keep the tracks in proper condition,—changes and additions?

A. Yes, sir.

Q. You were engaged in the line of your profession as civil engineer, in that work, were you not?

A. Yes, sir, a good many practical details that came up, it is true did not require engineering knowledge, handling men, etc.

Q. Your work was along the line of your profession?

A. Yes, sir.

Q. I suppose your studies have been along that line, have they not, for the purpose of perfecting yourself in your profession?

A. Yes, sir.

2845 Q. You were asked if your work brought you in contact with operating conditions on the road. In what way did it bring you in contact with operating conditions?

A. The construction work I had reference to in that case particularly was betterments of the existing line and improvements; naturally, those improvements were made upon all parts of it where trains were operated, and the other business of the road carried on.

Q. In that way, while you were engaged in your work as civil engineer in supervising such work and changes as were made, you mean you had the opportunity the presence gave you of observation?

A. Yes, sir.

Q. You stated that your studies since you left college have been largely of actual conditions that came under your observation. Has that also been with reference and from the standpoint of your profession as civil engineer?

A. My work has been in that profession, yes, sir, but at the same time I have made an effort to study operating conditions for my information, and in order to broaden myself.

Q. You did that, I imagine, in a very general sort of way?

A. I did it in every way possible.

Q. What I mean is, you did not actually undertake to participate in directing operating movements?

A. No, sir, my jurisdiction did not extent to the movement of trains, except in my work, work trains and trains handling
2846 material were under my jurisdiction.

Q. What you observed was what a man whose opportunities of observation was, from being at times where the work was going on, what his opportunity was to see,—that is what you mean I suppose?

A. Yes, sir.

Q. What was your title while you were in charge of that maintenance of way work?

A. Resident engineer.

Q. And your duties were such as those usually discharged by a resident engineer?

A. Not necessarily. The Southern Pacific organization is different to most of the roads, and I understand, different to the Gould Roads. The engineers are put in charge of track and bridges and building; they have jurisdiction over it and issue orders direct to the men; they control the labor, handling of material and direction of the work.

Q. That organization is not the same as on the Iron Mountain lines?

A. No, sir.

Q. There is a difference?

A. Yes, sir; my understanding is, that on the Gould lines, a resident engineer is only engaged in construction work, that is, new lines, branch lines, spur tracks to industries, and making surveys, that they do not actually handle the work and are not directly in charge of it, that the superintendent is the operating official
2847 that handles the track department, directs the roadmaster and bridge superintendents. In our case, the bridge superintendents and roadmasters are directed by the resident engineer, and the resident engineer in turn reports to the engineer of maintenance of way, and the superintendent too.

Q. If your impressions as to the duties of the engineering department on the Iron Mountain lines is correct, your understanding of the difference between their duties and the duties that were discharged by you, is that in addition to laying out and directing the construction or re-construction work, and you also had charge in a larger extent than they do on the Gould lines or Iron Mountain road, of the performance of the work, execution of the work, of the plans prepared by the engineering department?

A. My understanding is,—at least with the Gould lines in Texas,—the engineers make the plans and the operating department carry them out, and they act in an advisory capacity in a measure, as far as the location of line is concerned, grades and curvatures, etc.

Q. Is there a large volume of trans-state movement of traffic in the State of Texas over the railroads?

A. There is over the Southern Pacific lines; the movement of traffic from New Orleans and Galveston to the west, California points and intermediate points, between El Paso and California points, and there is a movement on the I. & G. N. to Mexico
2848 points; as I say, the greater part of the traffic was destined to Texas; it is right on the border of the United States——

Q. Are you familiar with the manner in which the two railroads engaged in this litigation handle their trans-state traffic in passing through the State of Arkansas?

A. No, sir, I can't say that from personal knowledge. Operating conditions, however, in the southwestern group do not vary a great deal.

Q. At the same time, it depends to some extent on the manner of handling that may be adopted by the railroad that is under consideration, as to the incidents of handling a particular class of track?

A. In so far as the method is concerned, I don't think there would be a great deal of difference. Operating men from Texas go up into the other states, and the operating men from Arkansas and the Territory go into Texas. They all have established methods by which railroads are operated and they do not vary materially.

Q. It is in evidence in this case for instance, that the Iron Mountain has established a yard at a place called Dupois, I believe, east of the Mississippi River opposite St. Louis, in which they classify and make up trains, classify cars and make up trains carrying trans-state traffic to Texas and Louisiana points, and that those trains are so arranged with reference to the handling of them en route, that those cars which are necessary to be detached in passing
2849 through the state can be handled with one movement; for instance, grouping them together in moving the train, if such an arrangement as that does exist, wouldn't it have the effect of diminishing the extent of terminal service applicable to that class of traffic?

A. Naturally, if the solid train moves through the state as a solid train, where there is nothing but an exchange of crews, engines and cabooses, that would be true, but I imagine there would be a very limited amount of that kind of business.

Q. I do not assume that it goes through as a solid train. My question assumes the contrary. Assuming that it is not a solid train made of cars carrying trans-state freight, but that it is a train in which there are cars to be set out in the State of Arkansas, but those cars are so grouped that they can all be set out on one movement.

A. It depends on the traffic in the train.

Q. Wouldn't that simplify and diminish the cost of terminal handling?

A. Somewhat; it depends on the relative proportion of the two kinds of business.

Q. In what manner do you understand that station expenses are divided?

A. In this exhibit here, it was divided up on the number of tons?

Q. You mean the total number of tons moved for the six
2850 months in question here?

A. The total number of tons handled.

Q. The total number of tons handled by the Iron Mountain Railroad in the State of Arkansas during the six months' period in question here, is that your understanding?

A. Yes, sir.

Q. If that is correct, and if the record in this case shows that 33% of that tonnage is business that passes across the state of Arkansas, would there not be a difference in the amount of terminal service rendered to that third of the traffic?

A. Yes, it would probably have some effect on it; you are mixing in your question, terminal handling and station handling.

Q. I used the wrong term, I meant station service, instead of terminal service.

A. There might be some effect, but I think the trans-state service would have the same expense attached to it in station work, in keeping the passing record of cars, checking cars in yards and telegraph service; the telegraph operators engaged in the movement of this trans-state traffic which you speak of, would have duties with reference to that, as well as this intrastate traffic. In some cases, the icing of cars, as I understand is done by station men, though in larger places, the different refrigerator transfer lines handle it through their own agents.

2851 Q. Would it in your judgment, be anything like as great as the service rendered to the local state freights and the interstate freight that originates or terminates in the State of Arkansas?

A. I would say the proportion would be in favor of the intrastate business, that is, as compared with what you call the trans-state business.

Q. Wouldn't you think then in that case, that the application of the division,—I mean on the basis of the number of tons handled in the state,—that class of expense would be unjust to the local traffic?

A. I don't know that it would; I don't know any nearer basis that you can establish.

Q. Do you know whether a great deal of that station expense is chargeable to and grows out of the incidents of the handling of L. C. L. freight?

A. Yes, sir, but usually the proportion of less than carload freight is very small; that is, the proportion as compared to the total volume of business.

Q. That is true, but when you take the ratio that there is between that and carload business,—state business,—it is pretty hard, isn't it?

A. Yes, these agencies are maintained for business as a whole.

Q. That is all very true, but I want to call your attention to the fact while L. C. L. business is not a large proportion of the business of a railroad, it is a considerable proportion of the state
2852 traffic, and it is not an unimportant proportion of the interstate business which originates or terminates in the state,

while it is an infinitesimal proportion of the trans-state business; I wish to call your attention to these three conditions that exist and ask you if in view of those conditions, it would be a proper basis of division of station expense?

Mr. HILL: I think it would be only fair to state the percentages of L. C. L. interstate and L. C. L. state.

Mr. MOORE: I have no objection.

Mr. HILL: Here is your exhibit #26, he can state them from that.

Mr. MOORE: Just let him answer the question as I put it; we do not accept that.

A. I think you have exaggerated the proportion of less than carload traffic in your state and interstate business, in the way the question is framed; it is a very small proportion I think in both; the carload movement would be in excess.

Q. Regardless of the proportions of carloads and less than carload traffic interstate and trans-state business, isn't the expense of state less than carload traffic much larger per ton mile than the trans-state less than carload, so far as the State of Arkansas is concerned?

2853 A. I don't know what the local conditions are in the State of Arkansas.

Q. Isn't there a difference between the two classes of traffic which exists of necessity and would apply everywhere, which would establish the proposition that a very much larger proportion of the expense is applicable to state L. C. L. than to trans-state L. C. L.

A. I think it would; the trans-state L. C. L. shipments move through the state in solid cars, probably they are not broken at stations, except perhaps at some points where they make transfers of the cars into different cars; some particular cause might come up in the operation of trains that it would be best to handle it that way, where it could be handled or transferred cheaply, but that less than carload movement which passes entirely through the state, of course, would not be as much affected as the less than carload movement within the state, or as between the State of Arkansas and the other states, or interstate business.

Q. Leaving out of the question for the present the proportions, but assuming that there is a class of traffic, carload and less than carload, to whatever extent those differences may exist, isn't it true that the plan adopted by the state of dividing station expenses according to the number of tone handled in the state is unfair as between the trans-state traffic and the other classes of traffic?

A. I don't think that it is; they have assumed a propor-

2854 tion here of one to two, I think; they assume that each intrastate ton is handled twice and each interstate ton once. I don't think that is unfair; it would represent conditions, I think,—that is in Texas it would.

Q. That assumption of the two state handlings of state business and one of interstate is not made as a concession because a greater or less service is rendered to one than the other, but because there

is in fact two station handlings of every ton of state freight and one of every ton of interstate freight, so that it does not change conditions at all; that is not an allowance in favor of any one class of traffic?

Mr. HILL: Are you testifying to those facts, Mr. Moore?
Mr. MOORE: I think they are in evidence here.
Mr. HILL: I think the very opposite is shown by the testimony.

Q. If that is correct, that there is in fact two station handlings of state freight to one handling of interstate freight, does the allowance which is made there and which you have just called attention to, do more than place each one on the basis it belongs on, as far as station expense goes?

A. Yes, sir, I think so.

Q. And it still leaves the effect upon any different condition that might exist in relation to trans-state movements of freight
2855 the same as we have been discussing, doesn't it?

A. I don't think it would affect trans-state movements a great deal.

Q. Judge Hill called your attention to the fact that in the formula contained in Exhibit K, after the cost was ascertained in the way set forth in that exhibit, between local and through trains, then the seventh sub-division of the exhibit divides it between the state and interstate on the volume of traffic of each on the ton mile basis. He asked your opinion of the correctness of that basis to which you answered that it was a good division, and one that had been accepted and used for a number of years in railroad service and railroad accounting.

A. My understanding is it is used in railroad accounting; I do not qualify as an expert accountant, and my judgment and opinion of these bases is largely upon what it conveys to my mind in point of equity.

Q. I am calling your attention to it now to give you an opportunity to explain what you do mean; you do not mean to state that there has been any system of accounting in practice by railroad operators, by which the cost of railroad operation as between state and interstate traffic has been divided on the ton mileage basis?

A. They have not settled that question yet, as I understand
2856 it.

Q. I am asking about railroad practice and the manner in which division- are made by railroad accountants?

A. I cannot say as to the detail of the compilation of the figures.

Q. Do you know of any instance in which any railroad operative or accountant has assumed that the ton mile basis would be a proper basis upon which to divide the expense of operation as between state and interstate traffic?

A. No, sir, I do not believe I have ever heard them commit themselves to that; in fact, this subject is a rather new one.

Q. In expressing your view as to the value of the gross earnings as a means of division for the purpose of adjustment, speaking of, and for the purpose of illustration I suppose, you stated that the

basis should be on the cost, not on the profit that accrues from the business, and then in illustrating you say, any manufacturing establishment predicates prices of their commodity on the cost basis, plus a reasonable profit.

A. Rather than on the profit basis.

Q. Rather plus a reasonable profit?

A. I said rather than upon the profit; I think my answer explained it later on; if not, it should. I meant to say the cost of production controlled in making the prices. It was not my intention to state that the prices of the commercial establishment
2857 were based on the profit at all, but upon the cost of production, and the price would be that cost of production plus a reasonable profit.

Redirect examination.

By Mr. HILL:

Q. Following this explanation, and considering the two sorts of revenue that a railroad company receives, one from state traffic and one from interstate traffic, pre-supposing a reasonable profit is put into the rates for each, in order to make the revenue basis of dividing the expenses equitable, that proportion of profit on each rate would be the same, wouldn't it?

A. Yes, sir, for a mathematical ratio to be correct, it would have to be the same.

Q. That is another element of uncertainty in the revenue basis, as well as the fluctuation in the cost of service?

A. Yes, sir.

Q. If rates were made on the theory that you have suggested about a manufacturing plant, to be the cost of production plus a reasonable profit, there would be no occasion for any extra expense being adjusted to state or interstate as the case might be, would there?

A. No, sir.

Q. In referring to the station expenses apportioned on the
2858 basis of two tons for interstate and one ton for state—I mean, one ton for interstate and two tons for state traffic, I will call your attention to the cotton movement and the grain movement. Are you familiar with how those two commodities are handled, in a general way without the detail?

A. Yes, sir.

Q. Both are interstate commodities very largely; how many handlings would those commodities have, in the usual course of transportation?

A. In the case with the most of the cotton movement in our state, it is moved from point of origin in cars and placed at the compress and compressed in transit at the first compress it comes to; the commission has a rule of that kind, requiring them to stop at the first compress en route; it is handled there, the railroad company doing one handling and the compress company people the other; then the cotton is moved to ship-side for export, or to the mills where it is consumed in the state; hardly any compressed cotton moves to local mills; that proportion is very small; most of it is export cotton.

Q. That is a negligible quantity; that represents then three handlings; do you know how grain is handled into Arkansas from the northwest?

A. They have a milling in transit rate?

Q. Are you familiar with that?

2859 A. Yes, sir, it would be stopped at the mill and converted into the finished product and then shipped out.

Q. The finished product is largely a fiction, but that is the theory upon which it is moved?

A. That is the theory upon which the rate is made.

Q. That would have three handlings, wouldn't it?

A. Yes, sir.

Q. Have you, in making your statement that this is a fair division, taken those factors into consideration?

A. Yes, sir.

Q. I believe it was explained to you also about the terminal handlings of all interstate business of Fort Smith and Memphis, wasn't it? The evidence on that was explained to you?

A. Yes, sir.

Q. I want to call your attention to these figures which I give you from Exhibit 26; that exhibit 26 is filed by the Iron Mountain Railroad, showing the freight business of one month; it shows that the trans-state L. C. L. tons were 8,482 tons, and the total trans-state tons were 216,249 tons; you will find that in the first column, the L. C. L. being less than 4% of the total trans-state; considering that condition, whatever may be the station service accorded to trans-state L. C. L. tons, would that proportion to which I have called your attention, affect, as a general proposition, this division?

2860 A. Very slightly.

Q. Now, in division terminals, there is a station expense there; would there be any difference in station expense and division terminals between intrastate and interstate or trans-state either, in going through the division terminal I mean.

A. No, sir, it is all handled alike.

Q. Now, Mr. Moore assumed in one of his questions to you, that all intrastate traffic had two terminal handlings at a station, and all interstate, not referring to the trans-state, had one. Is that a correct assumption as you understand railroad operation?

A. It is not a fixed rule, no. He made the assumption and I agreed to it.

Q. You answered according to his assumption; I ask you if his assumption squares with your knowledge of operating conditions in that respect?

A. No, sir.

2861 C. B. BEE, being first duly sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. Please state your name, age, residence and occupation?

A. C. B. Bee, past thirty, Ardmore, Carter County, State of Oklahoma, present headquarters, Guthrie, capital of the State of Oklahoma. My position at present is rate expert of the Corporation Commission of the State of Oklahoma.

Q. How long have you occupied your present position with the Corporation Commission of the State of Oklahoma?

A. Since the 26th of December, 1907.

Q. What have been your duties in that position?

A. I have had entire charge of the rate department, and as such, have advised the Commission as to rates in effect in different states in the southwestern part of—the south and southwestern part of the United States, and the interstate rates in effect, the conditions governing freight rates, and assisted the Commission in making freight rates to govern shipments in the State of Oklahoma, and generally handling the rate situation in the state for the Commission.

Q. That has been your duty and to that you have devoted all your time since you have been there?

A. Yes, sir, to that and assisting shippers of the State of Oklahoma in cases before the Interstate Commerce Commission, and such matters, as that; my entire time has been devoted to rate matters.

2862 Q. Prior to your present position, in what work were you engaged?

A. At the time I took the position with the Commission, I was acting as Assistant General Freight Agent of the Mexican Central Railway.

Q. How much service have you done in railroad work?

A. Over ten years.

Q. In what different capacities, just briefly give your railroad experience?

A. I started in as stenographer to the division superintendent, his office stenographer; promoted from that to car stenographer, and through the different positions in the superintendent's office, such as overcharge and damage clerk, chief clerk, and then on the road with the superintendent as handy man, going where he directed; from that to the motive power department with the assistant superintendent of machinery, and numerous positions in the motive power department, and my last service in that department was balancing power, and I was transferred to the freight department, holding all the positions in the freight traffic department up to acting as assistant general freight agent; that is, commercial agent, all the rate positions, first, second, third and fourth rate clerk, chief

rate clerk, chief clerk of the rate department, commercial agent, division freight agent, general agent, and back into the office.

Q. Has your work in these various lines caused you to
2863 observe and in a measure familiarize yourself with operating conditions, as well as traffic conditions?

A. To a large extent, yes, sir.

Q. Since you have been an official of the Corporation Commission, have you made a study of operating conditions as affecting your work?

A. I have spent a very large part of my time in doing that.

Q. You are familiar with the rate situation, I assume from your previous answers, in this southwestern territory?

A. Fairly well.

Q. I will ask you what relation interstate rates prevailing in the southwestern territory, particularly in Arkansas and Oklahoma that you are familiar with, bear to the cost of the service, and what consideration is given in making interstate rates, to the cost of service for work done.

A. Other than a fixed figure which has sometimes been recognized in railroad rate making, I have never known of the cost of service entering into the making of a freight rate; that fixed figure has now been discarded, entirely by all traffic officials; it was the old bug bear of five mills per ton per mile, which was for years considered the actual cost of service on long hauls. That figure has been dropped, and no traffic man at present uses it, and freight rates are not made on the cost of service.

Q. What considerations govern the making of interstate freight rates?

2864 A. All the traffic will bear.

Q. Explain just what that means in rate making parlance?

A. It takes into consideration the commodity of the traffic, the value of the commodity, the points between which it is moving, the competitive conditions surrounding the movement, and, of course, regard is given in all instances to the nature of the commodity, and that is the nearest that a traffic man ever comes to the cost of service; the rates on a low value commodity, and one which will suffer very little from damage, are considered low grade commodities, while the reverse is true on high grade commodities; no traffic man would consider the same rate on oil as he did on sand, but he would not be attempting to place the cost of service upon the two, but rather the liability, and the rate that the two commodities would stand.

Q. That is, the relation of one commodity to another?

A. That is it exactly.

Q. That is best expressed in the classification of commodities, isn't it?

A. That is true; the classifications as published today largely govern those things.

Q. But even those classifications are full of exceptions, are they not?

A. Yes, sir, and made largely upon guess work.

Q. Are the exception sheets to classifications prevailing in Oklahoma?

A. Yes, sir.

2865 Q. Are you familiar with the exception sheets prevailing to the Texas common points?

A. I am.

Q. Is that large or small?

A. Very large.

Q. Are you familiar with the exception sheets prevailing in Arkansas traffic?

A. Yes, both state and interstate.

Q. That puts another variable quantity into the rates, doesn't it?

A. It does, and right in there, I might add that there is a feature which shows that rates are not built upon the cost of service, as one example comes to my mind now; emigrant movables moving from Oklahoma into Texas or Texas into Oklahoma, take Class D, I believe it is—C or D; while if they are moving Oklahoma to Kansas or Kansas to Oklahoma, Missouri to Oklahoma, or Missouri from Oklahoma, they take class "A"; if they are moving through Oklahoma from Missouri or Kansas to Texas, they take class "D," so that there would be absolutely no relation to the cost of service in the movement.

Q. That is a commodity where the liability for damage is considerable, isn't it?

A. One of the highest known, but it is a commodity at the same time, that railroads never seek to make a profit out of.

Q. Are you familiar with the zone or blanket rates that prevail throughout the Southwestern country on many of the large commodities, like lumber, grain and cotton?

2866 A. Yes, sir, and citrous fruits, coffee.

Q. I wish you would explain that zone proposition, and what effect it has in showing whether the revenue is proportioned to the cost of service performed by the railroads?

A. The rates on lumber, as I remember them, are from the Texas and Louisiana fields through Oklahoma, 18¾ being the last rate in Texas, and a rate made by the commission, slightly raised at the first station in Oklahoma, gradually varies until the last station in Oklahoma northbound on the Kansas line pays a rate something in excess of 26 cents. That rate immediately jumps in Kansas to 27 and a fraction, and goes on until it gets to Kansas City, Missouri, where it drops back to 23, if I remember the figures; for years the 27 cent rate existed in Oklahoma, but at a conference between the Commission and all of the railroads operating in Oklahoma, this rate was reduced to points in Oklahoma in order to keep a case from being filed before the Interstate Commerce Commission, which would have resulted in a general reduction of all lumber rates, and the only reason for the high rates at the northern points of Oklahoma, is that it only applies at two or three little stations where no business moves, and it was to keep Kansas from having her feelings hurt very badly in having a 23 or 25 cent rate at her border

that it was not reduced; they were afraid she would go before the Interstate Commerce Commission

2867 Q. That is a recent adjustment.

A. Yes, sir, May, 1908, I believe it was.

Q. Is that characteristic of every zone or blanket rate with which you are familiar?

A. That is the general condition.

Q. Our inquiry is more particularly confined to the situation in 1907; were you familiar with the lumber rate from territory south of the Arkansas river to the gulf *to* Mexico, that prevailed at that time—I really don't know whether there has been any change in it?

A. I am. There have been slight changes, but only slight.

Q. Give the effect of that as it existed at that time, if you remember it?

A. At that time the intermediate rates were higher than that—what was then known as terminal rates, rates applying to St. Louis, Kansas City, and often higher than the rates applying to Chicago. The Omaha rate at that time, if I remember, was 26 cents, or 25¼ cents, and the Chicago rate was 26 cents, while the blanket rate through the south, after leaving the Texas line, was in the neighborhood of 27 cents.

Q. I believe our map shows in 1907 that it was 23.

A. You are on the direct line; through Oklahoma it was 23 on the direct line, on the Katy, and I think you will find it in Arkansas, off the main line, they went to 26 and 27½.

2868 Q. For that service there was a 23 cent rate in that territory to one of these northwestern points; for that service, what different hauls were made of the commodity?

A. If the rate was 23 cents to an Arkansas point, and 23 cents to Kansas City or St. Louis, there was a difference from three to six hundred miles in the haul for the same rate.

Q. Suppose this lumber originated down in Louisiana on another line than the Iron Mountain or one of these, how would that rate be changed or distributed, whichever it happened to be?

A. They had through rates in effect with those lines and had divisions in effect,—I don't remember what the Iron Mountain's division was.

Q. I am not asking the actual division, but the proposition is whether that 23 cent rate would be divided with other lines?

A. Yes, sir, with numerous other lines, sometimes as high as three were interested in the division.

Q. That 23 cents would be distributed over as many lines as the commodity was handled?

A. Yes, sir.

Q. In ma-y of those cases, tap lines that had very short hauls would get a division?

A. Yes, sir, they got a division up to 1907; the tap lines did get a division of the rate.

Q. Are you familiar with how grain is handled into Arkansas, I mean on what rate from the northwest?

2869 A. A large part of it is handled in there on a flat scale.

Q. Milling in transit rate?

A. Milling in transit privileges being granted on it.

Q. That is an interstate movement?

A. You mean grain for local consumption in Arkansas?

Q. Yes.

A. It is handled in there from Kansas and Oklahoma, and the mills in Arkansas have the privilege of milling that grain and shipping it out at the balance of the through rate.

Q. How is it shipped out after it reaches a distributing point locally, through trains or in what manner?

A. If going to a local point, it is shipped on a local train; going through, it would probably be shipped on a trans-state train if they ran them.

Q. Depending upon the destination I presume?

A. Entirely.

Q. How are the rates made for this grain that moves from the northwest into Arkansas and consumed in Arkansas. On what basis?

A. Generally a territory is taken and embraced in a group; now, the Kansas rates to Arkansas, of course, I am not familiar with as I have not looked them up, but I know there are rates in effect from points in western Oklahoma which extend over to the center of Oklahoma, and those rates are flat, regardless of the point of origin, whether the extreme western point or central point of the group, or the eastern point of the group—the rate would

2870 be the same to Arkansas points.

Q. By a flat rate, you mean one that is flat for the group, irrespective of the number of carriers that handle it?

A. Absolutely.

Q. Now, in the practical working of these flat rates, what regard if any is had for the cost of service performed?

A. There can be no contention that the rates are made upon the cost of service, for a car of wheat moving from Alba and from Enid take the same rate; either one is exceedingly high and above the cost of service, or the other is exceedingly low and below the cost of service, where the rates are the same, and it is impossible to say that those two rates being exactly the same are built upon the cost of service in both instances.

Q. Owing to the difference in the length of the haul, and conditions under which they are handled?

A. Yes, sir.

Q. And the number of participating carriers in the common rate?

A. Yes, sir.

Q. There are various terminal handlings in that, and there would be large differences in the terminal handlings.

A. That is true; grain might come over one line direct, it might originate over at one station south of there and move at the same rate and move over three lines, and be handled through the larger towns and the big junction points where excessive handling charges occur.

2871 Q. How is cotton moved?

A. Handled?

Q. Handled and moved, state or interstate?

A. Cotton originates at one point, originates where it is grown, delivered to the railroad company on their platforms; if they are filled, upon their right-of-way, by the railroad company loaded into cars; moving generally at their option to a compressing point, there held on the cars until ordered to the compress; delivered to the compress, unloaded by the railroad company, again taken from the compress when the pressing is completed; loaded again by the railroad company and handled to its final destination, that cotton being treated as strictly L. C. L. freight.

Q. L. C. L. in its movement or final movement?

A. In its entirety; rates on cotton are always quoted regardless of quantity; the rate on one bale of cotton is the same as the rate on a thousand bales.

Q. I don't know about the cotton situation in Oklahoma, but it is an admitted fact in this case that there is practically no cotton consumed in Arkansas?

A. I know the State of Arkansas well enough to state that the part of the cotton consumed in Arkansas would be infinitesimal.

Q. The rate that you have been referring to then is a through rate from the point of loading of the cotton to its point of
2872 final destination, which is under these circumstances, necessarily out of the state?

A. Entirely so.

Q. It makes that whole movement, with possibly an infinitesimal quantity, an interstate movement?

A. Exactly. One thing more; in that cotton movement, cotton when billed from the point of origin to the compressing point is always billed on the local rate; it is then state business and so considered; it goes into the compress at this local rate, and when forwarded to its final destination, the rate from the point of origin to the final destination is charged, and either the local rate that has been paid in, is refunded entirely, or the difference between that and the rate from the original point of origin to the final destination is paid. That depends altogether on the consignee, how he wants to handle it.

Q. In this case, it is a proved fact that while the actual movement is as you stated, so far as the revenue is concerned, it is all carried as interstate revenue? How is that first movement of cotton usually made, on local or through trains?

A. It generally originates at small places and moves on local trains, either to the division point or to the compressing point straight, and as a general thing, the compresses are usually so situated that there is one at the end of each division, so that it seldom has to move by a terminal point to get to a compress though
2873 oftentimes the railroads allow big hauls for long distances and in some instances allow cotton to pass one compress and go to another.

Q. I believe you had some litigation before the interstate Com-

merce Commission, between McAlester and Muskogee on that proposition?

A. Yes, sir.

Q. What do you say as to the expensiveness of the cotton traffic as compared with the average traffic handled by railroads?

A. I think that cotton in its entirety is the most expensive commodity handled by the railroad companies.

Q. What are your reasons for that?

A. I think it entails great expense and more liability upon the railroad company than any other commodity handled, and the reason is that it requires a large force to load and unload. As a rule, cotton is loaded at small stations where there is but one man employed; it is necessary to bring the section foreman into that station to load that cotton on, else employ people there in the town to load it. Oftentimes, railroad companies pay the owners of the cotton to load it for them. Care must be taken to get a perfect car in which to load this cotton. After it is loaded, railroad companies by their rules require that the doors be batted, which requires an additional expense, and this batting is always thrown away at destination, unlike grain doors which are returned. This
2874 cotton must be placed in the yards at the compressing point, and it is a very unusual thing, during compressing season, if there is not an extra switching engine at all large compressing points; as cotton is not handled upon its arrival at the compressing point, but the people who own it hold it and there is no way for the railroad company to tell what car is next going to be called for. I have seen as high as five hundred cars of cotton laying in a yard, and some of them would be there twenty and some thirty days, some only three days, and every time a car is called for, it generally means the switching of that entire cotton yard to get that car out and switched to the compress. Demurrage and storage has not been charged on cotton heretofore; it is now, in order to do away with this extremely heavy expense. After cotton is moved to the compress, it is again put back in the car, the same processing being gone through with. In the cotton countries in our state, some railroads equip their engines with oil burners, in order not to throw sparks. They haul oil a long distance and do not handle oil on other branches of their road; it is merely to protect this cotton. Cotton moving from point of origin to the compress point is in big bales, and I think it requires about 2½ to three cars of open cotton or flat cotton to make one car of compressed cotton, so that
2875 there is that many cars moved into the compress which must move back empty for other cotton, and the liability on the cotton is very strong; it is always loaded at shipper's count at blind sidings, sealed after he closes the doors, seldom counted by the agent; fires have often been known to occur where there was a question as to whether there was a bale of cotton in the car at all.

Q. What is the casualty rate on cotton?

A. High, exceedingly so; once a fire starts in a bale there is no telling when it will stop, or when it will be discovered.

Q. What kind of rates are made on cotton to final destination? Do they vary with the distance, or what kind are they?

A. Ours is a flat rate of seventy cents.

Q. In what territory?

A. That is the rate to the New England destination from Oklahoma.

Q. Ours is 85 I think, but I am not certain; I would like to know how you get into New England States at less than Arkansas?

A. It is 70 cents to Galveston; we have a flat rate of 70 cents, I don't know just where it applies to.

Q. I am just inquiring of the principle?

A. It is a flat rate to the entire cotton group. There is a flat rate from our country to Galveston, and a flat rate northbound.

Q. Mr. Bee, have you inquired of a traffic man as to the
2876 rate from Arkansas to Boston?

A. I have; I understand that from Little Rock it is 80 cents, and from Fort Smith practically 85.

Q. What I am seeking to ask you—to what territory generally speaking without going into details, does that flat rate apply?

A. I should judge it would apply to what are called New England mills.

Q. And that would be anywhere in New England irrespective of distance unless there is some arbitrary charge to some given point?

A. There are some lines not participating in those rates possibly, but as a general proposition, I would say it would apply to all the New England States.

Q. The first end of that rate, does that usually call for an eighty cent rate from Little Rock and adjacent territory?

A. As a usual proposition that rate would apply from territory immediately surrounding Little Rock and some distance on either side, but owing to the Mississippi running along at their door, there may be some exception to that rate in Arkansas which I would not know.

Q. The Cimeron runs along your doors too, doesn't it?

A. So does the Cotton Wood.

Q. The point I want to call your attention to is this, that cotton starts at various points near by, goes to the trade center like Little Rock or Fort Smith, and is carried to Boston or nearby towns
2877 there, on a flat rate; I will ask you if that flat rate is irrespective of the number of participating carriers that handle it?

A. As a usual proposition it is.

Q. Then that eighty cents contains many divisions, or if it were possible to have one line of rails, there would be no division?

A. Yes, but I don't know how it would be possible to carry it to New England on one line of rails.

Q. That is carried between many terminals, I presume?

A. Yes, sir, and through the highly expensive terminals too.

Q. Do you know the blanket rate on the citrous fruit; I don't mean the actual figures but the principle upon which citrous fruit is handled from the west?

A. Yes, I think the rate is flat from the Colorado common points, I believe; that is, California fruit coming through, it is flat from Colorado common points, if I remember the rate.

Q. Let's see the practical operation of that; suppose there would be two cars of oranges started out from Los Angelos, carried from Los Angeles to El Paso, and over the Iron Mountain to St. Louis and then on East; one of those cars is dropped out—say there is a series of cars, one dropped at Houston, Texas, one at Texarkana, one at Little Rock, and one at St. Louis, and a half dozen carried further east, and the last one ends up at Portland, Maine, what would be the rate on those various cars I mentioned?

A. I don't know whether that rate applies to that Maine
2878 territory or not; assuming it does——

Q. Substitute New York for Portland, Maine?

A. I will assume that it applies to New York, but I don't know whether it does or not; assuming that it applies to New York,—and the tariffs on file here are the best evidence of the application of the rate, there would be a haul in there of approximately a thousand miles over that between the Little Rock car, the New York car, and if the New York car was pulled on the cost of service, there would be an exceedingly high profit made out of the Little Rock car or vice versa, somebody would lose money in carrying that car to New York.

Q. That is a trans-state movement so far as Arkansas is concerned?

A. It is what would be called a trans-state movement.

Q. If that is largely a trans-state movement, so far as the Iron Mountain and Cotton Belt is concerned, there would be a pretty small proportion of revenue attach to these companies for handling across Arkansas, wouldn't there?

A. You mean the revenue they would receive per ton per mile would be slim?

Q. They acquire their revenue in this case on a mileage scale?

A. Yes, probably the eastern lines would require the largest part of it.

2879 Q. I mean the proportion on the mileage scale would be for probably a run of three hundred miles through Arkansas?

A. Yes.

Q. And it would be at the rate of a pretty thin scale?

A. Yes, sir, such a rate on that car would be exceedingly slim, because the Southern Pacific would likely originate the business, and as the originating line would demand a large share of it, and the line at destination having the market would also demand probably a little larger share than the mileage pro rata, and I imagine a shipment of that kind handled by the Missouri Pacific would return a very small rate if they handled it.

Q. Have you just looked at the maps that are filed as exhibits in this case, showing the zone or blanket rates on various commodities, and are you familiar in a general way with the zones that are shown in these maps?

A. Generally speaking, yes, sir; I have had occasion to work in

these zones to some extent; Oklahoma is a part of most of these zones.

Q. There is a map there on Texas common points?

A. I am thoroughly familiar with that.

Q. State the effect on the revenue of shipments passing through Arkansas under that Texas common point schedule?

A. The conditions could be so changed on two carloads of freight of exactly similar commodities, loading from a given point
2880 of origin, to separate destinations in Texas that the revenue received by the lines participating in the business would be almost double on one car what it was on the other. That Texas common point rate applies from the North to the south, and from the east for a long distance west; the highest distance between two points being 662 miles, in what is known as common points territory.

Q. That is at the Texas end of it.

A. Yes, sir, I think that is the highest distance; I figured it out the other day for the Interstate Commerce Commission.

Q. How would that result be brought about?

A. The result would be brought about by two shipments originating at St. Louis, the cars being loaded with identically the same commodity, one being destined to Texarkana, Texas instead—take to the first point in the common point territory of Texas—I believe there are two stations in Texas (Referring to map) "Take two shipments originating at St. Louis, handled over the Iron Mountain, one destined to the first station in Texas, on the T. & P. R. R. south of Texarkana or west of Texarkana, the other being destined Big Springs, Tex. which appears from this map to be the end of the common point territory. The distance between those points is in excess of five hundred thirteen miles," and the rate would be exactly the same. Dividing the rate by the miles handled, figuring in mills per ton per mile, it would show a figure nearly one-half for the car destined for the last station as for the car destined for
2881 the first station. The exact figure would be easily worked out. In other words, the haul on one would be something over 513 miles more than on the other, and the rate would be the same per hundred pounds.

Q. What effect would the distribution of that rate between the different carriers in Texas, have upon the matter?

A. The other carriers in Texas would receive a part of the rate.

Q. Within that Texas zone would there be different carriers handling this commodity?

A. Yes, you can figure rates from defined territory to Texas points that would require the handling of three or more carriers to deliver the shipments.

Q. And others where it would be handled by one—the Cotton Belt I expect would.

A. That is really two railroads, the St. Louis Southwestern Railroad, and the St. Louis Southwestern Railroad of Texas. While really it is one line, it is two different corporations; the same would

be true of the M. K. & T., or any of those lines; they are all separate corporations when they get into Texas.

Q. Take further back from St. Louis, suppose it originated in Pittsburg?

A. The same condition would exist, but naturally the further back you got, the less disparity there would be in the rate, because
2882 the longer the total haul, the less disparity in the final result; if you take further south from St. Louis to the last point shown in defined territory on the Iron Mountain, which would be from this map, Grand Glaize, Ark., take a carload of freight from that point and figure to the first point in Texas, and a carload from that point and figure to a large point in Texas that this defined territory covers, it would show about three to one.

Q. Then run the other end of the scale; how far back does that go—to Pittsburg?

A. Yes, sir, that is the eastern limit.

Q. That, of course, takes a higher rate than to St. Louis?

A. Yes.

Q. The rates to Pittsburg and places in that country would be the same as the Pittsburg rate?

A. In the group surrounding Pittsburg, the towns would take the Pittsburg rate; the Chicago territory would take the Chicago rate; St. Louis territory, the St. Louis rate.

Q. Suppose there was a shipment from Pittsburg territory, say outside of Pittsburg from the steel mills to the farthest large town in Texas, what would be the farthest large town?

A. Big Springs.

Q. How many divisions do you suppose that rate would have?

A. How many carriers?

Q. I suppose each carrier would represent a division of the rate?

2883 A. Yes, I imagine you could break that up into ten or twelve if you were a mind to, or you could hold it down to probably three or four.

Q. There would be several?

A. It would generally take at least six carriers to handle it.

Q. From that territory in there down to the common points in Texas, that would pass through Arkansas on one or other of these two lines?

A. I would say the average would be four or five lines that would handle it.

Q. There would be a fluctuating condition of the revenue apportioned to Arkansas railroads handling the shipment?

A. Yes, it would hardly be the same on any two courses.

Q. It would be pretty near impossible to make it the same on any two cars, I suppose?

A. That would depend largely on the basis it was divided, whether it was a mileage pro rata or arbitrary pro rata or constructive mileage pro rata.

Q. Are all of those factors used in making divisions of rates?

A. They are.

Q. Are they variable factors?

A. Very much so.

Q. That seems to be another element that would enter into the uncertainty of revenues?

A. That is true?

2884 Q. Are you familiar with the system of rates from St. Louis to New Orleans and say from St. Louis to Little Rock or any other common points in Arkansas?

A. Generally speaking, yes.

Q. I don't mean the actual rates.

A. I have seen the rates and worked with them at times, had occasion to quote them.

Q. It is in evidence here, from Mr. Watson, that on various articles, I don't recall them now, where there is a higher rate to Little Rock than there is for the same article moving to New Orleans?

A. That would be possible and very probable.

Q. What is the situation that calls for that?

A. The so-called water competition, I presume.

Q. You say "so-called"; are you using that term accurately or figuratively?

A. I am using it accurately.

Q. Have you any water competitive rates in Arkansas and in Oklahoma?

A. We have some to Muskogee that I have never been able to see.

Q. On the Vertigree?

A. I guess it is on some such river, the Arkansas or something.

Q. I wish you would explain in a general way how these rates that are enforced in Arkansas are affected by this so-called water competition?

2885 A. There could be conditions existing under water competition where New Orleans could get into local territory in Arkansas, much cheaper than—on less than carload freight or otherwise, than merchants located in Arkansas could get into it from main producing points. I can illustrate that by a condition existing in Oklahoma that I know of thoroughly, where I do not know of Arkansas rates, and the factors that make them, and that would be necessary to pick out these conditions. At one time rates to Muskogee from seaport territory were such as, compared with Ft. Smith, that Ft. Smith could get a carload of freight in from seaboard territory——

Q. You mean Atlantic seaport?

A. That is known as seaboard territory; Ft. Smith could get a carload of freight in from Atlantic seaport territory, and there peddle it out, that is, L. C. L. it out right at Muscogee's door or ship it out as carload freight to Muskogee's door, cheaper than Muskogee could get that car in, and it was absolutely taking Muskogee's territory away from her; those conditions were changed, and do not now exist; that was due to so-called water competition at Ft. Smith.

Q. That was the Arkansas River or the Porto?

A. One of those rivers that does not bring any freight over it.

Q. There are a large number of rates in force in Arkansas
2886 and Oklahoma, that are based upon the theory of water competition when water competition does not exist, are there?

A. Yes, there are numerous rates based on that.

Q. These instances I have given you are rates that Mr. Watson has testified to, from St. Louis to New Orleans, being lower than from St. Louis to Little Rock for the same commodity—that would be an illustration of it I presume?

A. It would; I presume, they work it out virtually the same way; I would have to have the rates and work them out as factors before I could testify to the exact result.

Q. Can you see any reason in rate making why Little Rock should not be recognized as a water point as well as New Orleans?

A. I have not been down the Mississippi often enough, but I cannot believe that these are water points; I live at an inland town, Judge Hill, in an inland state, and we people who live away from the water do not feel very friendly towards water competition.

Q. You haven't got any navigation on the Cimeron yet to affect the rates?

A. Yes, we have pleasure boat navigation three weeks in the year, and get hung on the sand bars then.

Q. What is the common method of making state rates—I mean in our southwestern country?

A. You mean by railroads?

2887 Q. What are the rates that prevail in states in the southwestern territory, commission rates or voluntary rates?

A. Most of the states now have a combined commission and legislative and voluntary rates; in Kansas, there are a number of voluntary rates, a number of commission made rates, and a number of legislative rates; in Oklahoma, we have on some lines, Commission made rates, voluntary rates on the same lines; on some articles and on other lines, we have all voluntary rates; Arkansas, I understand, has some court rates and some commission made rates.

Q. They are all merged into the court rate now?

A. Texas has all commission made rates; Missouri has Commission made, partly voluntary, and Mississippi and Louisiana the same.

Q. The evidence in this case shows that all interstate rates are commission made rates.

A. That is due to the commission having adopted the court tariff, I presume.

Q. Those in litigation here are commission made rates; I was asking for the prevailing rates; that has been explained. Now, I will ask you, on what basis is a state rate usully framed?

A. Arbitrary strictly.

Q. Mostly distance rates aren't they?

A. Yes, sir.

2888 Q. Speaking of the classification, what effect does the classification have on the state rates. Do commission and voluntary rates carry exceptions to the Western Classification as well as interstate rates?

A. Some of them do; some of them carry exceptions; some states

in the southwest carry other than the classifications naturally, but all states that adopt the western classification carry exceptions to it.

Q. You have a classificaion system of your own in Oklahoma don't you?

A. No, sir, we carry the western classification.

Q. What do the railroads do?

A. The commission has made no class rates yet, but the railroads have carried the western classification with exceptions, the commission has held a hearing on a proposed order, and I think the rates will be checked in in a very short time, and while I am not giving away any inside secrets or anything, they will be checked in on the western classification with exceptions.

Q. Applicable to the State of Oklahoma?

A. Yes, sir.

Q. It is in evidence that the Arkansas Standard Distance Tariff was based on the western classification, subject to exceptions therein.

A. Yes, sir.

Q. What effect does this variation in the classification that you have just explained, have upon the revenue?

2889 A. It is possible to change the revenue materially by variations in classifications.

Q. In what way; that is clear to your mind as a traffic man, but to the lay mind it would probably require a little explanation of just how it is done.

A. As a sample we will say the first class rate is 40 cents, and the second class is 30 cents; a change was made in the classification, and the exception would reduce it to second class; it would immediately change the rate from first to second, and would make a change in the revenue of the railroad of ten cents a hundred pounds.

Q. What effect does the sum of the locals have upon interstate rates?

A. The sum of the locals have little effect upon interstate rates; the Interstate Commerce Commission have said that where the through rate exceeds the combination of the locals, it would be considered prima facia unreasonable, and they virtually by that, restricted the railroads to the application of the combination of the locals, but it should be further understood in that connection, those rates are supposed to be voluntary rates of railroad companies, long in existence, and the Interstate Commerce Commission have more than once refused to accept as one of those factors a state made rate.

Q. That is, say Oklahoma would make a certain rate, and Arkansas would make a certain rate, this principle would not be ap-

2890 plicable.

A. No, sir, and it is not applicable so far as actual practice is concerned, even now, because I can pick out, and did the other day on the witness stand, where the Sante Fe Railroad charged on interstate business from Kansas City to all points on their lines in Oklahoma—that is, to a large number of points on their lines in Oklahoma, rates that are in excess of the combination of the locals, and it was a fact that was not known by anyone concerned before, and I

suppose it will be corrected by changing the state rate or the intersate rate.

Q. Going back to the question I asked you a moment ago, as to the difference in classification, suppose Oklahoma classes a commodity one way, and Arkansas classes it different, how would you get the sum of the locals.

A. Easily.

Q. You could work that out?

A. Yes, sir.

Q. But it would be a different revenue in each state, owing to the different classification?

A. It would be a different revenue, but the through rate might be affected; it might be lower than the through rate published by the railroad companies.

2891 Q. I want to read you some of the testimony in this case given by Mr. Frank Nay, the Comptroller of the Rock Island Lines. He was discussing the revenue theory of dividing expenses and these are the statements to which I want to call your attention:

"Q. And it will, of course, be inaccurate to the extent that the proper relation does not exist between state and interstate rates?

A. Yes, sir; I think that is true.

Q. And when the rate does not represent the cost of the service it would not be of any value at all, would it?

A. Well, if there was such a rate, no, sir; it would not be. If there was any such rate that did not represent the cost of service at all.

Q. Now, Mr. Nay, does not the rate presuppose it covers the cost of service and a profit also?

A. Surely, I should think it would. As I say, I am not a rate maker, but it would seem that the railroads should have some profit or return upon their investment.

Q. There should be two factors in that rate; one, the cost of the service; and the other, the profit to the railroad company in performing the service?

A. If I were making rates, I think as a novice I would use those two factors. I suppose there are others. There are commercial conditions which necessarily govern; and, of course, the density of traffic, which reduces the cost of the service."

Q. You see from this statement that Mr. Nay says he is not a rate maker and elsewhere he says his knowledge of rates is theo-

2892 retical. He is dealing with the proposition of whether the revenue produced from the rates is a proper measure of the cost, and states that it does not represent the cost of the service, or if there is not a proper relation between state and interstate rates that the revenue basis has no value?

Now, calling your attention to that, I will ask you what is your opinion from your knowledge of the rates, of the relation between the state and the interstate rates.

A. There is no relation whatever between state and interstate rates other than the relation enabling a local jobber to do business.

Q. That is a commercial relation?

A. Entirely.

Q. Elsewhere in this testimony it further appears in Mr. Nay's testimony (pages 354 and 355), in concluding an answer he says: "If they were in exact proportion all the time, the revenue basis would be a perfect basis." That is referring to the two classes of rates, intrastate and interstate.

Then this question was asked:

"Q. And if it represented the cost of the service? You would have to have that also?

A. I presume if they were in proper relation to each other they would represent the relative cost of the service. When I say "in proper relation to each other" I mean in reference to the cost of the service.

Q. Some of these traffic men use that term in an entirely different sense. I think your use of it is correct, but you will see from
2893 the testimony the others use it as having a proper adjustment to the commercial conditions. A just rate of one trade center with another trade center. That is the reason I was particular in calling your attention to it. You mean by it a proper relation of the cost of the service; isn't that right?

A. That is what I had in mind.

Q. That is what you had in mind in your testimony generally, I assume?

A. The proper relation?

Q. The proper relation of cost, you mean?

A. Yes, sir; the proper relation in regard to the cost."

Q. I have read that to call your attention to the two uses of the term "proper relation" in regard to the freight conditions, and "proper relation" in regard to cost, and ask you from your knowledge of the rate situation, where is there relation, if any, between state and interstate rates?

A. There is no relation whatever between state and interstate rates other than a commercial relation which will enable both to do business. But insofar as cost of service is concerned, the basing of rates upon that feature, there is no relation whatever between state and interstate rates and it is impossible to have any relation between them.

Q. Why is it impossible to have any relation between them?

A. Well, the difference in distance is so great that
2894 a rate made on one basis would not apply on the other.

The distance from St. Louis to Oklahoma points—and I prefer answering your questions as to a certain extent, hypothetically and theoretically, as I am to use Oklahoma instead of Arkansas; I prefer to use that as I am thoroughly familiar with those conditions—the rate from St. Louis to an Oklahoma point is predicted upon a haul of about six hundred miles, or somewhere in that neighborhood.

The haul within Oklahoma on a given shipment, like commodity, would approximate fifty miles.

Now, there is no relation directly between the six hundred mile haul and the fifty mile haul. It is impossible to make a direct relation between the two and meet the conditions that have to be met.

If rates could be built entirely upon what we call a scientific mileage scale there would then be the chance to have each shipment pay its pro-rata part of the cost, but in the conditions existing, this freight from St. Louis comes in competition with Atlantic seaboard freight which is handled via Galveston; it comes in competition with German and English made goods handled in trans-state steamers to Galveston, Texas, at a very low rate; practically brought over in cotton seasons as ballast in the boats.

The rates from Galveston are then made to points in Oklahoma.

The same conditions exist in New Orleans. Competition
2895 from St. Louis must meet that from Ft. Smith and that from Texas centers.

The result is that the relation of the rates from St. Louis to Oklahoma do not take into consideration the local rates in Oklahoma, but the rates from the surrounding States and Territory that supply Oklahoma with the same commodities that the St. Louis rates apply to.

Q. That is sort of a trade balance?

A. Absolutely so; a necessary condition in order to market the product.

Q. Take an illustration and see if I get your idea clearly: you are familiar with the Arkansas Standard Distance Tariff?

A. I am.

Q. Take the lumber schedule that moves on a mileage distance rate, I believe, with a rough material rate into the saw mill:

Compare the rate for lumber moving from a saw mill in Southern Arkansas, moving first into a saw mill, probably from some tap line; then manufactured into lumber at the saw mill and shipped out to Little Rock Fort Smith, or any other intrastate point:

Compare that movement with a similar movement of lumber shipped from Lake Charles, La., on a twenty-three-cent-rate to Omaha:

What relation would there be between the revenue in the
2896 lumber shipment under the Arkansas Standard Distance Tariff and the relation of the revenue derived under this interstate tariff in that zone?

A. It is impossible to make a comparison. There is no comparison there.

Q. Mr. Nay says that unless there is a proper relation based on the cost of the service between the two, the revenue theory would be of no value.

A. There is no possible chance to make a comparison between those two rates. They are not related to one another in any way. One does not depend upon the other. One is not taken into consideration in making the other. They are as unlike as black and white and no comparison can be drawn between them. A man would be foolish to try to draw a comparison between two sets of rates, because no two factors are entering into the rate that are the same except the proposition of the railroad handling the business.

The rate from Louisiana points to Omaha and all intermediate points, is twenty odd cents. At which point are you going to take

it to compare it with the Arkansas rate to find the comparison? There are no two things entering into it that are comparable.

Q. Suppose we get something that can be compared:

It is in evidence here that lumber shipped from points in Northern Louisiana to St. Louis would carry an eighteen cent rate,
2897 but if that were shipped from the same point into Little Rock, it would carry a twenty two cent rate, going over the same track, originating at the same place, part company at Little Rock, get a twenty two cent rate for the haul to Little Rock and eighteen cents for the haul to St. Louis; and a similar shipment that happened to be within the State, the same length of haul, would have still a different rate fixed by the Standard Distance Tariff:

What relation would you figure out existed there?

A. I have worked rates a long time, but I fail to be able to find any relation between those rates. There is a competitive condition, Judge, that creates that eighteen cent rate at St. Louis, which the railroad sees fit to meet. That was years ago. I understand from traffic men that it does not exist today, but the rate exists, and that competitive condition that did exist caused that eighteen cent rate from Arkansas and twenty two cent rate from Texas and Louisiana fields into St. Louis. There was not any state rate in Arkansas or Oklahoma that had anything to do with the making of that freight rate, and when they came along to make the Oklahoma and Arkansas rates I do not think they took that rate into consideration.

We find in Oklahoma, in some instances, there are six cents difference between the local rate in Oklahoma, between two given points, and the rate from Texas to that point.

2898 In one place there would be eight cents and in another place there would be ten cents. There was no reason for any of that. There was not any mileage condition that could possibly bring around the exact differences or anywhere in the neighborhood of the differences, and I fail to see where a man can draw a comparison between a state rate and an interstate rate and say they are related to one another, and when built upon the other, there is a condition under which a man could compare a state rate and interstate rate, possibly, on a revenue basis, to see if one was paying its pro-rata part of the cost as compared with the other.

Q. What would that be?

A. The traffic moving interstate on each different commodity would have to be of the same proportion as the traffic moved in the state on the same commodity and then the rates would have to be so far apart as was found the difference between handling state traffic and interstate traffic and if each rate was built upon that exact factor then a man could take the revenue theory and so on that basis could be divided the expense, but I know of no other conditions under which the revenue theory could be taken.

Q. That is a condition that does not seem to be existent, as gathered from your testimony.

A. It not only does not exist, but it is impossible for it to exist.

Q. Let us see if I quite follow you: suppose you take
2899 lumber: to make the revenue basis fair there would have to be the same proportion of lumber moved in the State business as in the interstate business?

A. Exactly.

Q. And in addition to that, there would have to be the same rate per ton per mile?

A. Plus the extra cost.

Q. To start with, you would have to have the same rate and then you would have to take care of the extra cost of short haul?

A. That is it exactly.

Q. Then, would you not have still another factor to take care of?

A. What is that?

Q. The profit the road is entitled to make on both classes of the shipment, in addition to the cost of service?

A. That would be taken into consideration, too.

Q. You are assuming that the profit is included in the rate?

A. Absolutely.

Q. Without that condition existing, then, you would be very much like Mr. Nay; you would think the revenue theory had not much value?

A. It would have no value at all. There is no condition in which it can have any value as between state and interstate rates.

2900 Q. I handed you a few moments ago a statement to read, from Mr. Nay, about the relation that existed in the classification between state and interstate.

A. Yes.

Q. Do you remember it?

A. Yes.

Q. I wish you would state the substance of the statement as he understood it and the way you understand the facts to be. I will look up the page and hand it to you.

A. While you are looking for that, I will show you a difference between state and interstate rates:

The rate from St. Louis to Mulhall, a distance of approximately 590 miles, is $1.30 on first class. This yields something over twenty two mills.

The rate from St. Louis to Oklahoma City, approximately 640 miles, has a rate of $1.30 also. This yields approximately twenty mills.

Now, I do not see any possible way to compare a state rate with one or the other of those, and if you are going to compare it, which one you should accept to say the interstate rate is built with—on the one they get two mills per ton per mile more than they do on the other, and I fail to see where the factor comes in that can be compared.

Q. Here is the statement (page 360):

2901 "Q. You understand the state rates certainly in Arkansas and probably in many other states, are fixed by the Commission; so the railroads do not get a guess at them. So you must interpret Mr. Johnson's testimony here as referring to interstate rates?

A. Yes, but by examination of the two I find that practically the same relative cost of first, second and third classes in car loads exist with the Commission as with the interstate rates.

Q. You differ with lots of these witnesses, like Mr. Watson, very much, Mr. Nay.

A. His judgment is better than mine. I say practically the same. I have not compared individual rates. But what I mean, Judge Hill, is to say, for example, here is an Arkansas rate, a rate for first class 50% more than the rate for fourth class. In the interstate rate tariff the rate for first class is double the rate for fourth class.

What I mean is that they have preserved a relation and fixed a higher charge for the commodities that are classed as first-class in this classification than they have for those fixed as fourth class.

Q. That is following out the classification. And I suppose they run along general lines with not much difference. But Mr. Watson in our last hearing took a great many instances of the leading commodities in the State and pointed out where there was an improper relation between state and interstate rates."

That is the point I want to call your attention to, as to whether as a practical matter, not as a theoretical one, whether this relative cost between first, second and third class exists between interstate rates and Commission rates.

A. I do not think they do. The rate from St. Louis to Little Rock, the fourth class rate, is forty five per cent of the first class rate.

What I understand is the average haul in Arkansas on
2902 state rates, the Standard Distance Tariff shows that the fourth class rate is 66.6 of the first class rate. In other words there is 21.6 per cent variation between the two.

Q. That is the percentage of the relation between the two?

A. Exactly.

Q. It is just another factor in addition to the fluctuation in the rates that reaches to the revenue.

A. Exactly.

Q. You do not find Mr. Nay's theoretical illustration in practice?

A. No, I have worked it down to every possible point in the voluntary rates of the railroads in Oklahoma and the voluntary interstate rates of the roads, and there is not a single instance I have ever found that they were the same.

I went into that theory to try to find out if they were built upon such a basis.

The Chicago-Guthrie rate is 58 per cent, fourth class of first; the Oklahoma rate on the Santa Fe is 53.44 per cent.

Q. Is that a voluntary rate?

A. Both are voluntary rates. I do not see where any adjustment comes in.

The Chicago-Missouri rate—I will call fourth as against
2903 first, as that seems to be the one Mr. Nay took up—that is forty per cent; Chicago-Guthrie rate is 58 per cent; St. Louis-Kansas City rate is 45 per cent; St. Louis-Guthrie rate is 63 per cent; the Kansas City-Guthrie rate is 65.3 per cent.

The percentage of class rates from Chicago to the Mississippi River and Missouri River to Colorado common points I find the average is 51.2 per cent.

Now, in all of those there is absolutely no comparison whatever, so I fail to see—none of those rates will compare with the local rates as assessed in Oklahoma, and I do not see where the comparison comes in as he has it, 50 to 50.

Q. That kind of rate making is right square up against the Western classification?

A. It is just as I understood Mr. Johnson, of the Cotton Belt, testified before the Interstate Commerce Commission, that the rates in Oklahoma and Arkansas had been made in a hap-hazard way and were never straightened out.

Q. Let us see if I can find what we have here—this is Mr. Johnson of the Iron Mountain, traffic man—J. M. Johnson.

A. I was talking about S. C. Johnson.

Q. This is another Mr. Johnson. He says:

2904 "But in making rates is the general average of cost of moving the commodity taken into consideration in fixing a rate that will be compensatory in the moving of any particular commodity? I refer to the general average of cost you have spoken of, as shown by your records at the end of the year.

A. No, sir, rates are not made that way. By experience we have some knowledge of about what we ought to have for the service in question, but rate making as a general proposition is largely a guess and the railroad people claim that by experience they are much better able to guess correctly than the other fellows. There are so many factors entering into the cost that it is impossible to determine the cost of moving the different classes of freight. And we can only determine in a general way, from experience, about what is fair and compensatory."

2905 Mr. MOORE: I object to the statement of counsel that this is the testimony of Mr. Johnson in this case.

Mr. HILL: It is not the testimony given by Mr. Johnson in this case, but it is the testimony of Mr. Johnson in another case.

Mr. MOORE: Brought in here by hearsay.

Mr. HILL: I am not asking how it was brought in here. I am asking what is his opinion of the rate situation?

A. To a large extent it is true.

I don't think, Mr. Hill, that a traffic manager or a general freight agent making the freight rate, ever looks at the cost of service.

If at the end of the year the financial reports showed that the railroad was losing money and he was instructed to get more money than he did, the chances are, 99 out of 100, that the rates that would pay the increase would not be the low commodity rates. He would go after the rates that could stand it. He would be afraid to tax it on to the other rates because that would put them out of business entirely.

Q. That would be good railroad business?

A. That would be sound logic.

Q. That might change the relation between state and interstate that Mr. Nay speaks of?

A. I don't think it exists, so you can't change it any.

2906 Q. Now, Mr. Bee, from your knowledge and information of how revenues are derived by the railroads from the two classes of traffic, state and interstate, I wish you would state your opinion of using those revenues as a measure to divide the costs of the service, state and interstate.

A. I think it is more than unfair to take the revenue basis to divide the cost of service, because the revenue basis within itself has already added to the state business—the rates have already added to the state business an added charge. They include within themselves an extra cost for doing business, and this can well be shown by the comparisons that I got from the railroad's exhibit 26—I believe that is Mr. McPherson's.

Q. No, that is Mr. Johnson's.

A. On less-than-carload freight, leaving out trans-state entirely, it shows that 20,573 tons were handled, interstate; 8,031 tons were handled, state.

Using the factor suggested by Mr. McPherson in his testimony, of five tons per car, of less-than-carload freight, this will give 4,134 cars moving an average distance of 109.53 miles for interstate business, and 1,602 cars moving an average distance of 57.18 miles for intrastate business.

It is shown that the car mileage of state business is 16.8 per cent of the whole. (I am entirely disregarding trans-state business compilations.)

2907 The revenue received from these two classes of freight was about 30 per cent, for the state business. Now, although it performed 16.8 per cent of the actual car mileage of the two classes of freight, it paid 30 per cent of the revenue, and to divide the expense upon that basis you are going to make this 16.8 per cent of the freight, the actual car mileage, pay 30 per cent of the expenses.

If you will take the excess mileage of these interstate cars, as compared with the state cars, we find that the excess is 361,305 car miles, and this, at the Missouri Pacific rate for empty cars, of ten cents a mile, would give $36,130.50, if these cars had been handled empty. For new cars going somewhere else they would receive for that service $36,130.50, or more revenue than the state business brought in. That is merely the excess of empty car mileage over the state car mileage.

Further than this, the average revenue received from this interstate business was 33.230 mills.

The average haul of state business was 57.18 miles.

This secured for the railroad companies, on the interstate business moving the same distance that the state business did, a revenue of $1.90 per ton.

From state business moving the same distance, they received 67.275 mills, or $4.84 per ton, showing an excess that state

2908 freight paid over interstate freight, moving right along the same distance, of $2.94 per ton, which would take care of all the extra cost of state business and leave a whole lot besides.

Q. These gentlemen that testified here, talked about this less-than-carload business being the most expensive business the railroads handle?

A. There is no doubt about it being the most expensive business—not the state less-than-carload, but the less-than-carload business is without a doubt the most expensive business a railroad ever handles, and it realizes less profit on that in the long run than it does on any of the business. But when you take into consideration that every time a pound of state less-than-carload business is delivered there are two pounds interstate less-than-carload handled along with it, and under the same conditions.

If all less-than-carload business, interstate, was handled from St. Louis to Little Rock, the conditions might be different, but if you will take a shipment destined from St. Louis to the first station north or south of Little Rock, on the Iron Mountain, or Fort Smith or any other point you please (outside of a terminal point), you will find that that business is brught into Little Rock in what is called a "package car" and is there unloaded and checked into another car, and proceeds out the same as does a state shipment.

2909 It not only receives the same service at Little Rock that the state shipment receives, with the exception of making out way-bills, but it has received in addition the service of unloading it from the car it came in.

I have checked these things time and time again—not in the state of Arkansas, of course, but in other states; in Oklahoma, Missouri and some in Kansas, but most of my investigations have been in Oklahoma, and I have found that trains proceeding northward from the heart of Oklahoma carry more freight in their local peddling trains, which originated at points north of Oklahoma, than they do of freight that originated in Oklahoma. It has simply been brought there in a solid car, split up and then going back for distribution, making a back-haul and receiving exactly the same service that the state less-than-carload is receiving, with the exception of making out the way-bill at the original Oklahoma point, but to counteract that they have unloaded that freight and checked it at that station.

Q. Which would be a heavier expense?

A. More liability and more work attached to it.

Q. The substance of that is, that while this class of freight, less-than-carload, is the most expensive to handle, this revenue derived under the state less-than-carload is 30 per cent greater?

A. It is more than that. It is thirty per cent for the entire run as compared to 16 per cent for the entire tonnage.

2910 Q. I want the rate per ton per mile.

A. It is almost double, 33.230 against 67.275.

Q. In round figures, they have got double the amount of revenue for the state less-than-carload that they have for the interstate less-than-carload?

A. Yes, sir; per ton per mile.

Q. Now let us come to the carloads: is there any difference in the

cost of them, any such difference that you have got to divide it on the revenue theory and then add 200, 300 or 400%?

A. There is a very slight difference in the cost of handling the business. Of course there is a larger per cent of state business handled on local trains than there is interstate business handled on local trains, but there is not a larger per cent of the local train that is state business than is interstate business. One often makes the statement, without intentionally deceiving those who are sitting around and listening and interested, that the percentage of state freight exceeds the percentage of interstate freight. So it does, as to the whole, but it does not exceed that part which is loaded on the local train, and that is the only thing that figures in the expense of that local train which is without a doubt the most expensive train run over the road.

Q. How much of the switching is done for the through train by the local train?

2911 A. Virtually all of it. All cotton is picked up and carried to a division point, at least. The through train sets out cars at a terminal point and the local train takes them out to their destination.

The local train sets the empties for the grain and for all of that movement and brings it back into the terminal and gives it to the other train. But for a local train it would be impossible to run through trains. There is no question about that. They might run through trains in Arkansas—in Missouri, without a local train in Missouri, but if they did they would have to have them in Arkansas. They might cut them out of one state, but they could not operate through freight trains unless they had local freight trains.

Q. I will call your attention to another matter that is in evidence and ask you if you know anything about that: that is the lumber traffic:

It is in evidence here that logs are hauled to a sawmill in the local train. They are to be manufactured and shipped out to St. Louis and outside of the state. They are carried sometimes to the nearest division point on local trains, and sometimes on the local train directly to the saw-mill point: are you familiar with that situation?

A. I am. The through train handles nothing except freight that originates for it at big towns, unless in exceptional instances if there is a carload of perishable merchandise for some

2912 small jerk-away station. The through train may get instructions to stop there and get that; it has been set out—what we call "first out" at the end of the track; they have to make one cut; they pick it up and then go ahead. That, however, is exceptional.

The local train is supposed to clear up its division and get everything into the terminal, north or south or west, whatever direction.

Q. The local train is clearing up the way for the through train to go out without any interruption?

A. Yes, the local train lays on the side until the through train gets through. The through train has a time-card right which the local train has to regard and has to observe. She starts from one station

to another and finds a little more work at a siding than she expected; her time is up; she cannot make the next station. The result is she goes into a "hole" and stays there for one, two or three hours, waiting for the through train to come along, sometimes having a man walk to the next station to telegraph——

Q. It is sort of a "beast of burden"?

A. Yes, and it is the one that you can never put the last straw on the camel's back and break it.

Q. Is it serving state and interstate, both?

A. So inseparably that you cannot find it.

Q. I would infer from some of this testimony that it did not serve the interstate?

2913 A. The man who testified to that either did not know or was not fair.

Q. Of course he was fair. He was going on a theory, probably.

A. A man who has ridden in local freight trains knows the work that they have to perform.

Q. Now, Mr. Bee, have you made any examination of this trans-state proposition?

A. I have gone into it thoroughly.

Q. I want to call your attention to the fact that in this case the tons per mile of trans-state, on the Iron Mountain, is fifty one and some fraction; the tons about thirty three per cent of their traffic. The Cotton Belt is a little higher, forty four in tons and about sixty four in ton miles:

Some of these gentlemen have thought that that trans-state business went through the State like it was on a bridge. Occasionally they would strike a pier and change an engine and caboose, but the train stood out there on the main track—or maybe took a siding while they changed the engine and caboose and shifted on through, and that was the way that trans-state traffic was conducted. They say it did not use a great many of the facilities the other traffic used and that it was the least expensive of all the freight handled, and was very profitable and remunerative.

2914 I will ask you if you have made any study of that condition of affairs.

A. I have.

Q. I wish you would state what you found in it.

A. I found in practice that the trans-state trains are seldom run. There are few roads that can afford to run those trains that are known as exclusive trans-state trains.

A train will start out of St. Louis or Kansas City or some other point, with all of the red ball freight—that being the highest class of freight a railroad handles—that there is in the yard. If there is not enough there in the yard to make out a red ball train, they put in green ball, and anything else to make up their tonnage. They proceed South until they come to a point where there are some more cars of red ball freight. They immediately reduce by putting out their green ball, or common freight, and set in the red ball. This continues all the way along the line. Every time they find a car of red ball they reduce a car of green ball, or common freight, and

take in the red ball freight, with the desire to expedite that movement as much as possible.

Q. Is it at division terminals where that change takes place?

A. Mostly division terminals, but it will be done any-
2915 where else that they find it. If it is freight that has to move they will stop and take it out.

I presume trains going into Little Rock would carry a solid red ball train, that is, I presume a solid red ball train could go into Little Rock which would have fifty or sixty percent of its tonnage for Texas and the rest would divide up and go somewhere else, with the result that other cars would be put into that train. Even if a trans-state train was run through it would necessarily require that prior to its arrival the division terminal of the main line be cleared or left open at least ten, and maybe twenty or thirty minutes before its arrival. The switching engine goes on its way. It has gone to the yard to get the caboose; cleared another track somewhere else for the extra engine to run up on. The change of engines is made. The switch engine must then take the caboose and put it away. The other engine must be put in the round house—using the facilities of the terminal all the time.

Q. What about inspection?

A. The train lays on the main line as a rule, or on a passing track, while it is being inspected as to the boxes on the train, to see if it is properly oiled, if the packing and the journals are good, and everything is delayed in the yard while that through train is standing there. I have often seen where they were delayed one hour or an hour and a half in the yard and everything was tied up.

2916 Q. Suppose the inspection would develop that it was a bad order?

A. The car would be cut out, set on some side track and the train made up again and proceed on its way. Or maybe it would be something that could be fixed and they would jack the car up and change a journal, or something of that kind.

Q. We had in evidence here from a gentleman in Little Rock who had been a switchman down there for a good many years, who testified that such a train went through there in the five years he worked there—an onion train from Texas that went North. That was the only one he knew of that went through on a bridge.

Would what you have testified to be applicable to the onion train?

A. Absolutely, that onion train would receive that service.

Q. If there happened to be a car in that onion train that was out of order the whole train would be broken up for switching purposes?

A. To set that one bad car out.

There are other trans-state conditions that come in there of what would be trans-state freight. The Fort Smith & Western operates out of Ft. Smith to points in Oklahoma and does a very good business.

The Midland Valley operates from Ft. Smith and likewise does a good business.

2917 Both of these railroads depend entirely upon some trunk line to give them their local business. Their local business from point to point on the line would not be near sufficient to sustain them. It would not start to sustain them. The natural result is that the Santa Fe, having a line parallel them at numerous points; the Rock Island and Frisco also, and the Katy, are not so anxious to make divisions with them as are the lines that do not parallel or meet them at competitive points.

The Kansas City Southern, St. Louis, Iron Mountain are two lines that do meet them at Ft. Smith and who do have joint arrangements with them on traffic from Kansas City and other points. Now, this traffic is all trans-state traffic. It originates in Missouri and Kansas and is destined in Oklahoma, but every bit of that traffic is handled through the terminals at Ft. Smith or some other points.

In the Southern part of the State I understand the Missouri Pacific secures a lot of lumber which is brought up into the State, transferred to other lines and goes away. The same condition exists at Memphis—for the purpose of this case I understand Memphis is included in Arkansas.

Q. That is right.

A. And all of these conditions bear burdens upon trans-state traffic.

Cotton originates in Oklahoma; is brought to Ft. Smith is compressed and goes out on the Missouri Pacific.

2918 Cotton seed meal, hulls, originate along the Midland Valley and Ft. Smith & Western up into Ft. Smith and go North and South via the Missouri Pacific and other lines.

All of this freight is trans-state, but it all uses the terminals at Ft. Smith or at the junction point wherever it is delivered to the connecting lines.

I notice Mr. McPherson said in his testimony that no trans-state express was handled in Arkansas, that it was merely overhead and went through. The same condition exists on trans-state express as exists on others.

Q. Let us illustrate that Ft. Smith & Western situation there: Take some point on that, that had a shipment through to Boston: What would be the logical line for that to go, say cotton?

A. Well, if the Missouri Pacific get there and hustle that traffic the natural result is if the soliciting agent can secure it it is going to come into Ft. Smith and routed North via the Missouri Pacific.

Q. Compressed at Ft. Smith and carried on to Boston over the lines of the Iron Mountain and connecting carriers?

A. And its connecting carriers.

Q. What is the practice about scaling or weighing?

A. There is a feature that will come in on trans-state

2919 business. The rules of the railroad company are that all freight should be scaled at the first track scales. In business that originates in Kansas or Missouri, going into Arkansas;

originating in Texas or Louisiana going through Arkansas, which originates North or South as the case may be, coming from Louisiana, Texas or Kansas and Missouri, would be weighed at the first scale in the State.

Q. Now, to illustrate that: there is a large lumber movement from Northern Louisiana, North of Monroe; it passes on to interstate points in trans-state movement and is scaled at Dermott or McGehee —Dermott would be the first scale: there is quite a tonnage North of Monroe:

What handling would that trans-state lumber get?

A. On account of its location, I imagine McGehee would scale most of that lumber, which would be scaled in Arkansas. The rules are to scale at the first scale track.

Q. I think there is a large cotton movement from Northern Louisiana down there, very considerable, that the compresses at McDermott—or McGehee would be the first compress point——

A. They would not scale cotton.

Q. I am talking about compression.

A. That would depend on the traffic arrangements, but it would be compressed at the first compress.

Q. The usual rule is to compress at the first point, is it not?

2920 A. At the first point unless there is some exceptional condition.

Q. There seems to be some use, then, in trans-state business of State facilities, rather than going over on a bridge, as you have found it?

A. Yes, and I have found that the trans-state trains are very heavy users of terminal facilities within the State, very often. I have watched it very carefully.

Q. Now, passing to such trains as you spoke of, like Mr. McCutcheon told about in regard to the onion train: what is the usual way that that trans-state train there is handled?

A. There is another expense that comes in. If Arkansas destined all of their own freight that came in there—there was no trans-state—if everything has its destination within Arkansas it would be unnecessary to have the large terminals they have and to have the long passing tracks that they necessarily do have. There would be numerous operators who would not be maintained for night service, and incidental expense of that kind that would not be borne except for trans-state trains.

The trans-state freight is—the through freight is the long freight. It is the freight that is carrying the most business and the result is that it uses the long track for passing. They have got to have longer tracks in order to pass than if simply handling local trains, in order to allow these trains to pass without serious delay.

2921 They keep telegraph operators at closer points.

Q. Do they ever put out passenger trains too?

A. Sometimes they do, but not as a rule. That is an exception when the passenger goes in the "hole" for the freight train.

Q. What about these night operators? Do they run the local trains at night?

A. Not unless they have over-time work; those are exceptions.

Q. Before we get away from that Ft. Smith situation; I suppose you are familiar with the fact that Ft. Smith is a large furniture manufacturing center?

A. I understand it is. I understand a lot of lumber goes there that is sawed up and made into wagons, and wagon material, and brought back.

Q. What about other shipments, say to Tennessee or Alabama, or lumber that originated in Oklahoma?

A. It would be trans-state originating in Eastern Oklahoma.

Q. That can be done under rough material rates?

A. Yes, they do that under milling-in-transit rates, I think. I understand they have some in effect. I don't know the extent of them.

Q. Are you familiar with the oil movement, Mr. Bee?

2922 A. Generally speaking, yes, sir.

Q. How is oil usually handled?

A. Oil is a commodity which is handled peculiarly. Certain days in the week are specified as "oil days" and on those days the railroads move what is called oil cars. That is to prevent damage to other freight by forcing them to handle oil and loading it in the same car with vegetables. I have heard some statements that the smell of the oil would permeate sacks of flour and such things as that and absolutely ruin them. It would get up against the dry goods, run through the boxes and ruin the silk and dry goods. For that reason the Commissions in most States have permitted the railroads to designate certain days in each week on which oil trains should move and not force them to move it on other days.

Q. It seems in Arkansas they are complaining about being required to move it certain days.

A. I don't see where their complaint comes in. It would be a penalty upon them if they were forced to move it every day. It would not be a penalty, but if the Commission grants them certain days in which they can ship it, they are doing the railroads a favor and are avoiding the danger of ruining other traffic. If they should be forced to furnish their own equipment——

Q. I am not speaking of oil trains.

A. Well, they call them oil trains; they are oil cars.

2923 Q. I suppose you have a much heavier oil movement in Oklahoma than we have in Arkansas?

A. They speak of them as oil trains. They are not. They mean the days on which oil should be carried. There is no such thing as "oil trains," except the trains carrying fuel oil, to the refineries or places of that kind, to the places of consumption.

Q. What is the difference in the terminal handling between one of these through trains and a local train?

A. At the terminal?

Q. Yes.

A. Why, the difference is simply this: that the local train when

it comes in has already done its switching; its cars are all made up in order, and when the switching engine in the yard gets hold of a local, all it has to do is to cut the cars out. They are already in order—the red ball in one place, the green ball and other freight all broken up. That is the requirement that the local train shall bring its cars in in that way; while a through car comes in in the condition as it leaves the previous point. It is generally made up at the previous division or terminal point—and as near that condition as possible, but the services are virtually the same. They have the distributing of these cars around the different tracks, set
2924 them out and fill them to make a new train; set them away for the next morning; take them around to the different industry tracks.

I should say that a through train going into a town like Little Rock, setting out its entire train, and a local train going into a town of that size, the through train would have three times as much work on it as a local train would, because more cars would be destined to Little Rock and more to be delivered.

Q. After considering all of those various phases of this question, I wish you would state your opinion as to what, if any, is the extra cost of doing state over interstate business.

A. That is a hard problem to answer, Judge Hill. I have tried to come to some positive decision on that basis. The main factor in state business over interstate business, that I have been able to find, is one additional terminal expense.

Q. Take that condition in Arkansas, about the cotton, lumber and grain we were speaking of this morning, where there were so many extra handlings of the interstate freight:

A. That would more than offset it.

Q. There is another proposition in this case—I don't know whether or not your attention has been called to it—about Fort Smith and Memphis being interstate points and all of that traffic carried as interstate shipments?

A. That creates a lot of traffic that has double the service in the state, and possibly Memphis and Fort Smith would handle as
2925 much traffic to points in the state of Arkansas as would the entire state, with the exception of Pine Bluff and Little Rock. Take those out of the state for interstate shipments, and the business from Fort Smith and Memphis would possibly equal all the rest of the business.

Q. Taking the general survey of the situation—

A. I mean less than carload business.

Q. —what would you say of the fairness of dividing the expense between state and interstate traffic in the state of Arkansas on the basis of the revenue received from each class of traffic, and of the revenue on the interstate being apportioned to Arkansas on a mileage pro rata—on the ratio of the main line mileage of the Iron Mountain?

A. I would say that the railroads were getting more than what they were entitled to.

Q. You are referring to the revenue without any extra cost?

A. Absolutely.

Q. Why do you think they would be getting more than they are entitled to?

A. Because right there, in the example that I worked out, they are getting $2.94 a ton more revenue from state than interstate freight, the only additional service being one terminal; while their entire revenue from interstate freight terminating in Arkansas is but $1.90, and they are receiving an additional here of $1.04
2926 more for the extra terminal than they got for the entire handling of the other shipments.

Q. I believe that example was on the less than carload?

A. Yes, sir.

Q. I want to give you approximately the figures here: on the revenue per ton per mile, 12 mills for state and 6 mills for interstate.

A. The same conditions would work out. It is two to one, the same as this other.

Q. Those are not exact. I am using round figures on it: that would more than take care of any extra cost, as I infer from your testimony?

A. It would.

Q. Now, if you divide the expense in proportion to the revenue, you apportion double the expense to start with: is not that a fact?

A. That is a fact.

Q. That would be more than doubling it after you have already taken care of that expense in that rate?

A. Yes, sir.

Q. I want to call your attention to a situation that is in evidence here by the railroad accountants:

After the injunction was obtained in this case and the railroad went out of the business of fixing rates, the railroads readjusted their rates, both state and interstate.

2927 The third month following their free hand in this, it was shown that the Cotton Belt—in the month of January 1909—increased their interstate revenue nine and a fraction per cent, and their interstate revenue ninety-six and a fraction per cent, per ton per mile:

If a calculation was then made as to the amount of expense that would be apportioned to the state, where would it leave the state of Arkansas?

A. If it was continued on indefinitely, the intrastate business would soon pay the total expenses of the road, on a revenue basis.

Q. What do you think about this relation or "parity" as some of them called it, between the state and interstate rate? When they had a free hand they increased their interstate rates 9 per cent and their state rates 96 per cent.

A. I think that is just as much of a parity as ever existed between state and interstate rates.

Q. I said "rates": it was the revenue?

A. I think that is just as much of a parity as ever existed in rates, and any man who tries to create that parity between the two is going to get himself where he cannot get out.

Q. It is not there?

A. It is not there. It is impossible.

2928 I want to add there that the traffic men themselves say, the longer you haul the shipment the cheaper you can handle it per ton per mile. That is a misunderstanding. I don't think any traffic man will go on the stand and say you can haul a shipment 200 miles cheaper the second hundred than the first hundred. But the fact is that by reducing the rate per ton per mile, you are still paying your terminal expense, and the cost of the haul just the same, 100, 200, or 300, with the exception of the terminal expense; and of course the longer you have to go you can exact a smaller fraction on each mile to pay that terminal expense with, and that is the only reason that I know of why it costs less to handle the shipment a long distance than a short distance. After a shipment goes over one terminal or one division, it costs just as much to handle it——

Q. You mean the cost per ton per mile?

A. Yes, or the cost as a whole; any way you want it. The terminal expense at origin and destination has to be taken care of, and if you can haul that shipment 500 miles you can take a less figure on each mile to pay those two terminal expenses, than if you are going to haul it only 100 miles. The actual cost of transportation is just the same, if the condition of the road is the same.

Q. Suppose this factor enters into it: suppose the longer the haul, the more intermediate carriers?

A. That is largely true.

Q. And the rate is thinned out by every division?

2929 A. It continues to thin all the time. A shipment passing through interstate from road to road will stand a heavier terminal expense, right here in Kansas City than it would cost to be delivered in Oklahoma. I understand that the expense there has been figured out at $4.80 or about that.

Q. Do you refer to St. Louis or Kansas City?

A. I meant Kansas City, $4.80 there, from line to line. They have never contended it cost over $2.60 to deliver freight in Oklahoma, at our largest and most expensive terminal we have.

2930 Cross-examination of Mr. BEE.

By Mr. MOORE:

Q. What is your age, Mr Bee.

A. Past 30; something over that.

Q. Do you mean it is under 31.

A. Yes, sir.

Q. I beileve that you stated that your first connection with railroad work was as stenographer to the Superintendent?

A. Yes, sir.

Q. What road was that?

A. The Mexican Central. All of my railroad experience was on the Mexican Central.

Q. Where is that located?

A. It runs from El Paso, Texas, to the city of Mexico; from Irapuato to Guadalajara, which branches from Torreon to Saltillo.

Q. It will not be necessary for you to go into those details. It is a Mexican railroad?

A. Yes, sir.

Q. How old were you when you went into the service of the superintendent of that road?

2931 A. Less than twenty.

Q. That was about ten years ago, then?

A. Eleven years ago.

Q. Who was the superintendent, Mr. Bee?

A. Mr. E. S. Banks, was the first one.

Q. What was his position?

A. Superintendent.

Q. General Superintendent?

A. No, superintendent; division superintendent.

Q. How long did you work with him in that capacity?

A. I think I was in with Mr. Banks three or four months and then I went to Mr. Ben Collins.

Q. Who is Mr. Collins?

A. Division superintendent also.

Q. Did he succeed Mr. Banks?

A. On another division.

Q. How long were you with Mr. Collins?

A. Something over eight or nine months.

Q. What was your next service after that?

A. With Mr. Jennings, the assistant superintendent of machinery.

Q. And what was your position with him?

A. I was first in the office as his private secretary and next I had charge of what was known as "1315 reports"—delays on the road. And from that I had charge of the work in the shop,

2932 checking engines into the front shop or back shop; taking the engineers' reports and designating the work to be done on them and issuing orders for supplies and material; checking the work nightly to see it was being gotten out.

Then I was in the office as his chief clerk for probably 2½ months.

Q. Were you acting as Stenographer during that period also?

A. Only for about the first six weeks.

Q. What did you say was the name of that party?

A. Mr. Jennings.

Q. I don't recall what position you said he held?

A. Assistant Superintendent of Machinery.

Q. Where was his——

A. Mexico City.

Q. What were the duties you performed for him?

A. I was his secretary.

Q. I suppose that was to attend to his correspondence. How long did those duties continue?

A. I think I was doing his actual work about six weeks, if I remember correctly.

Q. Then what was the change?
A. I went there and took the 1315 reports.
Q. What are they?
A. The delay reports.
Q. Delay of what?
A. Delay of engines on the road.
2933 Q. What did you have to do with it?
A. I had to take those reports up and see what the delay was, going to the transportation department to see what the conductors reported was the cause of the delay on those particular trains, and investigate the general cause of the delay. If I thought the delay was too great, I would take it up with the engineers personally and demerit them for the delays—and such work of that nature.
Q. To whom did you report?
A. I reported direct to the general manager, in Mr. Jennings' name. Everything from the department was reported in his name.
Q. How long were you engaged in those duties?
A. If I remember right, three or four months.
Q. What was the next duty assumed by you?
A. I then had charge of the shop work.
Q. Were you still with him?
A. Still with him all this time.
Q. What were your duties in connection with the shop work?
A. As I stated, checking engines in and out of the shop; taking engineers' reports of the work that had to be done on them; making orders out to the shop; drawing the necessary material.
Q. That was checking engines in and out for repairs?
2934 A. Yes, sir.
Q. How long were you engaged in that work?
A. I don't remember those months exactly, Judge. I would say about the same time as on the 1315 reports.
Q. About three months?
A. Three or four months, I should judge.
Q. What were your next duties?
A. I was with Mr. Jennings entirely, doing whatever he wanted me to do. Most of that time was spent in checking the power on each branch of each division; seeing that there was sufficient power on one division to move the business given us by another division——
Q. Mr. Jennings was division superintendent?
A. No; assistant superintendent of machinery. He had charge of all the territory north of the half line—I won't mention those Mexican names because they will confuse the record; the superintendent of machiney had charge of the line north of that—Aguas Celientes——
Q. Is that the time to which you referred when you said you were acting as handy man for the superintendent?
A. Yes, sir.
Q. That is, assistant superintendent of machinery?
A. Yes, sir.

Q. Where were you located at that time?

A. Our headquarters were in Mexico City. We were
2935 there about just a fraction of the time at the different shops and on the road all over.

Q. What were your duties at the shops at each place?

A. I was just into the shops and out of the shop, taking the power into and out of the shop.

Q. You mean checking engines?

A. Yes, and their capacity and the standard at which they were working. If an engine was rated at full standard and I found on checking it up that she was doing only $\frac{2}{3}$ of the work rated——

Q. What did you do with that information after you had it?

A. It was merely to check the engines back and forwards.

Q. That was reported to some one?

A. No, it was simply to change the engines, that would be the result of that. It was reported to him, of course, all information reported to Mr. Jennings.

Q. And any change that was made, was made to orders given by Mr. Jennings, I suppose?

A. Oh, sure.

Q. You were acting in the capacity, we might say, of a clerk or a sub-ordinate of Mr. Jennings?

A. Absolutely.

Q. What were your duties on the road?

A. The same thing.

2936 Q. How long were you engaged in the discharge of those duties?

A. I was with Mr. Jennings something over a year and the balance of the time was in that work.

Q. Then what was your duty?

A I then went to the traffic department.

Q. Whom were you employed by there?

A. Mr. T. F. Ryan.

Q. What was his position?

A. I was in the office as his secretary.

Q. What was his position?

A. General Freight Agent.

Q. You went in as his secretary?

A. Yes, sir.

Q. And you attended to his correspondence, I suppose, and performed such duties as a secretary usually performs?

A. Yes, sir.

Q. How long did you remain in that capacity?

A. I should say 2½ or 3 months.

Q. Did you then give up your work as secretary?

A. No, I then went to the Traffic Manager.

Q. You left that department?

A. No, just merely from one room to another.

Q. You just passed through a door?

A. Yes, sir.

Q. What was the change?

2937 A. None at all; a step up in salary.
Q. You were working for the same party?
A. No, for the traffic manager.
Q. You did the same class of work? As secretary?
A. Yes, sir, the same thing.
Q. Who was the Traffic Manager?
A. Mr. H. Lawton.
Q. How long were you with him?
A. About three weeks.
Q. Then what happened to you?
A. I was promoted to the rate desk.
Q. What were your duties at the rate desk?
A. At first it was to learn the rate business.
Q. Whose superintendence or direct employment were you under at the rate desk?
A. Mr. Lawton was the head of the department. Mr. Ryan was really in charge of the department.
Q. How long did you act in that capacity as rate clerk?
A. Well, I went into the office—I think I was the fourth assistant rate clerk for about two weeks. Then I took the third assistant's position. I was there probably six or eight weeks. Then I took the second assistant's position. I was there some months—I never kept track of the time—and then I jumped to the chief rate clerk's position, and from that to the chief clerk's position in the traffic department.
2938 Q. What were your duties as rate clerk?
A. Checking rates and checking way-bills that might came into the office. At that time we had to check all United States railroad bills; advising the agents over the state the proper rate to apply. After the general freight agent or the assistant agent had been into conference, the report of their conference would come back to us, and we would check in the different rates, United States Mexican lines, the Water Mexican lines and our own lines.
As chief rate clerk and chief clerk, I would talk to parties who came in and wanted special rates. I would investigate their business and decide on the rate if I thought a new rate was due them it would be submitted to the general freight agent for his approval and put into effect.
Q. What do you mean when you say you "checked" rates? What does that cover?
A. Adding combinations of locals to find if any of those rates were lower than our through rates. To check up our tariffs in connection with other lines' tariff and see that our rates were in line; that we were not charging higher or lower than the other roads were; making up figures for new rates desired in comparison with the United States or other foreign lines; general work of the traffic department.
Q. Were there competing lines in the territory?
A. Some of our territory was strongly competitive.
2939 Q. How long were you engaged in that service, Mr. Bee?
A. I couldn't tell you, Judge, the exact number of months

or days that I was engaged in that service, for this reason; I never kept any track; I would be backwards and forwards.

Q. You spoke a while ago about an advance of salary when you went from the superintendent——

A. No, from the general freight agent to the traffic department.

Q. What was your salary before and after that change?

A. I think I was drawing $225 with Mr. Ryan and I got $270 with Mr. Lawson.

Q. That as on the silver standard?

A. That as on the silver standard.

Q. You were not paid on the gold basis?

A. No, sir.

Q. Your work was in the traffic offices, was it?

A. Entirely; all of that work was in the traffic department.

Q. Where was that?

A. In Mexico City.

Q. What did you do after you ceased to be chief rate clerk?

A. I was promoted to the Commercial Agent at Torreon.

Q. What were your duties there?

2940 A. To solicit traffic and watch freight conditions. We had peculiar conditions as commercial agents in Torreon. We had to make reports monthly upon the conditions of service of receiving; conditions of service our competitors were receiving; the time made by our lines and by competitors' lines; general soliciting—work of that kind.

Q. Did you have any change of salary when you made that change in occupation?

A. I was getting $300 a month. I don't remember when the change came. Besides that, liberal expenses were allowed me.

Q. What was that equivalent to in American money?

A. At that time about $167.

Q. How long did you act as commercial agent?

A. I believe at Torreon about nine months.

Q. Where is that place, what part of Mexico?

A. It is about 300 miles south of El Paso, possibly four hundred. We handled kilometers. I believe the dis- is 642.

Q. What was your next experience, Mr. Bee?

A. General Agent at Monterey.

Q. What do you mean by "General Agent?"

A. A change in title, with virtually the same duties.

Q. Practically the commercial agent?

A. As far as work is concerned.—The only thing is when you are a commercial agent you seldom have anyone under you, but as general agent I had three, and sometimes four soliciting men

2941 under me.

Q. In that position, where were your labors confined to?

A. The entire northern part of Mexico. I had jurisdiction over the commercial agent at Torreon and the general agent at Saltillo, whose title was general freight and passenger agent.

Q. How long were you engaged at that?

A. I don't think they left me there but four months.

Q. Your business was to get business to come there, I suppose?

A. And watch the general operations of the road in my territory.

Q. What do you mean by that?

A. Watching the movement of trains to see that we were making time; making reports to the general and traffic manager relative to unnecessary delays and finding out the cause——

Q. That was for the purpose of seeing that your customers got satisfactory service?

A. That was the idea of that, entirely.

Q. What was your next change, Mr. Bee?

A. Our assistant general freight agent, Mr. Synder, who was in charge of the United States traffic, failed in health and he was promoted—changed at least, not promoted, to the position of agent at either Los Angeles or San Francisco, and this left the Assistant General Freight Agency open at Mexico City. I was then changed

2942 with Mr. Bryant, who was commercial agent at Mexico City. He was put to be general agent at Monterey. I was transferred to the commercial agent at Mexico City, and for the balance of my time, my title was commercial agent at Mexico City; though very little of my time was spent as such, I was at Mr. Snyder's desk from that time until I left the service of the road.

Q. What year was that?

A. I went there in 1906, if I remember right, either the last of 1906 or the first of 1907. I don't remember the dates because I kept no track of them at all.

Q. You were there how long?

A. In the neighborhood of a year.

Q. Did you have any change of salary when that transfer was made?

A. I did, fifty dollars.

Q. Your salary was then $350 in Mexican money?

A. Yes, with $5.00 expense a day, while I was in the office, which made a great deal more.

Q. You spoke of a position as acting assistant?

A. Yes, when I was acting—I was doing Mr. Snyder's work during the entire year.

Q. During his absence?

A. He was gone for a year and I was promised by Mr. Ryan if I would stay until January 1, 1908, I would be given the position, but I left there—I resigned the 18th of December—although my resignation did not take effect until January 15th, I understand.

2943 Q. What were your duties during that year?

A. I had charge of all the soliciting forces in the United States and Mexico; the soliciting of business and the general work of watching our freight service as compared with the other railroads; checking in pool reports with the other lines, and making such rates on United States traffic as was necessary also submitting the same to the general freight agent for his approval.

Q. Those salaries probably go into "traffic expense" under Mr. Wharton's division?

A. You will have to ask Mr. Wharton about that. I refuse to answer any questions as to accounting.

Q. Why do you not think you should go into the subject of accounting?

A. Because I know nothing about it. I might have some general ideas, but they are what I have picked up in my work and I have not worked a day at it.

Q. You have no experience in accounting?

A. I could not follow it for a minute and I don't care to answer any questions relative to accounting.

Q. That was the termination of your service with railroads, was it?

A. Yes, I received a telegram on the 18th of December, 1907, offering me this position with the railroad commission of Oklahoma.

Q. When did you enter upon the discharge of your duties
2944 with the Commission?

A. My salary commenced December 26th——

Q. When did your duties begin?

A. I was there that day. I made a trip over into Texas and Arkansas, and, I believe, Wisconsin. I believe I went into Minnesota for the Commission, before I went into the active duties. I had to stand an examination.

Q. That was a civil service examination?

A. No, just an idea of the Chairman.

Q. That was Mr. Love?

A. Yes, sir.

Q. When did that commission get organized and begin its regular work?

A. I haven't the least idea. The statehood was on November 17th and when I got there on December—I really got there about January 1st or 2nd, settling down to work, and there was some proposed order issued when I got there. In fact, I believe there was a hearing on December 2nd or 3rd under the 30 day clause. I presume the first order must have been issued—January, I meant to say—the first order must have been issued in December, as the first rate went into effect either in February or March.

Q. What were your duties in connection with the Oklahoma Commission? I will first ask you what was your title?

A. Well, in charge of the rate department; an official designated on the records of the Commission as "Rate expert."

Q. What were your duties as Rate Expert?

2945 A. It is very hard to answer those questions so one can understand.

I have charge of the rate department. With my assistants I keep a record of all the tariffs, both state and interstate, affecting Oklahoma.

We are constantly checking the rates that apply in Oklahoma as applied in other states; asking the railroads to change such interstate rates affecting Oklahoma as we find inconsistent with other in-

terstate rates; filing suits before the Interstate Commerce Commission; and making rates in Oklahoma—of course that is done by the Commission.

I furnish the Commission with the figures and all the factors.

I appear for the State and attend all examinations. A rate is proposed to be checked in by the state. The railroads contest it. I appear for the State and show the reasons why the rates should be checked in.

Q. You mean that you conduct a hearing——

A. No, the Commission conducts the hearing, but I appear as the State's witness and also as the attorney for the State in some instances; in both capacities; both as a witness for the state and as an attorney for the state.

Q. What is the character of the litigation you institute before the Interstate Commerce Commission? On whose behalf is it?

A. For the people of the state of Oklahoma.

2946 Q. Are the complaints of the business men of Oklahoma made through your Commission?

A. Very largely, yes, sir.

Q. Who represents their interests in those matters?

A. The Commission.

Q. Do you act for it?

A. Very often I have acted as attorney and witness, both.

Q. Is there very much of that?

A. In the way of formal and informal together, there is considerable.

Q. How much of your time does that consume?

A. Oh, a question of that kind would be hard to answer, Judge, because I have some assistants in there who work those papers up and when I get them they are all—I get them first in the rough shape. I make a notation across the face of them of what I want and they came back worked up in proper shape.

Q. In a general way, that is the character of the duties you discharge as rate expert?

A. To a certain extent.

We have checking of Pullman rates. We are checking every character of rate that affects Oklahoma, and in addition to that we are making station checks for the state.

Q. What are those?

A. Checking station agents to see the increase and decrease in the business, and the manner in which the business is

2947 handled.

I have inspectors to check up and see if the Commission's orders are complied with.

I make regular trips on freight trains through the state. I have my inspectors out at different times during the year making their reports to me; work of various characters, Judge, in a year's time.

Q. Does that work there in connection with the Commission take up all of your time?

A. Every moment, unless I steal off for a day or two, as a man generally does.

Q. I believe you are now engaged in a rate litigation with the railroads of Oklahoma?

A. I believe the state is, yes, sir.

Q. Are you connected in any way with that?

A. I guess I am connected pretty strongly with it. I was responsible for a lot of those rates—or at least I advised the Commission of them. Some of them I did not appear in at all.

Q. Are you participating in any way in that case, or taking any active part?

A. Yes, I am preparing data all the time for those cases, although, further than the original affidavits that were filed in the proceeding for temporary injunction, there has been no specific call on me—the Attorney General has in numerous instances called for certain data that we furnished.

2948 Q. You referred somewhere in your testimony to your having testified frequently; was that in this case?

A. No, that was in the Interstate Commerce case. I never testified in those cases. I made ex parte affidavit.

The Southwestern Shippers Traffic Association vs. the Santa Fe is the case I spoke of. I believe the Missouri Pacific is a party.

One reason, Judge, why it would be impossible for me to advise you as to the percentage of time spent in any given duties is:

As an example, the other day, I was checking the local freight. With me I had two tariffs I wanted to check up. Between stations I checked those tariffs. At stations I checked the work of the local freight. I would have to have kept a stop watch on myself to tell you what part of the time was devoted to one or the other of these.

Q. Is that a specimen of what is going on all the time?

A. That is an example.

Q. What effect does the increase in the volume of traffic have on the cost of the handling of traffic?

A. I should judge it would reduce it. That is, reduce the handling of each unit, not the total cost. It would increase the total cost, but it would reduce the cost of handling each unit.

Q. What is the accepted view among railroad operating officials on that subject?

2949 A. The greater the traffic, the less rate one can afford to make upon it.

Q. Is the rate that a railroad can afford to charge or a schedule of rates, I might say, to conduct its business successfully, affected by the age and growth of the road as the railroad develops?

A. I think so, largely, Judge.

Q. You stated that this figure here——

A. 5 mills per ton per mile.

Q. This index figure was never figured by any traffic man?

A. I don't think today it is used.

Q. What is your source of information?

A. I have heard Mr. Stanley Johnson, supposed to be an expert on matters of that kind— of the Southwestern lines—say upon the stand that the railroads had abandoned it.

Mr. Vorhees, General Agent of the Frisco; Mr. B. M. Flippen,

Traffic Manager of the Missouri; Mr. J. R. Koontz—one of the brightest railroad men of the day—I have heard these man say so.

Q. Did they say why it was abandoned?

A. They said it was unreliable.

Q. Did you understand that it was abandoned altogether or abandoned as the traffic——

A. I understood that the figure had been abandoned to
2950 its use in making rates.

Q. On what occasions did you hear those gentlemen testify about that?

A. I heard Mr. Johnson and one of the others testify before a Commission.

Mr. Flippen told me so personally. I was talking with Mr. Flippen about that. The case that caused that discussion was one before the Commission, wherein a vegetable rate was up for discussion and the railroads sent an expert down there who testified that the Commission's rate was unreasonable in that at its lowest point it paid 37 mills per ton per mile, whereas the cost of service was 5 mills. As soon as the railroad heard how their expert testified they came to the front to repudiate the statements.

Q. You stated on your examination in chief, in explaining how these rates were made, that rate makers took into consideration the commodity; the value of the commodity; the points between which commodities move; the competitive conditions surrounding the movement of them and that regard is given to the nature of the commodity:

What is the object in considering all those elements?

A. To get all the traffic will stand out of the rate.

Q. You stated that rates on a low value commodity and one that suffers very little from damage, are made low; while the reverse is true on high rate commodities; that no traffic man would consider the same rate on oil as on sand:

2951 Let me ask you, why would a traffic man consider those elements and those differences as between low and high grade commodities?

A. For two reasons. First, he would not take oil at the sand rate, even if he could not move it at any other rate, because it has with it certain elements that he knows at a glance, would be entirely too risky to take at such a low rate. He would know that the liability clause alone in there would heap up his rate and that he could not afford to handle it on that account, so far as oil at the sand rate was concerned.

When he comes to take the sand rate into consideration his first thought is to move the sand and he puts as high a rate as he thinks the sand will move under. Very often they check a rate and find that the sand does not move, with the result that the rate is skinned down a little.

The feature of liability is what I had reference to and the additional feature that he knows it will stand a good deal better rate.

He knows that oil at its destination is going to be worth 10, 12,

or fifteen cents a gallon, and he knows it is competition and that it has to get here.

Q. That is the element of value?

A. The element of making the rate, and then the element of liability, which will keep him from getting below a certain
2952 figure; no fixed figure, except that he will get what he considers a remunerative rate out of the business.

Q. Is the desire to get a remunerative rate the cause of his taking those elements into consideration? Is that his purpose in doing it?

A. To a certain extent, yes, sir.

Q. And in order that he may determine whether the rate fixed will be remunerative or not, he takes those elemnts into consideration?

A. He cannot tell whether the rate will be remunerative but he can judge as to remunerative return, taking those into consideration.

Q. And he does that and approximates it as nearly as he can?

A. No, not altogether because at times he knows he is not getting remunerative rates, but he has to handle the business just the same.

Q. According to your standpoint, he will get the nearest approximation to remunerative rates in consideration of those different elements?

A. He will not go below that basis if he can get away from it.

Q. Is that not a cardinal rule of action by which all sensible mer are goverened?

A. I don't think there is any reason why a man should ever go below cost of service and that does not say that he stops there
2953 and takes that rate that he considers remunerative. If he finds the traffic will bear a higher rate he puts it on.

Q. What does the consideration of cost of service consist of, if it is not the consideration of the very elements you enumerated as those rate making men would consider?

A. They are the cost of service so far as he knows, but the actual cost of handling a given commodity, no rate man knows what it is.

Q. Then it follows from that, does it not, that while the rate making man has not possessed himself with that degree of knowledge, he does the best he can in view of his ignorance?

A. That is true enough.

Q. And he does take those elements you have mentioned, for the purpose of trying to get a remunerative rate?

A. He comes along on a long distance interstate haul, and gets 18, 20 or 22 mills per ton per mile, on less than carload; he thinks he is doing pretty good and takes the business at that.

Q. Does he not also consider the length of haul?

A. I say, for a long haul, but he does not know what that is costing to haul. He cannot say he is making any degree of profit.

Q. He will assume though, will he not, that there is an advantage in a long haul, and make some concession on account of the length of haul?

2954 A. I don't think he is presuming there is any specific profit. He thinks it is paying his road and goes on and takes

the business. But when he comes in to make a competitive rate and to meet the rate that is already in, he doe*d* not take those conditions into consideration at all. The only thing he takes into consideration then is, can he get this man into that market, at any rate.

Q. To beat his competitor?

A. No; to get in on the same ground that his competitor gets in on.

Q. In the adjustment of their rates, do the rate making men give any consideration to the volume of their business?

A. In special rates they do, yes, sir. I don't think they do——

Q. You stated it was an accepted axiom that as the volume increased, the cost diminished: What is the reason for that?

A. I presume it is. It is a generally known fact that where there are twenty cars moved from a given point, you can afford to give a less rate than for an occasional car.

Q. Would a competent rate man be influenced in the rate he would make upon a given commodity that moved in large volumes, by the fact as to whether he could obtain a reciprocal tonnage and in that way avoid the hauling of empty cars, for the purpose of handling that traffic?

A. I used to think they would, Judge Moore, but I have come to the conclusion that the rate man figures very little on
2955 that.

When I was rate making we used continually to hunt a traffic in the direction of our empty car mileage and were willing to make any rate we could——

Q. So far as your experience goes, that is the case?

A. No, not as far as my experience goes. I said in my rate making with the Mexican Railways it was always our policy to give as low a rate as we felt we could, if we could produce a traffic moving in the same direction of our empty car mileage.

Since I have been with the Commission I have had occasion to request the railroads to do that very thing and have never succeeded in getting them to make a low rate in the direction of the empty mileage.

Q. You are speaking with reference to the railroads in Oklahoma?

A. And those operating through Arkansas as well.

Q. I wish you would give me some of the instances you have in mind, in which you have requested railroad officials to consider the matter of reciprocal tonnage?

A. It has been definitely ascertained that on all lines leading from Oklahoma south, that the business for the loaded movement is in the southbound direction on Oklahoma lines. We have asked them to give us a less rate from the south to the north, into Oklahoma, than what we had in the opposite direction. They have refused to do this. We have the same rates from Galveston
2956 to Oklahoma points, as you have from St. Louis to Oklahoma—that is comparatively on the distance, $1.30 and $1.33—which figures about the same rate per ton per mile.

Q. Is not that a different proposition?

A. No, sir: the empty car mileage is northbound and they are bringing up these empty cars and not securing new business. The business is handled through Newport News, but if they gave us a low rate we would get the business running through Galveston.

Q. I do not clearly understand just the position you portray: I thought you were talking about a case in which there was tonnage both ways and you requested some concession on that account?

A. No; your question to me was, that where — is an empty car movement—you did not ask it, but your question implied that where there was an empty car movement in a certain direction, that if a railroad could secure traffic to fill those empty cars——

Q. No; you misunderstood:

My first question was whether a railroad could not afford to make a lower rate where that condition prevailed, and then I asked you if that was not a consideration that a rate making man would consider: you stated it was not, and then you spoke of instances——

A. I stated it was when I was in the rate-making busi-
2957 ness, but that it was not today, for the reason that the railroads were refusing to do that very thing.

Q. I supposed you had in mind a case where they had tonnage to move in the opposite direction?

A. It is where they could get tonnage to be moved if they put the low rate in, but in view of the fact that they do not put in the low rate, they can't get the tonnage.

Q. Who are the officials of the railroads to whom you have made that application?

A. All the lines operating through Oklahoma, with the possible exception of the Missouri Pacific.

Q. Give me the names of the traffic men you refer to?

A. We were in conference with Mr. Koontz, of the Santa Fe, the General Freight Agent; and we were in conference with the Rock Island and the Frisco——

Q. With whom?

A. I don't remember, because one day Mr. Shubert or Mr. Allbright or Mr. Brown might come into conference.

Q. Did you confer with all three of those gentlemen?

A. I say, for the Rock Island it is hard to say, because one day one will come and the next day another will come.

Q. With whom did you deal for the Frisco road?

A. I presume with Mr. Vorhees.

Q. What was the business that they refused to haul northbound?

2958 A. All commodities.

Q. You mean general freight?

A. Yes, sir; general freight.

Q. Well, do not the railroads carry all the freight that goes north destined to points their lines will reach?

A. Yes, but if they put in a low rate, they would get freight that does not go north; they would create freight they don't get today; they would fill up those empty cars that are going up light.

Q. What do those cars haul that come back empty?

A. Grain, cotton, machinery and general merchandise for Texas distribution.

Q. Your proposition was to influence the traffic representative of the railroads to lower the rate on miscellaneous northbound traffic, with the expectation that they would build up an opposite trade?

A. They would.

Q. What was your view about it?

A. This—so strong was the view that we organized the Southwestern Traffic Association and the matter is now handled by the Interstate Commerce Commission.

Q. You were proposing to them to make an effort to develop a traffic down there in that way?

A. Yes, to bring a traffic from the Atlantic seaboard points and bring it by its natural gateway, Galveston.

Q. To divert it from the inland rail lines?

2959 A. Inland sea and rail routes. It moves sea, anyway, to some of the Atlantic coast points.

Q. To go back: we have gone a good way from the point we started:

In view of what you have stated in connection with the elements that are taken into consideration—since you have been discussing this subject this morning—with reference to the effect of value; length of haul; liability incident to the haul, the nature of the commodity; and in view of your statement that those matters are considered by traffic men, although you think they have not the information as to what the cost is, I want to ask if you think it is correct that traffic men do not give any consideration to the cost of service in fixing rates?

A. I think they give very little——

Q. Then why do——

A. —consideration to the actual cost. Now, understand me. I don't want to be understood as saying that a traffic man is going to solicit a shipment or make a rate on any figure that might come into his head. I don't want to put a traffic man in that light. I don't want to indicate for one moment that any traffic man is that much of an idiot. But I mean, he is not figuring what the cost of service is. He does not know that the cost of service represents six mills for 100 mile haul or eight mills for a 50 mile haul. He has no figures of that kind. He takes a rate and tries to get

2960 what he can out of it. He has in his head, probably, an arbitrary figure that he will not go below, but if he was asked tomorrow to testify as to the cost of service, he would be unable to do so. He is trying to hold the business down so his road can get some money out of it. He is taking business and instructing his men to take business which is paying him enough, or he thinks is paying him enough. He considers he has to take it to keep his trains moving.

Q. And you stated a while ago that he could not give the cost of service?

A. Or even approximate it.

Q. In the nature of things, it is quantity that is unknown to him,

yet in fixing the rates he regards the cost in so far that he will not fix a rate which is non-remunerative, and he does consider these elements you have mentioned?

A. He would fix that on a new rate and a rate over which he had the power to make it; there is no doubt about that.

Q. That is where the conditions are normal?

A. Where the conditions are entirely in his power. The other might be a condition where he would not have any power over the rate at all. Some one else might have stepped in there ahead of him.

Q. What is the object of the creation of these Classification Committees?

A. To assist the railroads.

Q. In what way, Mr. Bee?

2961 A. Why, by specifying certain men to do a certain work that can be done better than by saying the whole should do it.

Q. Is not the classification made on the basis, of the very elements, with reference to the factors that you spoke of awhile ago, as matters that would be considered by traffic men in fixing the rates? In other words, do they not consider in making that classification, the value, weight, bulk; liability to injury and therefore damage liability; all those things? Do not those Committees in making their classifications take those things into consideration for the purpose of creating a classification that will enable the railroad, by applying their rates to it, to create rates with reference to the cost of service, in so far as that cost is affected by those factors?

A. I don't know about the cost of service. They are supposed to take those factors into consideration——

Q. Do you know why they do that? Why——

A. They are taken into consideration to a more or less extent; the value of the commodity; the shape of a commodity as against another commodity, more than anything else.

I have been in those meetings and listened to a part of the proceedings and there comes in more the question of one article to another article, than anything else.

2962 I never heard the cost of service discussed—what it costs to handle a box 14 x 14 x 16, but it was the whole, the nature in which that box would load, and the liability from loading other commodities along or beside it. All of those features were features in the cost of service.

Q. Is not the relation, this relative quality and a comparison between the different subjects of traffic, the consideration of it, the very essence of the adjustment with reference to the cost of service?

A. No, sir, if you knew the cost of service of one, then it would be.

Q. Let me make myself a little plainer: the Western Classification Committee, we will say, puts a higher classification on glass than it does on sand, does it not? It costs more to handle the glass than it does the sand——

A. That is one of the factors and another factor is that the glass

is much more expensive than the sand and will stand a higher rate, and that is one of the main—liability is one of the factors followed in making the rate, and the value of the commodity is one of the factors. Those are factors which they use.

2963 Q. Do you know Mr. F. O. Becker, Chairman of the Western Classification Committee?

A. Very well.

Q. Mr. F. O. Becker testified in this case, and he stated in his testimony that his committee, in making up classifications, primarily take into consideration, the density of the article——

A. In other terms, that is its loading capacity.

Q. But that is not all he said, because he said, the lighter and more fragile it is, the more it costs to transport it—page 469—that naturally follows, isn't that the object in making the classification?

A. Yes, the difference between the two commodities.

Q. He says, secondly, the value, because the greater the value, the greater the risk, which enters into the cost of handling and transportation?

A. And he could have added, the value of the commodity would indicate the higher rate the commodity could stand.

Q. He was asked if the space the article occupied had anything to do with it, and he said it did.

A. That was answered in his first proposition.

Q. He was then asked if the cost of transportation included the transportation, service, and handling and risk incident to handling, entered into the classification made of it, and he said always.

A. I fail to see where Mr. Becker could make that answer, for this reason, that Mr. Becker and his committee are making a

2964 general classification applicable over what is known as the western classification territory. Part of that is the line of the Atchison, Topeka & Santa Fe, partially double tracked, and with the highest standard of maintenance, kept to the highest standard of maintenance, over which their engines can pull the heaviest trains with little hardship, and at the same time it controls the little Oklahoma Central Railroad in Oklahoma, which is built on a heavy grade, and on which engines could not pull a fourth of the tonnage that they could pull on the Sante Fe; if his classification represents the cost of service, I would like to know whether it represents the cost on one road or on the other road.

Mr. HILL: I don't think it is hardly fair to read that answer, without reading his qualification; he says further on, that they have no statistics of the cost of service; I don't think you have put his testimony fairly to Mr. Bee.

(WITNESS:)

A. I don't think that he could answer that way.

Mr. MOORE: If it is qualified, I want to get it in here.

Mr. HILL: Page 472 on cross-examination.

(Mr. MOORE:)

Q. On page 472, Mr. Becker further stated on cross-examination, in answer to question of how they got the cost of service: "We know
that it costs to transport; that it costs to handle; that the
2965 element of risk necessarily enters into the cost; we, of course,
do not know the total cost, but all of these are factors in the total cost." Then he was asked if he used per ton per mile as a basis in ascertaining the cost of a given line of road, or through a given country, and he answered "No," that he gave no consideration to that.

Mr. MOORE: Anything else you want to call his attention to?

Mr. HILL: Yes. "You know this element of risk exists, and you bring to bear your experience and your observation on that, isn't that a fact?

A. Yes sir.

"Q. You have no actual figures on that.

"A. No, sir, not definitely.

Mr. MOORE:

Q. Counsel for defendant in this case have made some additions since I have asked these questions, for the purpose, very properly I think, of bringing before you another statement of Mr. Becker, that the Committee in making these classifications, does so, in so far as it is possible for them to do it, with reference to the cost of service. Do you agree or disagree with him on that?

A. I agree with him, as I said before, that classification is built
upon the relation of the cost between the two articles; it is
2966 not made on the actual cost of service to handle it, and I
don't think Mr. Becker intended that; as between the first and second classes, Mr. Becker is trying, in making the classifications with his committee, to so arrange those two commodities that they bear a relation to each other, but not that they bear a relation to the cost of service, but to each other, and as far as traffic conditions are concerned, the revenue coming from them, he feels that one commodity will stand a higher rate than the other, and it goes in the classification higher, and that is what I think Mr. Becker refers to when he says the cost of service is the basis.

Q. Isn't it also true that traffic men in making rates, are influenced by the same considerations?

A. To a certain extent they are, yes, sir, not to the actual exact cost of service,—I want to be understood at all times, in making a statement that a traffic man or any traffic man takes into consideration the cost of service or the approximate cost of service; that I mean that he attempts it between the two articles only; rates are made upon a comparison entirely.

Mr. HILL: I would think it would be fair to give this other statement——

Mr. MOORE: You will have to go into that on re-direct examination.

Mr. HILL: I think when you question him about the testi-
2967 mony of a *a* witness, a full statement would only be fair.

Judge DOOLEY: That would seem to be so, but the question is, is it exactly the same subject.

Mr. MOORE: If you will give me the page I will see.

Mr. HILL: The last question page 476, printed volume #2.

Mr. MOORE: No, I will not bring that in, that is talking about a special condition down in Texas. I am talking about the general conditions.

Mr. MOORE:

Q. On your examination in chief, counsel read you certain quotations from the testimony of Mr. Nay, the auditor of the Rock Island Railroad, in which Mr. Nay stated if the rates represented the cost of service, he presumed they were in proper relation to each other, and when I say proper relation to each other, I mean with reference to the cost of service; and a number of quotations are made there; now I want to call your attention to some other statements made by Mr. Nay that were read to you. Mr. Nay made this further statement, page 343, vol. 2: "The position I have taken is that the cost is not the only factor that is taken into consideration, that the cost is considered. Now, of course, rates might be based—

I can conceive of a case where rates might be based largely
2968 on something else than the cost. But if they were made in such a way as not to consider the cost at all, then of course, the values of the figures for dividing expenses between state and interstate would not be very great. But, in my experience, I do not recall rates of that kind." On page 345 of Mr. Nay's testimony, attention was called to the testimony of Mr. Watson, that the commission tariff of Arkansas was not properly constructed, so far as the relations of commodities and classes was concerned as bearing upon the proposition that he was testifying in regard to. Then he was asked the question: "Assuming Mr. Watson's statement to be true, would it be proper to use the revenue derived from such a tariff as the measure of cost of the operation of intrastate traffic? A. I think it would be proper, as I say, because I think it is the best basis I know of. It would not be accurate, and I think Mr. Watson's testimony would bear out what I have said, that he does consider the cost of service when he makes a rate, although not entirely perhaps." Further, on the same page, he is asked if the revenue derived from such a tariff—referring to the Commission tariff which Mr. Watson had spoken of—would be a measure of the cost of intrastate traffic, and he says "Yes, sir, it would be a measure, not an accurate measure, but I think the best known measure." Don't those statements from Mr. Nay coincide practically with the

suggestion made by you in your answers to questions I have
2969 asked you, that in your view it is impracticable to ascertain the cost of handling commodities separately, and that any consideration that is given, is given relatively, and that it is naturally inaccurate; now, is that not in accord with the views expressed by

you, and is not the testimony of Mr. Becker, to which your attention has been called by myself and by counsel for the state in this case?

A. To an extent it is, and to an extent it is not; Mr. Nay says he still thinks those factors should be used for dividing the cost, and he says that they are not made upon any relation to each other, and if they are not, I fail to see how you could divide the cost upon them; if they are not properly made as to the factors of cost, I don't see how you could.

Q. Isn't Mr. Nay's statement, that while they are not made entirely and fully, and there are other considerations entering into them, that they do afford a measure by which the relation of cost can be ascertained between the different articles of transportation?

A. I don't think you could find any measure of dividing the cost if the rates are not based relatively properly; if baskets were taken at a less rate than bar iron, I don't think there would be any way by which you could divide the cost by the revenue received from those two commodities.

Q. Are your statements in this case based upon that idea?

2970 A. No, I don't know that those conditions exist; if they did exist, I understand Mr. Watson testified the tariff was not properly built as to the relation of one article to another, and as an example of that, I say if baskets were taken at a less rate than bar iron, you could not use those factors in dividing the cost, because if you did, you would be making bar iron pay a higher rate than baskets were paying, when it is a known fact that it can be handled at a much less rate, and there comes again the question of cost; none of us know the cost of handling 100 pounds of baskets or 100 pounds of iron, but a traffic man knows that 100 lbs. of iron will cost less to carry than 100 lbs. of baskets; he knows at a glance, just looking at the two commodities, that 100 lbs. of iron can be handled at a figure much cheaper than 100 lbs. of baskets.

Q. Is that the reason rates are made higher on baskets than on iron?

A. Yes, sir, exactly; those things come into view; 100 lbs. of baskets is much more valuable than 100 lbs. of iron; they would stand a higher rate; every condition gets into it.

Q. It follows then, doesn't it, that the adjustment of rates is not made regardless of the cost of service?

A. I would say that they were made regardless of the cost of service, but not made regardless of the relative cost.

2971 Q. I want to understand the difference.

A. Use *that* the word "relative" as between the two items.

Q. You concede then that in the adjustment as between the different articles of transportation, the element of cost is a consideration?

A. What is considered an element of cost, and that is true only when a man is making a rate where he has no ties holding him down at all.

Q. What you mean by that is, that there may be an exceptional condition in which that rule would be departed from?

A. If he is making a competitive rate he cannot lay to that a moment.

Q. Do you assume that traffic men, even one engaged in making competitive rates, so far lose sight of what it costs to handle traffic that they will make a rate which will not afford compensation and on which they will lose money?

A. Yes, sir, I know it is done.

Q. Take for a moment this Texas lumber rate, about which so much has been said, do you understand that the Iron Mountain Railroad and Cotton Belt Railroad will take traffic under those zone rates upon which they will lose money?

A. My idea is, Judge, that that 22 cent rate blanket from Louisiana and Texas to St. Louis, is an unremunerative rate.

2972 Q. That is your idea; do you know that from any direct connection with the matter?

A. No, sir, nor do I know any other man that does know.

Q. Suppose the general freight agent of the Iron Mountain Railroad, and the Assistant General Freight Agent of the Cotton Belt Railroad have both testified in this case, and they have both testified that as to certain territory and certain parts of the lumber that moves under this arrangement, they decline to participate, and to use their schedules; if those men are correct in that statement, it follows, doesn't it, that even in that exceptional condition, they do conduct the business, the traffic of their companies, with reference to the cost involved in the rendition of the services?

A. There might be other factors; there might be some line they do not care to participate with.

Q. They put it on that ground, that they did not care to participate where it was non-remunerative.

Mr. HILL: Where did they say that?

Mr. MOORE: I will call your attention to it before I get through with it.

Mr. MOORE:

Q. If those gentlemen make that statement, you would not be prepared to dispute it, would you?

2973 A. Not as to their ideas, no, sir.

Q. And it would follow then, wouldn't it, that even in that case which has been brought up here as a very high example of improvidence on the part of the railroad officials in rate making, even in that case, they though they were acting with reference to the cost of service?

Mr. HILL: Who has brought that up as the heighth of improvidence?

Mr. MOORE: I think you have.

A. I would say if the general freight agent answered the question that he refused to participate in the movement because he would lose on it, he was figuring that out of that 22 cent rate that at times from the extreme southern part that he was not making a figure of profit, and his idea of what would compensate him for what he

was making on the northern end of it, and that he was trying to make some one else bear the burden.

Q. It is in evidence in this case, that there is a reciprocal movement with reference to that lumber traffic and grain traffic, to which your attention has been called; I will ask you if a traffic agent of a railroad, in adjusting rates with reference to the cost of service, and whether the business would be remunerative or otherwise, would not properly take into consideration the factor of the traffic being balanced back and forth and that reciprocal feature.

2974 A. Yes, sir, if he was not excepting one of those factors, the original factor that moved the cars, if he was not accepting that at a competitive rate which was considered by him a low rate, but if he was, then he should not accept northbound movements at the same rate, or if the original movement which moved the cars should show a good figure and should be a good rate, then he would be justified in accepting the movement in the opposite direction of almost any kind.

Q. Suppose I would say, here is a commercial condition that exists, and if we don't put in as low a rate as we can afford to put in, we are going to do this section of the country an injustice, and cut them off from the market, and in addition to that, we have competing lines, and if we do not do that, we will lose all that business; now, if we can haul another commodity in the opposite direction at six cents a ton per mile, and if we can make that on the other movement, we will make money both ways, would you say that was disregarding the cost of service?

A. No, sir, if he could get any commodity that would pay him six cents per ton per mile, he would handle it quick.

Q. I mean mills, of course.

A. That would be a factor in rate making; there is no ifs and ands about it; I knew what you meant; there is hardly anything that moves, even in carload rates at six cents per ton per mile.

2975 Q. You are referred in your testimony in chief to a fact which you said showed that rates are not built upon the cost of service, and cited an instance in which emigrant movables transported from Oklahoma into Texas, or Texas into Oklahoma would take Class "D"—"C" or "D," while if they were moving Oklahoma to Kansas or Kansas to Oklahoma, or Missouri from Oklahoma, that they take Class "A;" if they were moving through Oklahoma from Missouri or Kansas to Texas, they take Class "D," so that there would be absolutely no relation to the cost of service in the movement; then you state in that connection, that the liability in transportation of that class of traffic was the highest known, and in the same connection, you say that it is a commodity that railroads never care to make a profit out of,—I suppose because of the higher degree of liability.

A. I mean that it is a traffic that seeks to build up the country and railroads handle it at a low figure in order to build the country up.

Q. Aren't those low rates always given in consideration of a release of that high degree of liability?

A. Sure. There is no doubt about that, but even then there is a degree of liability, and I think there is more claims paid on emigrant movables pro rata, than on anything else that moves.

Q. But if an emigrant goes to an agent to ask for rates on
2976 movables, the agent wants to know immediately whether he will make a waiver of liability?

A. Down to $10 a hundred pounds.

Q. And the classification under which it will move always depends upon that, doesn't it?

A. No, sir, that doesn't affect the two classes of rates; both are predicated upon a waiver; I believe they are "B" and "D" and "A" and "C" if I remember the rates specified; I know there is a difference of two classes between Oklahoma and Texas and Missouri and Texas or Oklahoma locally; it is "A" and "B" in Oklahoma and north, and "C" and "D" in Texas and north, but the waiver is there in both cases, down to $10 per 100 lbs. Really, I mean that the railroad companies did not seek to make a profit; I did not mean upon account of its being a high liability commodity, but because railroads are seeking that traffic upon any figure they can get it.

Q. That is one of the cases in which they give an exceptional rate in order to build up the country by getting emigrants there?

A. Yes, sir, that is the idea, but at the same time, the difference between the rates in Oklahoma and through Oklahoma shows that the cost of service is not an element in making the rate, because they would have to make the same rate in both cass, if it was.

2977 Q. I don't know whether I can quote your figures exactly, but to illustrate the principle, assuming that the rate on lumber from some point, we will say in Oklahoma to Little Rock is 23 cents, that the rate is the same from the same place to Kansas City, I want to ask you if you know whether in the transportation of that product from that place to Little Rock, there is a reciprocal return movement,—whether the cars brought there do not go back empty?

A. I could not answer as to that.

Q. Wouldn't that be a very important factor in determining the relation of those rates?

A. That would be a factor, yes, sir.

Q. Do you know that the rate which you speak of—my impression is you said 18 cents.

A. What is that rate?

Q. The lumber rate from that territory to Little Rock?

Mr. HILL: It is 18 cents from that zone to St. Louis, but 22 cents from that zone to Little Rock.

Mr. MOORE:

Q. Whatever it may be, I am not assuming to quote your figures.

A. What figures I quoted were put in my mouth, I didn't quote them from personal knowledge.

Q. You don't know anything about the conditions under
2978 which that product is transported at those rates, do you?

A. Only generally.

Q. The facts are, I am informed, as a matter of information, and I think it is in the testimony in this case, that the rate from those sections, that rate that was given you, is only when the tonnage is moved through on the lines—I am speaking with reference to the railroads in this litigation, on the Iron Mountain and Cotton Belt Railroad,—those rates apply and only apply where lumber can be moved all the way over their rails, and that rate does not apply when there is a connecting line participating in the movement. You don't know whether that is so, or not?

A. No, sir.

Q. That would affect it also, would it not?

A. Naturally, it would mean no division for the other lines, and having the rate for themselves.

Q. In that connection, I want to call attention to the case you cited here, an instance you cited; you stated that the rates on lumber as you remembered them, from Texas and Louisiana fields to Oklahoma were 18¾ cents?

A. That is the maximum rate in Texas.

Q. That gradually varies from the last station northbound on the Kansas line until they pay something in excess of 26 cents, and that rate immediately jumps to 27 and a fraction in the State of
2979 Kansas, and goes on until you reach Kansas City and there it drops back to 23 cents?

A. Yes, sir.

Q. In connection with that condition, you stated that at a conference between the commission and all the railroads,—that is the Oklahoma Commission you mean?

A. Yes, sir.

Q. This rate was reduced to points in Oklahoma, and then you give the reason?

A. Yes, sir.

Q. You said in order to keep a case from being filed before the Interstate Commerce Commission, which would have resulted in a general reduction of all lumber rates, and the only reason for the higher rates at points on the Oklahoma line is that it only applies to two or three little stations there; why would that have been brought before the Interstate Commerce Commission and why would that have been the result?

A. Because it was a violation of the long and short haul clause, and I think we could have very easily have persuaded the Commission,—proved to the Commission, if they could afford to haul lumber to St. Louis and Kansas City for 23 cents, they could afford it to Oklahoma at the same rate.

Q. Meaning, I presume, the cost of service in hauling it was not taken into consideration?

2980 A. To a certain extent the cost of service would come into consideration; if they could haul to Kansas City and St. Louis for 23 cents, they could certainly haul it to Oklahoma, half way, intermediate point for that.

Q. It was your idea, when it came before the Commission, if they could afford to haul it to this point, the longer distance for 23 cents,

they could certainly haul it the same distance, or a shorter distance, for the same or a lower rate?

A. Yes, sir.

Q. Doesn't that involve the very essence of expense in hauling it those distances?

A. No, sir, that 23 cents may be an unremunerative rate to Kansas City; as between the relation between the rates, the cost of service would enter into it; if it represented the cost of service at one end of the line, it would not represent the cost at the other.

Q. That is the ground upon which an appeal would have been made to the Interstate Commerce Commission?

A. To a certain extent.

Q. You say at one time, speaking of lumber, that the intermediate rates were higher than what was known as terminal rates applying at St. Louis and Kansas City. What do you mean by a terminal rate?

A. The rate to Kansas City is considered a terminal rate.

Q. Why is it considered a terminal rate?

A. It is the terminal point; they take the big points and
2981 give them terminal rates.

Q. It is a common point rate, isn't it?

A. No, sir, a common point rate is a rate that applies to a given territory, and a terminal rate applies to a certain point, and it does not necessarily apply backward.

Q. Intermediate rates were higher than at those particular terminal points you spoke of?

A. Yes, sir.

Q. Now, what I want to ask you is,—those terminal points were competitive points, and that is what created that exceptional condition, wasn't it?

A. Not necessarily so.

Q. What did create it?

A. I don't know what created it. Because the line originally making the rate might have had a haul twice as long as to some intermediate point, it is always hard to tell.

Q. Do you know the history———

A. I will give you an example; right now, we have into Oklahoma from Sugar Creek, Missouri; a big oil refinery, we have 17 terminal rates of 35 cents, and the rest of the rates are 43; I have tried for many a day to find out what caused those terminal rates, and I have never been able to say what made them; it is 35 cents to Oklahoma City, Chickashaw, Muscogee, and Enid, but a station either side is 43; we don't secure enough oil from Sugar
2982 Creek to pay the Commission to go before the Interstate Commerce Commission to find the reason for those rates and try to get them reduced; we have so many refineries in our own state, and because it is nothing but these big cities that will draw oil from this refinery, we have never taken the matter up.

Q. It is probably some local condition?

A. I couldn't appreciate a local condition that would apply to 17 points, and not apply to the others; I figured out first that some line

might be the short line, but that wouldn't apply broadcast over the state.

Q. What railroads are they participating in that movement?

A. Frisco, Santa Fe, Katy, and Rock Island.

Q. It doesn't affect transportation in Arkansas?

A. Not that I know of in any way; I was simply giving you an example of what terminal rates sometimes were; they were all called terminal rates in the tariffs.

Q. Were they terminal rates in the sense in which you used the expression awhile ago in its application to St. Louis and Kansas City?

A. Yes, sir, it applies only to that terminal, and does not apply anywhere else; that also means, that the rates do not apply between the terminal and point of origin.

Q. In speaking of rates in the State of Arkansas, lumber rates and others, making a comparison of those, you are not
2983 speaking from personal information and knowledge you have as to what those rates are?

A. Partially so; I have made some comparisons upon them.

Q. I believe you said the lumber rate, you had made no comparison on that?

A. No, sir, generally I have made a number of comparisons on Arkansas rates just for my own benefit.

Q. In speaking of the flat rate on grain from Oklahoma to other states, you stated it was irrespective of the number of carriers that handled that; do you know, say for instance, whether the Cotton Belt Railroad handles any grain that goes from Oklahoma into Arkansas?

A. I couldn't answer that without having the tariff; I know that as high as four or five lines participate in that.

Q. You don't know whether that illustration applies to the line of road of the Cotton Belt?

A. The tariff would be the best evidence.

Q. What is the movement of grain from Oklahoma into Arkansas.

A. You mean is it heavy or low?

Q. No, sir, I not only mean that, but what are the lines by which it moves?

A. The Frisco handles a considerable part of that grain, delivering it to the Arkansas lines; I don't know their junctions where they do deliver, but I often see billing going into Arkansas; and the Fort Smith & Western Railroad handle in connection with
2984 the Sante Fe and the Rock Island.

Q. Aren't the rates on those lines that you speak of, where you speak about the inequalities, are those rates not just for the purpose of enabling grain to move from Oklahoma east?

A. Yes, sir.

Q. What would be the effect if that arrangement were withdrawn, upon the movement of Oklahoma grain?

A. That grain would have to find another market.

Q. It would be excluded from the State of Arkansas?

A. Those rates apply not only to Arkansas, but through Arkansas into Tennessee, all through that country.

Q. That is a commercial condition that is being met by those rates which you speak of as exceptional?

A. I wouldn't call them exceptional, because it is a natural condition existing throughout the United States; the Oklahoma grain rates moving east, is but one factor in the natural conditions that exist.

Q. You state that there can be no contention that these rates are made upon the cost of service, and the reason you say that is, that a car of wheat moving from Alva and Enid take the same rate; either one is exceedingly high and above the cost of service, or the other is exceedingly low and below the cost of service, and it is impossible to say that those two rates, being exactly the same, are built upon the cost of service in both instances. I under-
2985 stand that there is a very large volume of that traffic.

A. I wouldn't say a large volume; there is probably 100 cars a year moved across there, that is, for eastern country; there may be more; I have seen as many as 20 cars at a time.

Q. Is it your idea that railroads are hauling that traffic at less than it costs to handle it?

A. I don't remember the figures on that rate.

Q. You don't give the figures, but you speak of it as an illustration?

A. I spoke of it in this way, that if the rate from Enid represents the cost of handling, then the rate from Alva, which is probably 70 miles beyond, is below the cost of service; if the rate from Alva represents the cost of handling, then the rate from Enid is a high figure of profit.

Q. What is the average length of haul of that grain?

A. I wouldn't care to make an estimate, because that grain moves into Memphis, and the rates apply into Memphis and Mississippi—they apply everywhere.

Q. How far are those two points from the western border of Arkansas.

A. It would be but an approximation on my part.

Q. It is a long haul?

A. Yes, sir.

Q. The terminal handling would be the same whether the stuff was moved from one place to another?

A. Practically so; of course, no grain would originate
2986 right at Enid; it would be brought in there.

Q. Assuming that grain comes across a considerable part of Oklahoma and across the entire State of Arkansas, travels for several hundred miles, would you say that the expense of handling is the same, or that a few miles difference in the haul would make a very material difference so as to make it very high at one point, and very low at another?

A. I was speaking of a shipment into Fort Smith.

Q. If it was Ft. Smith, you don't reach Arkansas territory—it is right on the Arkansas border?

A. It goes into Arkansas, making it interstate grain.

Q. How many miles is it?

A. About five miles I think, I wouldn't state the exact length; that group extends over a much larger territory than that 70 miles; there could be a haul of considerably more than 100 miles difference; our grain crop is from the north and south of the state.

Q. I was speaking of the illustration you made.

A. That illustration was to Ft. Smith.

2987 Cross-examination of C. B. BEE, resumed.

Cross-examination.

By Mr. MOORE:

Q. You say that the cost of moving 100 lbs. of baskets is ever so much higher than 100 lbs. of iron?

A. I think it would be so considered.

Q. Assuming that is correct, wouldn't the revenue more nearly represent the cost of handling those two commodities than the ton miles of each of them?

A. Not if the rate on baskets was lower than the rate on bar iron, it wouldn't.

Q. Do you know how they are classified?

A. Bar iron, I think, is 3rd or 4th, and baskets without exceptions, is either 1 or 1½ or double, according to the way they are shipped.

Q. That would make a good deal of difference?

A. If there were no exceptions.

Q. Assuming those two facts, that it cost more and the rate was higher, which would represent the cost of service better, the revenue or ton miles?

A. The revenue would nearer represent the figure that would represent the cost of service; wouldn't any figure represent the cost of service, but the revenue would be nearer than the ton miles would; that would be presuming they both moved the same distance under the same conditions.

2988 Q. Doesn't the difference in the rate, being based on the difference in the character of commodities, run through the various incidents of the transportation, whether long or short and so on?

A. If bar iron was moving within the state and the baskets without the state, the chances are that the revenue accruing to the lines would be practically the same per ton per mile, and to divide the expense upon that basis would be absolutely foolish.

Q. Judge J. G. Wallace was the chairman of the Arkansas Railroad Commission at the time the Commission rates in that state were made, and participated very actively in making up of those schedules. I want to call your attention to what he says in regard to the basis upon which the rates were figured. He was asked on what basis they were made, and he said the value of the properties had much to do with it. "We considered they were entitled to a

fair return on their investment and amount of traffic they were doing, and we thought would be done under our rate sheet."

Again, he said: in answer to question, if in preparing the schedule of rates, the Commission made any investigation as to the cost of service and operating trains, he said:

"Yes, we considered that the best we could; we found that nothing but actual tests will demonstrate the rate at last, that the railroads themselves cannot sit down and figure out by any rule—they can approximate but they cannot sit down and figure out
2989 just what would be a just rate, but they simply put in a rate and apply it, and if they don't make money on it, they take it out and keep putting in higher rates until they get one by which they can make money; there is a great deal of speculation in it. Of course, men sitting down here, it is all well enough to consider all these things and they do, but then at last, this is the test." Speaking of the commission: "We were going to do just like the railroads." (P. 247.) Now, is that in accordance with the views you entertain in regard to the relation between the cost of the service and the rates?

A. No, sir, I don't think a railroad man puts a rate in to see if it makes money and then puts in a higher rate if it does not.

Q. Your view is different from the Chairman of the Arkansas Commission that put in these rates?

A. Yes, sir, there would be no stability to rates whatever, if that was the condition.

Q. Would there be any stabilities to railroads if there wasn't a relation between the cost of rendering the service and the compensation received for it?

A. When you say "relation," no; the railroad company must earn its remuneration above expenses; it would have to earn that or go into the hands of a receiver.

Q. How can they do that except by adjusting their rates upon such a basis as would afford them proper compensation upon the service rendered, and which will in addition provide a just return upon the investment?

2990 A. My idea and experience has been that rates were put in and were supposed to be put in high enough; I have never known them to be continually raised, but I have known them to be continually reduced.

Q. Why do they reduce the rates as business increases?

A. Because they are always put in at a high figure.

Q. Why is that done?

A. It is general practice.

Q. Wasn't the cause, in putting rates in, in view of what you have just said, that they wanted to put them in high enough to assure a reasonable profit, and isn't the reduction as the volume of business increases, resultant, to a large extent at least, from the fact that as the bulk of business increases, they can reduce their charge for the service, and at the same time obtain compensation for their services?

A. That is partially it, but mostly, it is a question of necessity

for the rate to be reduced. As a rule, everything is made on class rates. Class rates are put in, and there they stay; they are always considered extremely high. A man develops business, and he goes to the railroad company and shows them he has developed a business, and special rates are checked in, as we call them, from that point to his point of distribution; there were no cement rates in Oklahoma except class rates for a long time; cement industries came into the state, and they were checked in specific rates to the
2991 different points of distribution as the business grew. The railroads saw that competition from another point was hammering that plant; they investigated that cement company's books, they find a necessity for a lower rate; they get before their committee and they investigate every detail of that business and a little more is taken off, and then there might be a time that called for an increased rate; say, at the end of the year, there is no profit, then I suppose the railroad would have the choice of raising the rates, or the traffic men would raise such rates as they thought they would stand.

Q. The meaning of that is, if they are satisfied a rate is higher than it should be, with reference to the condition of the business, they will lower it as far as they can without putting it below the cost of production, so to speak, but when they get below that, if they find at the end of the year it costs them more than——

A. I don't know that the traffic man figures the cost of production.

Q. I am speaking about results? He would consider it unconsciously, wouldn't he?

A. Unconsciously; if at the end of the year shows a loss, something has to be done.

Q. Isn't the business of a railroad like the business of a merchant, if a merchant sells a million or two million dollars' worth of goods, he can sell it at a lower rate than another mer-
2992 chant who does not sell so much.

A. That is true enough, but a merchant knows what he is making on each commodity he sells.

Q. That may or may not be true; be that as it may, the same principle that governs the merchant applies to the railroad, does it not? So far as the result is concerned?

A. So far as the total at the end of the year is concerned, so far as the handling of the business end.

Q. It is the total arrived at by the application really, of the same method in toto that applies to other business, but those methods do not apply to details of railroads?

A. I do not think they are, that is, as to the total; as a sample of that, we had before us a railroad that came in and made a showing and asked for an increased rate; the only showing they made was that the rate per ton per mile had decreased; that was the only showing they made, and when we examined it, we found they had increased about 20% in their total net proceeds for the year, but there was merely a decrease in their ton mile rate, which means

nothing in itself; that is really the only thing the traffic man has to go by, is what his road realizes for the year.

Q. You are speaking of the total business?

A. Yes, sir.

Q. The earnings per ton per mile in the aggregate do not throw any light upon the rates in detail?

2993 A. No, sir, not on the rates in detail; nothing in the aggregate throws any light on rates in detail. At the same time, it shows the fallacy of the revenue theory; their total revenues had increased that year very largely, but their cost of earning that had decreased very largely, and if they had divided it on the revenue theory, they would have been in a worse shape than they were the year before to find their cost.

Q. What road was that?

A. The Midland Valley.

Q. That is an Oklahoma Road?

A. Oklahoma and Arkansas,—Fort Smith to Arkansas City.

Q. Did you work out, investigate the matter, so as to ascertain what caused the conditions you speak of?

A. Yes, sir. A sand industry had opened up a few miles from Muscogee, and they were moving a trainload of sand per day; it meant the increasing of their revenue per ton per mile; it meant the handling of that many tons at a low revenue, which would reduce the revenue per ton per mile.

Q. Judge Hill told you in his examination in chief, that the rates of these two roads engaged in this litigation were increased in the month of January, 1909, I believe he said that——

Mr. Hill: I said the Cotton Belt.

Q. 96% increase; Judge Hill used the word "rate"; there was an increase in revenue of 96% he states; does that indicate

2994 an increase in rates to that extent?

A. Not necessarily so, and it might indicate an increase in one rate only.

Q. I see I have not stated that to you as a railroad man would want to state it—it was 96% increase in the average rate per ton per mile. Now, does that indicate a similar increase in the rates?

A. No, I don't think the average increase in revenue per ton per mile, without other factors surrounding it, would indicate anything.

Q. You would have to know the condition of the traffic?

A. I would have to know the tonnage that moved; it might be possible that the business of the road had fallen off, so that the road moved nothing but cotton, which Mr. Watson says they make six mills per mile on; if the tonnage showed an increase of 96% in addition to the increase in revenue, that would mean an increase naturally.

Q. In connection with the movement of grain, you spoke about the terminal handlings; you referred to the tonnage handled through the larger towns and big junction points where you say excessive handling charges occur; tell me just what you referred to by that statement?

A. I mean, it is cheaper to deliver a shipment to a connecting line at a little town than it is at a big town.

Q. To what class of traffic do you apply that?

2995 A. Any kind of traffic.

Q. What is its application to the movement of grain in Arkansas. Tell me what application you make of that?

A. I don't know that I applied it to Arkansas; if it did apply, it would apply to the delivery of traffic at Little Rock or Memphis to the road, as compared to some smaller station; I don't know that I used that example.

Q. I want to know if you intended it in connection with traffic in Arkansas?

A. I don't think I spoke of it in connection with grain; if you will read me the paragraph, I can judge of what I was speaking.

Q. "That is true; grain might come over one line direct, it might originate over at one station south of there and move at the same rate and move over three lines, and be handled through the larger towns and the big junction points where excessive handling charges occur." You were not speaking of the situation in Arkansas, were you?

A. I don't think I was speaking of the Oklahoma grain.

Q. Now, you made a number of statements in regard to handling cotton; you say that cotton is treated strictly as L. C. L. freight?

A. To the extent of the rates being built regardless of the quantity and that it is unloaded and loaded by the railroads.

Q. Is it treated as L. C. L. freight from an operating stand-

2996 point?

A. Inasmuch as the railroad does the loading and unloading, that is the only difference between carload and less than carload shipments.

Q. You say "that not only applies in carrying to compress points, but it applies to the shipment in its entirety."

A. The only difference I know, they will take one bale of cotton or they will take twenty at the same price; they will load one bale and carry at the same rate as they will take twenty bales, handled from a traffic standpoint.

Q. You are speaking now with reference to the application of the rates?

A. Yes, sir.

Q. Not in regard to an operating standpoint?

A. The handling of it is handled the same as L. C. L. freight.

Q. Is it handled in through trains when it reaches compress points?

A. If there was a through carload of merchandise L. C. L. in the same train, it would be handled in the same train.

Q. What does a bale of cotton weigh?

A. Say 525 lbs.

Q. How many units is there in an average carload of cotton how many bales?

A. I have forgotten those figures; I believe it is 20 some odd

into compress; I wouldn't care to state those things accu-
2997 rately.

Q. Can you state the number out of the compress?

A. Probably two and a half times as many.

Q. Can you draw an analogy from an operating standpoint, between such units as that and ordinary package freight from L. C. L. standpoint?

A. Yes, ordinary package cars out of St. Louis to Little Rock, Ark., would be loaded to break bulk, I presume, at Little Rock for surrounding territory, and it would carry, I should say, from seventy to eighty consignments anyway, probably more and probably less, and when that got to Little Rock, it would either be delivered locally or broken up and distributed out. Now, the reverse is true in cotton; cotton is handled into the compress, compressed and then sent south in solid cars; most of our cotton goes to Galveston, south; it is sent to the final point from the compress.

Q. You state that in one case there is probably twenty units, and in the other seventy?

A. Probably 70 or 80 or 100.

Q. From an operating standpoint, with reference to various kinds of service, clerical and physical and every kind of service that is rendered, can you compare those two conditions?

A. Yes, sir, a car of cotton is handled, it has to be loaded at the local station, has to be a waybill made for each bale of cot-
2998 ton; there may be four or five for the car; the waybill is surrendered after the car gets to the compress; they won't deliver it without the surrender of the original bill of lading; they require the surrender of the original bill of lading whether it is consigned shippers' order or whether it is consigned to a definite consignee, they require the surrender of the original bill of lading; the cotton is then sent to the compress, compressed and then goes back to the car; new bill of lading has to be issued; it has to go through, from an accounting standpoint, more details; the money has to be returned to the shipper; the shipment is loaded on the car, and that many expense bills taken out, and then the car is forwarded to final destination, it being only the reverse of the movement the other way; the cotton receiving its L. C. L. movement at the start, and the L. C. L. freight receiving it at the final end. Of course, I do not mean to say that it costs as much per unit to handle cotton as it costs to handle L. C. L. freight; I don't want to be understood as making that foolish statement; I am not considering the density of the carload; there is 20 units probably, or more or less, in an L. C. L. car of cotton, and 70 units or more or less, in a car of L. C. L. package freight. I believe the total rate on cotton is 2 cents per hundred pounds for loading; I believe that is generally the rate paid for loading at the compress. That is hearsay, however.

2999 Q. How does the expense of handling cotton compare with other commodities, in your judgment?

A. I think it is one of the most expensive commodities handled; that has always been my understanding of it.

Q. And do you base that upon the descriptions you have just given?

A. Partially that, and the description I gave the other day; I think the one today is part of it, and the one given the other day is part.

Q. I believe you stated that cotton was shipped to New England States from Arkansas,—we will say from Little Rock at 80 cents a hundred?

A. That is the figure I used.

Q. And over different lines of road?

A. Yes, sir.

Q. How is the rate divided for the movement of it over the different lines, between the different roads?

A. You would have to give me the division sheets covering the movement.

Q. You don't know then?

A. No, sir, I don't know what the movement is; I don't know what it is on any commodity right offhand, because there is so many division sheets that a man couldn't carry any one of them in his head, unless he looked it up just before he came on the stand; sometimes there are ten or twelve division sheets to one tariff, and it would be impossible for a man to remember them. There
3000 are three general bases of division: One mileage, one arbitrary and one constructive mileage pro rata; those are the three general bases used.

Q. Do you know what is the average per ton per mile received on cotton on the Iron Mountain or Cotton Belt Railroad?

A. No, sir, I haven't the least idea.

Q. Well under the division made by both those lines, the lines with which they connect at East St. Louis, they get 47 cents per hundred; work that out and state what they would get for their haul.

A. What is the haul?

Q. 345 miles from Little Rock to St. Louis.

A. That is per hundred pounds?

Q. Yes.

A. It figures about 24 mills.

Q. Would you regard that as unremunerative?

A. No, I wouldn't *not* regard that as unremunerative.

Q. That doesn't illustrate does it, a want of correspondence between the cost of service and the compensation?

A. No, I would say that was a good rate to the railroad.

Q. To go back a little bit, you say that railroads have to frequently send the section foreman and his gang to load cotton at a station?

A. Often.

Q. Does that apply to Arkansas?

A. I don't know about Arkansas; I testified the other day, that I testified to Oklahoma conditions only.

3001 Q. You don't know the dignity of a section foreman and section hand in Arkansas, do you?

A. No, sir.

Q. Now, what do you estimate that it costs to handle cotton and load cotton per hundred pounds or per bale?

A. That is impossible to figure that; the figures are hard to apply. I remember during the last cotton season one morning, they had to bring the section men about four miles to load ten bales of cotton, and then they had to go back to their work; now, they had to put the car up by hand to the loading platform, it was not there where they could load when they got there; they had to set the car, and as they didn't want to wait for an engine, they set it by hand; it took them some time to load it, as they had to load it from the right-of-way into the car.

Q. Do you know what the average cost of loading miscellaneous freights is?

A. No, sir.

Q. Have you any idea, per ton?

A. You mean on the cotton in Oklahoma?

Q. I will say in Oklahoma?

A. I have the figure in my office, I don't remember what it is.

Q. You have no knowledge as to Arkansas?

A. No, sir.

Q. If it comes them from two to four cents per bale in Arkansas, how would you say that compared with the cost of loading
3002 miscellaneous freights?

A. I would say that compared favorably with other freight.

Q. Would you say it costs as much as it does to load and unload miscellaneous freight?

A. I think it costs less.

Q. To load cotton?

A. Yes, if they can load it out for from two to four cents a bale.

Q. Isn't it a fact that that applies in Oklahoma as well as in Arkansas?

A. No, sir, it costs more to load cotton than that.

Q. Is it a fact that it costs less to load and unload cotton under your practices in Oklahoma than it does miscellaneous freights?

A. No, I don't think so.

Q. Have you any information on the subject?

A. Yes, if course it costs less, figuring on the handling of L. C. L. freight; the expense of handling cotton at the compress is small; they pay a very small figure to the compress for loading it; they put their own men in there, and they do it at a very small cost to the railroad.

Q. Doesn't it take a large number of packages to constitute a ton of ordinary L. C. L. freight?

A. Yes, sir, I should think it does; I should think the ordinary L. C. L. shipments would be about 200 pounds.

Q. Do you think the average L. C. L. shipment in state traffic is 200 lbs?

3003 A. I think the average would exceed that in state traffic.

Q. What would it be in interstate?

A. Something less than 200.

Q. I don't know whether I understand you; do you mean to say that packages that are peddled out in state traffic are carried in larger bundles than L. C. L. interstate freight?

A. I mean that the average L. C. L. shipment in Oklahoma——

Q. I am asking you to compare the average L. C. L. shipment in state traffic as compared with L. C. L. shipments in interstate traffic?

A. That is what I am doing; the average L. C. L. shipment in Oklahoma is a heavier consignment than the L. C. L. to Oklahoma.

Q. You mean the packages are heavier?

A. No, sir, I mean the shipment as a whole.

Q. I am asking you the number of packages, separate packages, how many do you require to constitute a ton in L. C. L. traffic in your state business, and in your interstate business?

A. I have never seen any figures on that at all.

Q. Isn't that an important feature in determining the expense of L. C. L. shipments within the state?

A. I have never seen a figure on the L. C. L. shipments made that way.

Q. Wouldn't that be a factor in considering the relative
3004 expense in handling L. C. L. shipments between state and interstate?

A. That might be a factor to be considered; the railroads have never seen fit to produce those figures.

Q. Without having investigated it, do you believe that the L. C. L. packages are broken up and are more numerous to the ton in state traffic than in interstate traffic?

A. I don't believe they are in our state. I wouldn't like to state definitely on that, but our state shipments as a rule, are pretty heavy.

Q. Do you mean the retail business and the local jobbing business out of your trade centers, is conducted in larger units than the wholesale business that consists of buying merchandise in other states and bringing it to your local trade centers?

A. I have checked freight train after freight train in our state, and the 20 and 30 and 40 and 50 pound packages of through freight from Montgomery-Ward and Sears-Roebuck and Simmons Hardware to people in our state is phenomenal.

Q. There seems to be practically a parcel trade between your state and St. Louis?

A. Between Kansas City, Chicago and St. Louis, and between Gainesville, Texas, 7 pound, 10 pound and 20 pound packages and from Kansas City and Fort Smith.

Q. You have a joker down there?

A. I didn't mention the commodity Judge.

Q. That produces a condition that would not exist where
3005 that trade is not carried on.

A. That is part of our business; I presume that the same thing exists in Arkansas, and that Simmons-Hardware and Sears-

Roebuck ship to Arkansas; I know the condition exists in Texas, as I have checked it going to Texas.

Q I understand it is not done very much in Arkansas; if that is correct, that would make a difference?

A. Yes, sir, I presume if it is in evidence, it would speak better for itself.

Q. Coming back to the cotton, you don't know how cotton is handled with reference to loading and unloading in Arkansas, or was in 1907?

A. No more than general information as to how cotton is handled everywhere.

Q. Do you know at what points on the Iron Mountain road and Cotton Belt road, the compresses are located?

A. No, sir.

Q. Have you any knowledge as to the extra expense occasioned by extra switch engines that are employed at compress points in Arkansas on those two roads?

A. Not specifically; I was speaking generally, not as to specific conditions.

Q. Tell me about this batting of cars, how is that done?

A. Nailing strips on the outside of the doors to keep fire from getting through.

Q. Did I understand you to say that material is thrown away?

3006 A. It generally is.

Q. Do you know whether that is done in Arkansas?

A. There are general instructions out to return that material but the percentage that is returned is small.

Q. It is not a very large item of expense?

A. No, it is very small; it would amount to 20 or 30 cents a car, I imagine.

Q. Do you know of any instance of 500 cars of cotton lying in the yards and compress points in Arkansas for twenty or thirty days?

A. No, sir, and I didn't intend to make a statement that at any point 500 specific cars loaded with cotton were in a yard for 20 or 30 days; I mean that 500 cars were in there between those days, and I used that to show the trouble in switching a car; there might be 20 came in and 20 go out, or 50 in and 50 out in the day. I didn't mean to intimate that any specific 500 cars or any number of cars remained there any particular time, but that condition was there.

Q. You said you had seen as many as 500 cars laying there, some would be there ten or fifteen or twenty days?

A. Yes, sir.

Q. Do you mean by that that you have seen 500 cars at one time?

A. Yes.

Q. Constantly there for any length of time?

A. Not in Arkansas.

Q. You know nothing about the conditions in that respect
3007 in Arkansas?

A. No, sir; we had a blockade in Oklahoma at all our compresses when I saw that condition.

Q. You stated further that every time the cotton was called for, it generally required the switching of every car.

A. Generally speaking.

Q. You mean to say that if there were 500 cars in the yard, every one would have to be switched?

A. I mean that you might have to switch ten cars or all of them; there is no way to set those cars first out; you may pick up just one car, and you may have to go through all the switches to get out one car; it is just a case of accident as to where you get it.

Q. In your language, you didn't intend to make these statements as strong as the language I have called your attention to?

A. Not in the sense you have taken it. I did not mean that a general switching of the yard was necessary at all times.

Q. Then you say again, after the cotton is moved to the compress, it is again put back in the car and the same process gone through with again, what do you mean by that?

A. Batting of the doors I presume, or loading it by hand.

Q. In view of your impression as to the extent of the service to be rendered in handling cotton, what is your view as to the relative expense of handling cotton as compared with, I will say, grain
3008 or lumber?

A. I think either commodity is handled much cheaper.

Q. You think grain and lumber is handled cheaper than cotton?

A. Yes.

Q. Do you know the average rate per ton per mile on those commodities?

A. Where do you mean?

Q. In your own state?

A. I have practically the figures, yes, sir.

Q. What is the number?

A. If I remember, grain average is about six and a fraction mills; and the lumber something less.

Q. That is about what is testified to in this case? What is the average revenue on cotton per ton per mile in your state?

A. About 20.

Q. How does the difference in those rates correspond with the difference in handling the three commodities?

A. I think the expense of handling cotton in my opinion, is much greater than the handling of grain or lumber, but I think that cotton is a more remunerative commodity to the railroad than is grain or lumber, if that is the answer you desire.

Q. How is the expense of handling cotton, how does it compare with the expense of handling live stock?

A. It is greater handling cotton than it is handling live stock.

3009 Q. What is your rate on stone and coal per ton per mile in Oklahoma?

A. You mean state business?
Q. Yes.
A. You will have to tell me whether you want the commission rates or railroads' rates.
Q. Railroads' rates.
A. Stone is handled in Oklahoma by the Frisco at a rate of less than 5 mills per ton per mile, part of it; stone is handled by the Santa Fe, I am speaking of where most of the stone moves, at the rate of approximately six mills per ton per mile.
Q. How does the cost of handling stone, taking in consideration the risk and everything, compare with the cost of moving cotton?
A. There is no consideration between them; stone costs nothing as compared with handling cotton.
Q. Five mills of stone against, I believe you said, 20 mills for cotton; don't those rates pretty well represent what you testified about the relative cost of handling those commodities?
A. I think they do.
Q. Doesn't it follow that whether the makers of those rates intended it or not, that they did accidentally—we will assume that there was no design connected with it—got somewhere near, in adjusting the rates, to the rates that existed in the cost of moving the articles.
3010 A. There is no doubt in my mind that they were getting at the relative cost between the two commodities, of moving them, but I don't think they did figure the cost of service in there by any means; I think the stone rates are entirely too low.
Q. Has your Commission raised it?
A. Yes, sir; the result of the stone tariff which was injoined was that——
Q. Never mind about that; you are talking about rates in Oklahoma, you don't know anything about the rates in Arkansas?
A. Generally yes, specifically probably no. I have made some comparisons on your Arkansas rates.
Q. Could you tell me now the Arkansas rates on those commodities which I have been talking about?
A. I have them; I would have to look it up; I remember these two rates because they were specific rates.
Q. I want to call your attention to some little difference between your understanding, and the difference between Oklahoma and Arkansas. I believe you said that cotton is always loaded at shipper's count, and sealed after the doors are closed; you are speaking about the practice in Oklahoma?
A. Yes, sir.
Q. Do you know what the practice in Arkansas is?
A. No, sir.
Q. The methods that prevail in Arkansas in the matter of handling and conducting their business, from an operator's stand-
3011 point, would not be known to you?
A. No.
Q. You don't pretend to have a knowledge in that respect?
A. No.

Q. You undertook to describe the manner in which a train is broken up at a terminal division point; you are not speaking from your knowledge of the manner in which trains are handled on the Iron Mountain road or Cotton Belt road, in Arkansas, are you?

A. Not to be able to swear what was the specific policy, no sir, but I know it is the general policy, and from reading the rules of the Missouri Pacific Railways, I would think that that is the manner in which it is handled in Arkansas.

Q. But all you know about it is your general knowledge and then the information you might have acquired from reading the rules?

A. Yes, sir.

Q. What rules do you refer to?

A. Red Ball rules.

Q. Where did you find them?

A. In the Missouri-Pacific's book of instructions.

Q. Have you got them before you there?

A. Yes, sir.

Q. Let me see what you refer to please?

A. "Instructions governing the movement of Red Ball and Green Ball freight; also schedules in brief, showing through con-
3012 nections, and the time between various Cities."

Q. Show me the rule which you speak of as having a relation to the movement of through trains?

A. One rule here is Rule 5, page 7: "Any Red Ball or Green Ball car set out or left over, becomes at once a preference car for its class, which fact must be indicated on way-bill by attaching form 3407. Should it become necessary to reduce a train in which this car is again moving, it must not be cut out a second time if in good order."

Here is another rule: This book also shows what is redball and greenball freight, listing the different commodities: "Red Ball or Green Ball freight loaded, or received from connections, at an intermediate station, destined to through points, must be moved to the nearest division terminal, and forwarded from there on first train of proper classification. Superintendents should arrange for this movement on their divisions."

That carries out what I stated with reference to handling cars into terminals where they were put on through trains, showing that the local is the work train for it. (17) "Red Ball or Green Ball freight destined to intermediate stations must be moved in trains of proper class to the nearest division terminal. Red Ball or Green Ball freight received or loaded at terminals for local points must bear Red Ball or Green Ball cards to destination. For
3013 movement of such freight between points on same division, the train which will get it to destination promptly will be considered proper train. Superintendents will arrange for such movements on their divisions." (18) Trainmasters must keep informed of the movement of Red Ball and Green Ball freight over their respective territories, and will be held responsible for delays to such freight occurring under their jurisdiction.

And Miscellaneous Instructions, on page 10, which covers the

handling. Those are some of the rules that I have read. I read those to find that the general line of handling that traffic is the same as it is in our state and apply that to other conditions. I want to add to that answer that naturally as any man would before testifying in a case of this kind, I made a trip to Little Rock, trying to familiarize myself with the rules of the Railroad Company, and conditions existing, as best I could, and I have spent considerable time with witnesses for the state who have made these examinations, and I am advised that testimony will be put in this record before the case is closed, that will show the average time that cars going through the state are delayed in the state, is approximately six days instead of 28 hours as the schedule shows they should move, and taking these things into consideration, I think the movements are the same as they are under other general conditions.

Q. When did you make a trip to Little Rock?

3014 A. When the case was set here for the last hearing, about two or three weeks ago.

Q. How long were you there?

A. All of one day and part of another.

Q. So your personal knowledge rests on an investigation made in a day and a half?

A. Yes, sir, there are three days I have had here with the experts of the state.

Q. That is not personal knowledge?

A. No, sir, that is only getting a knowledge of the facts, and asking questions with reference to different conditions that a man could testify to, without testifying from generalities; that was all I cared to know; I was not looking for specific instances.

Q. You undertook in your examination in chief, to describe the movement and handling at division terminals and other places of through trains; you say a train will start out from Kansas City or St. Louis or some other point, with all Red Ball freight, that being the highest class of freight the railroad handles, that there is in the yard, and if there is not enough there in the yard to make out a Red Ball train, they put in Green Ball or anything else to make up their tonnage, where did you get that information?

A. From that little book.

Q. Just point that out to me.

A. Rule 14, at page 8, "Red Ball trains must not handle Green Ball or ordinary cars, except when necessary to fill out, and

3015 such fill-outs will in no way affect the classification of the train. It shall still be a Red Ball train." We understand from "fill-outs," if there is not sufficient Red Ball tonnage, they will carry Green Ball first and ordinary freight second, in order to fill out their tonnage rating.

Q. Does that relate to the making up of Red Ball trains at the place where it originates?

A. Yes, sir.

Q. Are you familiar with the *manner in which the* classification yards of the Iron Mountain Railroad at Dupois, opposite St. Louis.

A. In what way do you mean?

Q. Do you know anything about the classification of freight there?

A. No.

Q. Do you know anything about the manner of conducting the business?

A. Not a particle.

Q. Do you know how cars that it may be necessary to detach from Red Ball trains are arranged in the train, whether any arrangement is made with reference to convenience in handling the business?

A. If they are obeying the rules, I know how they are handled.

Q. What do you find in the rules?

A. Rule 12, "Unless specially authorized, all Red Ball and Green Ball trains must be switched in station order at the initial
3016 point, cars without air brakes, and cars to be cut out en route in the rear. When fill-outs are required, place next to caboose. Cars picked up en route must be put in proper place in train."

Q. What is the purpose and effect of that rule?

A. It means that when a car has to be set out, it has to run up to the station, and either set its own cars out or have a switch engine come on behind it and set it.

Q. What switching movement is involved in that?

A. At least four switches.

Q. I don't know about the number of switches, that is as simple a movement as can be made in moving the cars from one train to another?

A. That is true.

Q. It simply means to detach that car, take it off from the part of the train in which it is placed with reference to convenience in switching, and leave it at some other point?

A. Yes, sir, and that is where I think terminal expense comes in on that train; that switch engine has to do all that switching, put that in that particular order for the Red Ball engine to handle.

Q. What is the character with reference to state, interstate or trans-state of the contents of the car that is switched out of the Red Ball train usually?

A. What is the character of the contents?

Q. A Red Ball train represents, as I understand, a train
3017 carrying through freights to different points?

A. Certain classes of through freights.

Q. Would you say that trans-state freights shipped from St. Louis south, are moved in Red Ball trains?

A. Some classes are and some are not.

Q. We will take merchandise?

A. All L. C. L. merchandise would be in there.

Q. That would be in Red Ball trains?

A. Yes, sir, so would the interstate having a destination in Arkansas.

Q. And trains are made up usually, as far as it can be done, are

they not, of cars conveying the same character of tonnage, is that true or not?

A. Preference being given to the most highly perishable, or highest grade Red Ball freight.

Q. A car attached at St. Louis to a Red Ball train going into Texas which has to be set out at Little Rock or at Hoxie in Arkansas, usually doesn't carry trans-state contents, does it?

A. A car hitched onto a Red Ball train made up at St. Louis?

Q. Made up largely of cars going to the State of Texas, which has to be detached?

A. Usually that is the intention.

Q. That switching expense you spoke of is in detaching Arkansas freight from trans-state trains?

A. Yes, sir, it might be that.

Q. Assuming a movement of that sort?

A. Yes, sir, it would be.

3018 Q. I understand that there may be an accident, a car now and then which will disarrange the service and cause some extraordinary expense, but I am speaking of the regular make up of trains or the regular movement?

A. Wait a moment, that is not the only thing they detach a car for, they might detach a car at a junction point, say at Ft. Smith for an Oklahoma station, which would be entirely an interstate shipment, but it would be an expense on Arkansas, for which Arkansas would receive no revenue.

Q. I understand that, but in cases where cars, we will say, Green Ball or local freights or freights destined for the State of Arkansas are included in the train, the handling of the cars growing out of that condition, is for the benefit of Arkansas freight, isn't it?

A. If it is Green Ball freight that is entirely for Arkansas, yes, sir.

Q. To what extent do railroads attempt, in making up trans-state trains, to avoid mixing them up with local cars that will have to stop in the State of Arkansas, if the tonnage is mostly going to Texas?

A. They put their regular package merchandise cars for Arkansas, and highly competitive Arkansas cars on a train with Texas freight, just the same, because that freight is just as valuable to them as the other, and it is as highly competitive as the other, and they would show no preference of handling Texas freight over Arkansas freight or Arkansas freight over Texas freight.

3019 Q. Do you mean if there were cars enough to handle a train to Dallas, Texas, and there were additional cars going to Arkansas, they would put the Arkansas cars in the train going to Texas?

A. They would make two trains.

Q. And they wouldn't attempt to put all the Dallas cars in one train?

A. They would attempt that, yes.

Q. That is what I mean——

A. From information I have received, I judge they don't do that, for the simple reason that if all cars of trans-state freight passing

through Arkansas have an average delay of approximately six days in Arkansas, it certainly indicates that they have not handled those cars on trans-state trains.

Q. Doesn't it resolve itself into this condition, a train made up of partly trans-state traffic for the south, possibly it has some cars for Arkansas; when they reach the division point in Arkansas with those cars, they simply detach them and take them off that train, and the trans-state business then goes on to its destination; isn't that the movement that is outlined, in so far as it is outlined at all?

A. Yes, adding other cars to the train.

Q. Adding cars which may properly be carried in that class of train?

A. Yes, sir in order to fill out their tonnage.

3020 Q. They want to economize as much as they can by using to the extent of their power; that is a matter of economy?

A. Yes, sir. I have watched the operation of trains in Kansas, Missouri, in Texas, in Colorado, and New Mexico, and I have spent a large part of my time in watching the operation of trains in Oklahoma, and I fail to find that there is any difference materially between the operation in one place and the operation in another, as every general superintendent desires to get the best means of handling his trains that anybody else has, and I think conditions that exist in one state can generally be said to exist elsewhere.

Q. Did you ever work in the operating department of a railroad?

A. Only while I was with the division superintendent, and to a certain extent while I was in the motive power department.

Q. Did you participate personally in handling of trains?

A. Yes, sir, when I was with the division superintendent, I had charge part of the time, of the quick dispatch of trains; I assisted in making up the time card, and I assisted in cleaning the yards out of old freight, and I spent many an hour on the switch engine picking cars out of the yard and making up through trains.

Q. Your duties were mostly discharged in the office, however, were they not?

A. Three months of my time and may be longer, I spent with the superintendent of machinery, and my time was spent almost

3021 entirely on the road; I was never in the office only to write out reports.

Q. How many months were you with the superintendent of machinery?

A. Over a year altogether.

Q. How much of that time were you on trains?

A. I think about five months; it is hard to remember those things.

Q. How long were you with the other man?

A. I had three months on the road continually with him?

Q. Tell me what your position was, in connection with the operation of trains on the road?

A. Simply doing whatever he told me.

Q. That was the handy man work?

A. That was when I was with the division superintendent.

Q. If he wanted something done, he would send you out to do it or have it done?

A. Yes, sir, and I would often be out for a week without seeing him at all.

Q. I want a little fuller description of the duties that you discharged when you were sent out by the superintendent?

A. There would be a blockade—I remember we had a blockade in what was known as the Sialo yards, and I was sent there; I was there five days in cleaning that blockade up; cars had come in there so they couldn't get a train through the terminal. Again,

3022 when I was commercial agent at Terrion, the transportation department called upon me to help clear that blockade, which I did; I worked there, I think, for two weeks.

Q. It was in cases of that kind, you would be sent out in emergency?

A. Yes, sir; I assisted in watching trains; I used to ride locals all the time, see that the agents were properly loading their L. C. L. freight, see that the conductors were quickly handling it, yardmasters were making through trains in station order, and see that the work was properly done on the lines.

Q. The experience you gained in connection with cleaning up this blockade did not represent normal conditions, did it?

A. Not entirely so, no.

Q. That was on that line down in Mexico, was it?

A. Yes, sir.

Q. What kind of road was that in point of construction?

A. It was as good as the average line in Oklahoma, 3600 miles of track.

Q. How was it compared with the Iron Mountain or Cotton Belt?

A. That part of the Iron Mountain line which I have been over in Oklahoma——

Q. That part in Arkansas?

A. I don't know that part of Arkansas.

3023 Q. You said you understood that it would be shown in this case that there was a very great delay in the movement of trans-state trains in the State of Arkansas: to what period does that relate, do you know?

A. I did know, Judge, but I cannot recall it now. I simply know——

Q. Is it not a fact that your impressions—the impressions affecting your testimony in this case—are derived very largely from the impressions you gained in talking with the parties, from whom you obtained that information?

A. No, sir, I have my general experience, backed up by the conditions in Arkansas, which I have taken from these men who have been down there.

Q. So, your impressions in regard to the conditions in Arkansas, are based upon information that you obtained from others, in the manner that you have described?

A. Where they differ from general experience, yes, sir, but they differ slightly from my general experience in such matters.

Q. Did I understand you to say that this very high terminal expense that is connected with the movement of this class of trains we are talking about now——

A. Very high terminal expense?

Q. Yes. How does it compare with the terminal expense to state freights?

A. No difference whatever.

3024 Q. You think not?

A. Not for the amount of work performed.

Q. How would it compare with the switching that is necessary to make up a train to carry state tonnage from some division point and peddle it along the road?

A. There is not a particle of difference. The switching engine goes into its yard to make up a train—you take a classification yard—take Little Rock yard, as an example: I can see no reason why there would be any difference with a switch engine going in there to make up a local or red ball train; he has to take those cars anywhere they may be located; he has to take them all over to a making track, if he has one, and in classification yard he would have one. He is making that red ball up just the same as——

Q. Tell me the relative expense as between trans-state freight and state and inter-state freight.

A. There I agree with you; there is considerable difference in expense.

Q. What does it consist of?

A. The trans-state train would not be handled anything like as much in the trans-state, as state or interstate.

Q. What is the difference in terminal service as rendered each class?

A. The mere making up of the train and putting it together again is the total expense of the trans-state, presuming the car had

3025 been weighed before it came into the terminal; while with the state freight they would have to break that train and in addition deliver that car to wherever it was going—to some private switch track, housetrack, or to the team track.

Q. Mr. Bee, is it necessary to break up the arrangement of the trans-state cars on a red-ball train?

A. No, not exactly break the arrangement of it entirely. They cut out the cars from the back.

Q. Assuming that a train arrives at Little Rock with 25 cars: 20 of them contain merchandise going to Tyler, Texas; the rest contain green ball, going to the State of Arkansas;

Now, what has to be done—tell me what switching, if any, is required to be done for those trans-state cars at Little Rock.

A. None of it is red ball traffic? Let me understand.

Q. I do not understand your fine distinctions there, but 20 cars go to Dallas, Texas, and 5 cars in that train will be detached at Little Rock to go to other places.

A. If that train is made up according to instructions, Judge, the first 20 cars are red ball we will say, and the next 10 cars—assuming

the train is carrying 35—are green ball, while the next 5 cars are ordinary freight:

If that train has no red ball for Arkansas, and no green
3026 ball for Arkansas, and merely one of these five ordinary cars for Arkansas—the switch engine would run in and take that one green ball car out, set the train back again and go on. But if one of those red ball or green ball, and all of the five ordinary cars were for Arkansas, it would require that they take all the train, including that first red ball train, kicking that train out and putting that part back on the train again; that is, kicking the green ball out and put that part back and then set the ordinary freight out. Now, we have set out seven cars of that train. They have got to fill up. Probably their filling up will include three cars for Galveston, or one for Galveston, one for another point and one for another point; they must set those cars in at the exact spots they belong and it means the breaking up of that red ball train to the extent of setting those cars in their station order, if the rules are complied with.

Q. So then, those cars from the time the train leaves St. Louis are put together in station order?

A. They are supposed to be.

Q. If that is true, the Tyler cars will all be together and so arranged that it is not necessary to break up their solidity in the train for the purpose of getting thes cars out?

A. No, sir.

3027 Q. So there is no moving necessary except to attach and detach?

A. Yes, sir.

Q. And the extent of the switching depends on the number of cars to be taken out and put in?

A. And the destination of the cars that are to be put in.

Q. If there is a car or more going to Galveston they would put them in there in the order of the station it is going to?

A. Exactly.

Q. Is not that the most expensive form of terminal service, Mr. Bee, that is known in railroad service?

A. I would not call it the most expensive, for this reason: that the switch engine is delayed while it is performing that service at the main line, or main passing track, while that service is being performed, and it means a delay in that yard——

Q. Let us divide it up and first consider it with reference to the service rendered to the trans-state freight on that:

Confine yourself to that; is not that the most expensive class of terminal handling? Leave out now the consideration you mentioned a moment ago?

A. I cannot see that it would be the most expensive. There
3028 may be a car which is all trans-state and destined to an Oklahoma or Louisiana point, over one of the other branches. That car must go through the same experience in the yard that a state car would go through after it is loaded and pulled in.

Q. Leave that out at present and take the fifteen or twenty cars going to Texas.

A. Then there is very little service performed, but the class of service is just as expensive for the length of time as the other service.

Q. It costs just as much to switch a car fifty yards for a trans-state as for state?

A. Yes, sir.

Q. Referring to your suggestion that the car might be going to some other trans-state point and that car, like the rest of the cars, would be put there in station order, would it not?

A. Yes, it would be put in in the Little Rock station order.

Q. It would not be put in between two Texas cars?

A. Oh, no. It would be the Little Rock station. It would have the same service performed upon it as any other car in the yard. It would be pulled out of the train and kicked over into a passing track, or any place to get rid of it. It would then probably mill around in the yard until they could redball up the train that was going
3029 out that it would go on. It would be switched backwards and forwards into its proper place on that train. There would be no special switching for that car, but it would receive the general switching that the other cars would. It might be handled once or twenty times until it was finally located in its proper place in the train.

Q. What would be the occasion or necessity of handling it twenty times?

A. They might have a bunch of cars behind it——

Q. It might get in the way——

A. Until it was finally gotten into its proper place. I said once or twenty times as to the average; I would have to know the train and see the switching.

Q. I take it that all intelligent operators of railroads devise some system or method by which the greatest economy in the handling of traffic of that character can be obtained.

A. Yes, sir, and if they have a yard large enough they would have a track over; we call No. 3 lead or No. 4 on which trains of this branch would be made up, and that car as soon as the switch engine kicked it out and made its tran-state trains up so it could go on, they would take it on its proper track and there it would lay until——

A. The Arkansas traffic has no interest in the way in which trans-state cars are arranged after they pass through the operators of Arkansas?

A. No, sir, none whatever.

3030 Q. While you were in Little Rock did you see any switching done upon the main track?

A. No, sir, I did not go into the yards at all.

Q. You do not know what the facilities and arrangements there are?

A. No, sir, the same switching backwards and forwards of course——

Q. Do you know whether they have a classification yard there or not?

A. I think they have, Judge, but I cannot say positively. I have seen a list of the classification yards. I paid very little attention to it.

Q. Just one more word on that subject, Mr. Bee: are those matters that you have been describing in detail what you meant by "highly expensive terminals" and "highly expensive terminal services"?

A. To a certain extent. I think where you got that idea—I think you misunderstood me. Where I used this highly expensive terminals in the sense you are now taking, it was a question Judge Hill asked relative to freight East of defined territory and going to Arkansas or Texas, and I said that freight would pass over a number of lines and would pass through these highly expensive terminals mentioned—Kansas City—and stated that I understood the cost there was four dollars and some odd cents to switch from line to
3031 line; that was where I drew special attention to that.

Q. That is not an expense into Arkansas?

A. Not unless the business is destined to Arkansas.

Q. Would it in that case?

A. That is an expense that has to be borne by that traffic.

Q. Is it chargeable to Arkansas in any way?

A. Not to Arkansas. It is chargeable to traffic that passes through.

Q. I see here something about citrus fruits passing upon the red ball trains: you said that that traffic affords a very slim revenue to intermediate lines because the originating line—I think you mentioned the Southern Pacific—would require a large share of the charge for its transportation and the line which handled it at the other end would also want a good share and there would be little left.

A. That was a shipment destined to Washington or New York City, if I remember correctly?

Q. Do you know on what basis the revenue of handling shipments of citrus fruits is divided between the lines?

A. No, sir, I do not; not specifically. But I should imagine the Southern Pacific would ask for a little more than a mileage pro-rate.

Q. How are you prepared, then, Mr. Bee, to state that the revenue of the intermediate line would be very small as *as* compared
3032 with the end lines?

A. If you will remember the question, Judge Hill put to me, he said, if the red ball from the coast to Little Rock and to New York or Washington was the same—he asked me to compare the two, and that is when I said on the shipment to Washington, the rate on the intermediate line would, in my opinion, be small, because I presumed the originating line would ask for better than a mileage pro-rate, and the delivering line would get that much or better. But even if they did not, and it was divided strictly upon a mileage pro-rate and that shipment moved through South via the Southern Pacific and came over the Missouri Pacific, and then went East over other lines, on the same rate that applied to Little Rock, unless the Little Rock rate was an outrageously high one, the revenue accruing to any line would be exceedingly small.

Q. This is not an important matter, but I call your attention to it because you have made statements, I think, wholly upon wrong impressions:

My information is that the lines East of the Mississippi River get sixteen percent of the charge. The remaining eighty four percent is divided on the basis of forty nine percent to El Paso. The rest to the intermediate line:

In view of that fact, would you say that your statement as to the division of that revenue is correct?

A. Yes, sir, because that only leaves 35 percent of that
3033 revenue to be divided between El Paso and the Mississippi River. You said 49 percent of——

Q. I will say now 49 percent of what was left: put it on that basis.

A. That would leave less than 43 percent accruing to the lines from El Paso to the Mississippi River. If 43 percent of that rate had to be divided to—I do not know how the Missouri Pacific got that——

Q. How does that compare with the proportion of the distance from Los Angeles to New York?

A. It would appear to compare favorably, but it must be taken into consideration that the rates East of the Mississippi River are very low compared with the rates West of the Mississippi River. The very fact that they take only sixteen percent of that rate shows that and I want to say right there, that my statement that the line that originated the traffic would demand an excess, shows it when the line to El Paso demands 49 percent of that rate—49 percent of the rate from point of origin to the Mississippi River.

Q. Is not the distance from El Paso to Los Angeles shorter than the distance from El Paso to St. Louis?

A. Not the way the shipment would be handled, no, sir. If the shipment was handled by the Rock Island it might be, but in connection with the Missouri Pacific it would not be.

Q. How large a movement is there of citrus fruits?

3034 A. I do not know that a single car ever moved.

Q. You have not had much to do with this case then as to——

A. I do not know of it; I am simply answering questions that have been put to me. Citrus fruit has to move over some road, but whether it moves that way or how it moves—the Southern Pacific gets part of the business, certainly.

Q. You say that that is carried through terminals and through highly expensive terminals?

A. Yes, sir, it is.

Q. State the exact meaning now of that expression with reference to the expense of moving citrus fruits.

A. I was talking about the terminals it went through. It originates at Los Angeles——

Q. I want you to explain what you mean by the effect of those heavy terminal expenses in the transportation of citrus fruits. I do not understand it.

A. I mean that citrus fruit moving from Los Angeles to Wash-

ington or to New York City, would be one of the commodities they would move through the heaviest and most expensive terminals. That fruit would originate at Los Angeles, where a heavy terminal is charged. It would move through El Paso where I know the terminal rates are exceedingly high. It would probably move to San
3035 Antonio, where again the terminals are high. I do not know whether the I. & G. N. would get it there or not, but if she did she would bring it up to Texarkana, I presume, or to the connection with the T. & P. The Missouri Pacific would likely handle it to St. Louis, again through expensive terminals, crossing the bridge; then through all the Eastern terminals, which are expensive.

Q. Who bears all that expense?

A. The railroads that own the terminals.

Q. Arkansas would not have much to do, then with the terminals in St. Louis, El Paso and Los Angeles?

A. Not a thing that I know of.

Q. What terminals are in Arkansas at which a heavy expense would be incurred?

A. I presume Little Rock.

Q. You were also mistaken in referring to this subject, were you not, in your statement that the Arkansas lines would require their revenue in the case of the shipment of citrus fruit on a mileage scale?

A. I presume they do. That is my presumption, figuring the rate was divided on that basis.

Q. That was your presumption? You did not know that?

A. I did not. I still presume they get their pro-rate from a mileage basis between the lines East of El Paso and West of the Mississippi River.

3036 Q. Is it not a fact that your statements in that connection were simply based upo*m* impression without actual knowledge?

A. That is true. I have said so. The tariff and division sheet, Judge, is the best authority. I am simply stating what I presume to be the case, and if it is different, the tariff and division sheet can be introduced and show that my impression is wrong. I stated at the start, Judge, that I did not care to specify any specific rates extending to or through Arkansas, and I should not be asked for it.

In illustrating additional service in the way of a longer haul that would be required to Texas common points for the same rate of compensation, you stated that the difference between those common points, referring to the first one South of Texarkana, and Big Springs as the other one, was six hundred miles.

A. No, sir, I said I figured a difference between the common points of 662 miles, but I did not say between those two specific points.

Q. "Take two points originating at St. Louis handled over the Iron Mountain, one destined to the first station in Texas, on the T. & P., South of Texarkana or West of Texarkana, the other destined to Big Springs, which appears from this map to be the end of the

common point territory. The distance between those points is in excess of 600 miles."

That seems to be your former statement.

3037 A. I did not mean to say that. That was an error.

Q. Did you look that up before you made that statement?

A. That was an error, Judge.

Q. What is the distance?

A. I tried to get the map the other evening, to measure that. I had it in mind and then forgot it. I did not intend to give any distance from there whatever.

Q. Your testimony to that extent is in error?

A. Yes, sir, to that extent. I did say I had figured the distance between the common points and found one of 662 miles.

Q. How many connecting carriers would participate in the transportation of commodities from Pittsburg to Texas?

A. Oh, I guess a man could figure out a route with six, seven or eight carriers participating in it. I think three or four.

Q. Do you remember what you stated in your examination in chief?

A. No. A man could pick out any number of carriers he wanted.

Q. Here is what you said on that: "A man could pick out routes that would apply to fifteen carriers. If a man took all day to find a route."

You say at one place four or five, and in another you say probably six.

A. I said it could be that many. Those routes are apt

3038 to be a short line. You can start it out of Texarkana and give it to one line and another all the way down.

Q. Is not the usual shipment of shipments of that sort that pass over the Iron Mountain and Cotton Belt via the Pennsylvania into Texas, constituted by three——

A. I would say four. Some other line would probably have a part of that business; deliver to the Vandalia.

Q. That is a Pittsburg line?

A. It might not. Those agents are pretty busy. I would say four, two East and two West. You can take one of those little lines in Texas——

Q. But I want to know what was the source of your information concerning this? Whether you were speaking advisedly when you said five or six.

A. I think I said four——

Q. No, you said five. You said the average would be four or five.

A. That is what I say now; four, or possibly five; not three.

Q. This is the point to which I want to call your attention: Does the increase or multiplication of the lines handling the shipment affect the reasonableness of the rate of the cost of service?

A. Yes, to a certain extent, I think so.

3039 Q. Then, that is a very material matter, is it not?

A. I think the number of lines handling a shipment materially increase the——

Q. It is not likely that it would exceed four?

A. I should say four and possibly five, Judge. It could be handled on three lines. I do not like to be in excess, but I should say four or possibly five.

Q. What would be the occasion of a shipment originating at Pittsburg on the Pennsylvania Lines going—upon any other line than the Pennsylvania between there and St. Louis?

A. A good soliciting agent.

Q. But, Mr. Bee, the Pacific Company controls lines to East St. Louis, does it not?

A. That is true enough and the Pacific lines would accept that business at other points than Pittsburg.

Q. I am taking Pittsburg, though, and the territory reached by the Pennsylvania.

A. Let a shipment originate at Pittsburg, where the Pennsylvania or some subsidiary line would accept that at other points, and a good soliciting agent would solicit a part of that for his own line.

Q. The Pennsylvania Lines have continuous lines to East St. Louis; the Iron Mountain or Cotton Belt have a continuous line from St. Louis to Texarkana——

A. Yes.

Q. —and there they connect with Texas lines——

3040 A. Yes, sir.

Q. —that reach this common point territory?

A. A large part of it. If it was destined to the Santa Fe it would probably have to be handled by some other line in Texas and given over to the H. & T. C. or some other.

Q. The division point of the Mississippi River would be the same, without regard to how many lines handle it through Pittsburg to St. Louis, would it not? Do you know about that?

A. The divisions East and West are the same.

Q. Without regard to how many lines?

A. But the question North and South, West of the river, would be a different proposition according to what I understand. Probably the Missouri Pacific have an arbitrary figure that they would take up to Texarkana and let the lines South divide the balance. Those are tariff conditions, Judge, that I would much prefer you would not ask me about. It is easy for your people to hand you the tariff.

Q. I want to ask you if you went into that on your direct examination——

A. I asked you at the time if you wanted specific instances.

Q. I am trying to ascertain to what extent you were informed in regard to these matters. Do you know the basis of division from Cincinnati points to Texas common points?

A. No, I do not know.

3041 Q. Those are factors used in making that division of rates, are they not?

A. Absolutely so, and I was giving the general conditions under which the rates were to be divided. When specific conditions are inquired into you can furnish me the tariff so I can give it to you.

Q. If it is true that there is a flat rate, an arbitrary, from Cin-

cinnati and Cincinnati points, and from Pittsburg and Pittsburg points, to St. Louis, it is immaterial in that territory whether freight is trabsported over one or three or four lines.

A. It is immaterial to the lines West of the River.

Q. That is what I mean, these lines engaged in this controversy.

A. Yes, but where one line would handle it East of the River there would be three and maybe more handling it West of the River.

Q. What are the three lines that would handle it West of the River?

A. With the I. & G. N. it would have to go through the T. & P. if it was going through the H. & T. C.——

Q. I understood you to say it would have to be handled by at least three lines.

A. No, sir, two or three; probably three. It would be three if the Missouri Pacific was handling it.

3042 Q. What has been your experience in working with a system of rates from St. Louis to New Orleans and from St. Louis to Little Rock?

A. I have not worked with those rates except a general comparison.

Q. Have you had occasion to quote them?

A. I may have quoted those rates in the past; from St. Louis to New Orleans I quoted numerous times.

Q. Have you from St. Louis to Little Rock?

A. Never knowingly. I may have, but I do not remember.

Q. You stated in your examination in chief, as I see your testimony before me, that you had seen the rates and had had occasion to quote them; referring to those two classes of rates.

A. I meant the St. Louis-New Orleans.

Q. You do not mean that that applies to Little Rock rates?

A. I quoted the St. Louis-Ft. Smith rate on numerous instances. I worked with it and compared it, and I presume I compared the St. Louis-Little Rock. I know I did in cases that I had.

Q. Mr. Bee, I think you stated yesterday—I am not referring to your testimony, I am speaking from memory, that there was a condition existing at Ft. Smith which enabled it to encroach upon the commercial territory of Muskogee.

3043 A. Yes, sir. It is not existing, but did exist.

Q. Did you say that that grew out of river competition?

A. I said in my opinion it grew out of so-called river competition.

Q. Why do you think that, Mr. Bee?

A. Well, because railroad men told me those rates were made on water competition.

Q. Do you know what they really are based on?

A. No, I do not know what any rate is based on except what I am told by the man who makes it.

Q. Is not the Ft. Smith-Little Rock rate plus a differential?

A. I presume it is.

Q. Is not the Little Rock rate the Commission rate from Memphis plus the bridge arbitrary?

A. That I do not know.

Q. If that is true, and I think it is in evidence in this case that that is the basis of it, are you not mistaken in saying that so-called river competition fixes the Ft. Smith rate and enables it to encroach upon the territory of Muskogee?

A. Do you mean the St. Louis rate to Ft. Smith and the New York rate to Ft. Smith is made by a differential over Little Rock, which is made by the Commission——

Q. I mean this: that in effect the Ft. Smith is the Little
3044 Rock rate plus a differential; the Little Rock rate from Memphis is the Arkansas Commission rate plus a bridge arbitrary. The St. Louis rate is that plus thirty cents and then East at other central points it is differentials in different amounts—New York one, Pittsburg another, and Chicago another: that is the way those rates are built up.

Mr. HILL: Are you referring to class rates or commodity rates?

Mr. MOORE: I am referring to first class rates.

Q. What I ask you is this: can it be correctly said that water competition fixes the Ft. Smith rate in view of those facts?

A. If you say that the New York rate is made on a differential——

Q. I do not say the New York rate: I am talking about Pittsburg, Chicago, Cincinnati and places of that sort: perhaps New York conditions would be different.

A. New York conditions are what I was referring to. Our rate from Galveston as compared——

Q. What was the character of the tonnage of the Ft. Smith? Did you confine it to some particular tonnage?

A. Merchandise from seaboard territory and hardware; different things of that kind.

Q. How is that affected by so-called river competition,
3045 even from New York? Explain that to me please

A. I mean that the state freight rates to Ft. Smith are made on river competition from New Orleans.

Q. If that is the case and if they were lower rates and control the situation, as explained, *where* in St. Louis and other territory to which the distributing merchandise is consigned would not the business of all that Western territory be swallowed up by New York, because, if New York and its facilities for ocean transportation can fix a rate into Ft. Smith, it can into Little Rock, can it not?

A. I guess it can, but I did not say it fixed the St. Louis rate from Little Rock, or the Cincinnati rate to Little Rock.

Q. You mean that the New York rate was circumscribed and fixed by that?

A. Exactly—whether other rates bore on that I do not know.

Q. Do you mean to say that the effect of that was so extensive and so broad as to enable Ft. Smith to swallow up the business—that Muskogee was——

A. I would not use that term "swallow up" Judge.

Q. It came to the door of Muskogee?

A. Yes, on certain commodities, and the railroads realizing the condition reduced some Muskogee rates, some Ft. Smith rates.

Q. On what commodities were those?

3046 A. I remember hardware and merchandise. Those are the only two things I remember. There were a number of things. At a conference between the railroads and Mr. Sangster those conditions were changed.

Q. I got the impression from your statement that you were describing general conditions, but it seems only special conditions in certain commodities, in which New York would be the basing point.

A. They are seaboard rates that were causing the trouble.

Q. Being the rate clerk of the Commission, you know more about it than I do. I will not ask you to give the rates, but I wish you would explain to me the manner in which the Little Rock rates are built.

A. The Little Rock rates?

Q. Yes?

A. I have never gone into the Little Rock rates to find out how they are built. I have had no occasion to go into them.

Q. In what litigation was it that you pointed out the disparity that you referred to in the Santa Fe rates?

You said that you discovered and pointed out where the Santa Fe rates charged on interstate business from Kansas City to all points on their lines in Oklahoma, or a large number of

3047 points, the rates were in excess of the combination of locals, etc.

A. The Commission proposed to reduce the class rates in Oklahoma—I believe that ruling was sometime in April—and I suggested or proposed on the hearing, a scheme of rates for application in the state of Oklahoma.

Mr. Koontz found I had reduced fifth class to what he thought was an unfair basis and insisted that my idea in that was to make a way to "skin" what was known as the through rate from St. Louis to Kansas City, especially Kansas City to Oklahoma points, and showed how much it would "skin" the rate by using the regular published rate from Kansas City to their station in Oklahoma, Chilloco, and from there south using the Commission rates.

I denied it but he insisted that that was my idea, so after I got off the stand I took his local rates as they exist today in the state of Oklahoma, and added them to the published rates from Kansas City to Chilloco, and found out I had in a number of cases made a lower rate than he was carrying.

Q. You stated that when you point that out you think it will be corrected?

A. I presume so.

Q. Why?

A. It would only require a suit before the Interstate Commerce

Commission to correct it. Under the Commission's decision
3048 the combination of locals should at all times be the through rate—the through rate should never exceed the combination of locals. They are both voluntary rates. They belong there in effect and are prima facie considered reasonable. The difference is slight—from one to three cents.

Q. You state it is impossible for there to be any relation between state and interstate rates and you base the statement upon the ground that the difference in distance is so great that a rate made on one basis would not apply on the other?

A. Further, the competition element entering into it.

Q. Explain to me now in what way the difference in distance would preclude the possibility of a relation?

A. I don't see where a relation can come between a rate for 400 and a rate for 50 miles.

Q. Let us assume that in the state of Arkansas, wholly, a commodity is shipped for twenty-five miles on a rate that will afford a reasonable compensation for the service involved in that length of haul:

There is another shipment of the same commodity going 300 miles, on a rate that will afford compensation for the service involved in the haul of that commodity:

There is a very material difference in the length of the
3049 haul, but may there not be a relation, notwithstanding that difference in the length of haul, as between the rates, in so far as the principle upon which those rates are predicated, is concerned?

A. No, sir. There is only one condition in which I see there would be a relation between state and interstate rates.

If it could be definitely ascertained that the cost of moving a commodity was a certain given figure per ton per mile—that there was a known cost of handling, then there could be a given rate per ton per mile, whether it moved 100, 200 or 1,000 miles. And added to that would be the terminal expense at each point of origin and each point of destination in the United States.

Then you would have a relation between state and interstate rates. But until that time comes—which I am glad to say never will come—there can never be a relation, in my opinion, between state and interstate rates, based on other than a competitive basis.

Q. That would be what you would call an ideal condition, would it not?

A. That would be an ideal condition.

Q. We do not expect to attain perfection in anything in this world——

A. I don't want to see it in existence, either.

Q. If the rate is based upon the cost of service—if the classification on which the rate is made, is made with reference to
3050 the different elements that enter into a rate—the factors in determining the cost of service, does that not create a relation between the two classes of rates built up on that principle?

A. No, sir; for the simple reason that state rates are invariably

built upon a mileage basis, while interstate rates are generally built upon a specific basis from and to a given point. The state rate does not take into consideration as to whether it moves from a large or small terminal. There is no question but what a shipment can be handled at Britan, Oklahoma, at a much cheaper figure than it can be handled at Oklahoma City, and if that shipment originated at Britan and is destined to Moore—a distance of approximately thirty miles, and a similar shipment originates at Oklahoma City and is destined to Guthrie, a similar distance, there can be no relation between the cost of handling those two shipments; none whatever. So how can you build an interstate rate that would compare, with those two shipments, which are absolutely dissimilar?

Q. On what ground and what principle did the Interstate Commerce Commission act in establishing a rule that a rate which exceeds a combination of locals would be prima facie unreasonable—is that not a recognition that a relation between state and interstate rates exists?

A. No, sir.

Q. What is the underlying principle upon which they
3051 act in that regulation?

A. Well, that is a different proposition entirely. If the rate from St. Louis to Wichita is 16 cents, and the rate from Wichita to Oklahoma City is 16 cents, there certainly is no reason existing why a rate from St. Louis to Oklahoma City should be 32 cents. It would certainly incur more expense in the handling—the loading and unloading of that shipment at Wichita, than to pass through Wichita. I don't know what was in the mind of the Commission, but I presume that was the basis upon which they established that principle. But they have gone further, Judge, and said they would not consider a state rate—a commission made rate, a legislative rate, as one of the factors in those conditions.

Q. That is immaterial to the matter we have in hand here now——

A. They say when a railroad voluntarily makes two rates, it cannot make a rate in excess of that for the haul over the entire district.

Q. Do you recognize the fact that the state rates, commission rates, do influence the interstate rates?

A. To some extent they might do it, yes, sir. In some peculiar interstate rates.

I can realize in your state very easily, that a state rate would influence a rate from Memphis. I can realize that in our state, a state rate would have some effect upon the Fort Smith rate.

3052 Q. It is in evidence in this case that a rate was established by the Arkansas State Commission, of 13 cts. a hundred on sugar, for a distance of three hundred miles—there is no traffic of that kind that the rate covers, in fact—but the gentlemen who are members of that Commission testified that that rate was made for the purpose of causing the decrease in the rate from Missouri, by some line of railroad going from Texarkana to New Orleans.

The trains in Texarkana wanted a lower rate for the purpose of

bringing the interstate down to that basis—that is, a state rate—and it accomplished that purpose, naturally.

A. That is a foregone conclusion. There is no doubt but what a state if it has a mind to, can in the exercise of its power absolutely abolish interstate rates or do what they please with them. I think there are very few commissions that have ever done it. We had one case in our state. The rate on cotton piece goods, mixed carloads of dry goods pass through Oklahoma—rate 42 cts. a hundred pounds—lower than they would stop it in Oklahoma. They carried it up on to Kansas City for 42 cts. per hundred—cheaper than they would stop it in Oklahoma. It was shutting our merchants out of business. They could not compete, less than carload, with dry goods, with the merchants in Kansas City.

Our Commission immediately should have proposed an order to establish a rate within the state on dry goods. It was said that
3053 the rate was to be used in making a rate from Ringold, Texas, from Tarroh, Oklahoma, to different towns in Oklahoma, regardless of what use it was intended for. It never went into effect because the Katy immediately reduced their rates from Galveston and the rate never went into effect.

Q. Does that signify any relation between those two classes of rates?

A. No, it would signify that the Commission within the state to protect their own people forced the railroads to do justice.

Q. Forced them to put in a new rate that forced them to change their interstate rates?

A. They did not put in any rate, but the idea of the Commission proposing a rate which if it was put in would have made the same rate to Oklahoma City——

Q. It is in evidence in this case that the Commission's rate established in Arkansas produced quite a revolution in northwestern Arkansas upon the rates of the Frisco road, and the rates were put in with that purpose in view—I will call your attention to his testimony.

Judge Wallace, Chairman of the Railroad Commission, was asked this question:

"Q. Now, your Commission had no jurisdiction to regulate rates into jobbing points from other states?

A. We could influence them, but not regulate them.

Q. In what way could you influence them?

A. We could influence them in this way—that would be hard to explain, but interstate rates are influenced more or less by local
3054 rates; for instance, rates consist of a combination of the locals; in interstate, the through rates cannot be higher than the combination of the locals; freight rates are lowered here and that cuts down the combination of the locals, and in that way it influences interstate rates, especially inbound rates."

Q. Then he says, to illustrate the statement he made there:

"Prior to the promulgation of the Commission's tariff, the Frisco Railroad had interstate rates effective at stations in Arkansas, north of Ft. Smith; that is on its line north of Ft. Smith, with which the

Fort Smith jobbers could not compete; it gave the Missouri points practically a monopoly of that trade, or at least it was so represented to the Commission. The effect was to give the trade to Missouri points, and stations on the line of the Frisco, north of Ft. Smith; as a consequence, the Commission's tariff had no effect—its local rate which was effective anywhere in Arkansas—had the effect to just reverse the order of things, and transfer that trade at all stations north of the line practically to Ft. Smith, and then, of course, the Frisco would have had to lower its rate from St. Louis and other interstate points in Missouri, north of the Arkansas line, in order to have enabled those interstate merchants—that is, interstate as to us, to compete with the Ft. Smith jobbers; now, the same condition of things was applicable in some instances, to a portion of the traffic of all through long line roads. The effect of it would be, of course, not necessarily as I understand it, reducing their revenues or income, but lowering the rates so as to give Arkansas competitors, as to all classes of traffic while between Ft. Smith and north of the Arkansas line——"

Is that in accord with your views as to the effect of state rates?

A. Yes, sir, and I think it is justified. We have a condition existing on the Kansas City Southern. They have a peculiar tariff
3055 of rates in effect to Ft. Smith,—that same tariff on a mileage basis is not in effect from stations in Oklahoma, with the result that no jobbing house can do business in Oklahoma, on the Kansas City Southern.

As soon as the class rates of the Corporation Commission of Oklahoma go into effect—which will be issued in probably ten or fifteen days—they will materially change that condition, and it won't be an unjust change, because the Kansas City Southern has—refused to permit stations in Oklahoma to job on its line.

There will be a condition where the state made rate will influence an interstate rate, and fairly so, and I presume the same condition exists on the Frisco,—they are giving a low rate, what they call their "jobber's special," as well, and making Arkansas pay the penalty.

Q. I am not assuming that the action of the State Commission was improper or unfair. The significance of this power of a State Commission to influence interstate rates, is this, is it not, that it shows there must be a relation: otherwise how can a State Commission by its regulation as to rates influence the interstate rates?

A. There is a competitive relation, a commercial relation, which I admitted from the first, Judge Moore.

Q. How does that bring about that result of putting the two classes of rates on some little parity.

A. It comes about due to the fact that the railroads in
3056 order to—that the railroads must again cut *its* rate to meet those made by the state and when they do that they show very plainly that they are not making the rates on the cost of service. and they have *in* a different scale of rates, which they did in Arkansas, presumably, from their testimony, allowing the Missouri merchants to get that business, their rates from Missouri and Ft.

Smith were not both built on cost of service, or else Missouri merchants would not have the advantage.

Q. You are speaking about voluntary rates?

A. Yes, sir.

Q. That brings up two conditions: one is the Interstate Commerce Commission holds as to voluntary rates, that an interstate rate which exceeds a combination of locals is prima facie unreasonable?

A. Yes, sir.

Q. That is voluntary?

A. Yes, sir.

Q. The record in this case shows that the instances about which we have been talking and the commercial conditions you speak of—but let that be what it may—are such that a commission rate will have the same effect upon the policy of the railroad independent of the ruling of the Interstate Commerce Commission, and they work out the same result?

A. There is no cost of service in that whatever——

Q. You are talking about the relation?

3057 A. I said that there was no relation from the cost of service standpoint. I have admitted that there was from a commercial standpoint and I still insist that there is.

3058 Cross-examination of Mr. BEE resumed.

By Mr. MOORE:

Q. Mr. Bee, you were speaking in your examination in chief in regard to freights transported from St. Louis to Oklahoma points:

You say this freight comes in competition with Atlantic Sea Board freight handled via Galveston, and in competition with German and English made goods handled via steamers; that there is a very low rate, practically brought over as ballast, and so on:

What class of commodities did you have in mind in your reference to competition with German and English made goods brought over in those steamers?

A. Dry-goods and boots and shoes—not German made boots and shoes—dry goods, silk goods and general ladies dry goods department notions; crockery, hardware and stuff of that kind.

Q. Do you mean to say that that sort of goods is brought over practically as ballast?

A. I say it is brought on low rates at times, which would be virtually ballast. Boats coming over for cotton, they will take any commodity then can get at most any rate.

3059 I saw a figure the other day where a boat had brought crockery from Liverpool to Galveston; unloaded it, reloaded it and shipped it to San Antonio cheaper at the through rate than crockery could be moved from east Liverpool, Ohio—I think that is the crockery point—to Kansas City..

Q. Is there any large movement of commodities of that kind from European ports to Texas?

A. I understand there are large movements of hardware and heavy shelf goods from European ports to Galveston.

Q. There certainly is not much general merchandise?

A. Some general merchandise comes through there, the kind I do not know.

Q. Do you mean to say that that is of sufficient volume to influence the railroad rate from St. Louis into Oklahoma?

A. I think to a certain extent. They meet the Galveston rates. The rates are practically the same from St. Louis to Galveston, but I think the Atlantic Seaboard is the principal factor. I don't think the European itself is much of a factor. Merely the last drop in the bucket. I merely mention all the factors as I saw them; not any specific factors.

Q. You attempted to compare a movement of lumber from mills in Southern Arkansas, from the forest to the mills, and from the mills to Little Rock, with shipments to interstate points:

Your attention has been called to the reciprocal tonnage that the railroad companies involved in this litigation get in con-
3060 nection with that business:

Is there any tonnage going south from Little Rock that would balance the lumber hauled to that place, from that section of the state?

A. I imagine there is grain, cotton and some commodities moving from Little Rock south.

Q. Have you any information upon that subject?

A. No, I have no information on the subject that they have any reciprocal tonnage from interstate, either.

Q. I believe you say that ten cents a mile is the ordinary charge for moving new empty cars?

A. No, that was the Missouri Pacific charge.

Q. The Missouri Pacific?

A. Yes, sir. I do think it is the ordinary charge but I did not say it was. I said the Missouri Pacific charge.

Q. So that the distance is not a distinction of the reciprocal tonnage, would be a matter of considerable importance in determining the relative expense of moving freights of the character we are speak ing of?

A. In moving any freight it would be a factor, Judge.

Q. I believe I called your attention once before to the conditions under which lumber is shipped from the points you refer to to Little Rock. That is to say, the rates to which your attention was called by Judge Hill, 22 cents to Little Rock, I believe it was, apply only to lumber that is shipped to that section from lines other than
3061 those that reach Little Rock?

Now, in view of that fact, do you know whether it is or is not a fact that there is no lumber moving into Little Rock on that 22c. rate—that is practically?

A. I don't know whether any moves in there or not, Judge. I am not familiar with the specific conditions over there and can only testify generally.

Q. The rate on lumber from points in northern Louisiana on the Iron Mountain to Little Rock, is 14 cents on yellow pine and on the

Cotton Belt it is 16 cents, and that rate of 22 cents which Judge Hill called your attention to, applies only from points in Louisiana on lines other than those reaching Little Rock:

It would hardly be reasonable to assume that a Little Rock man who wanted lumber, would seek the higher rate, would it?

A. Yes, I should imagine that man would seek the higher rate or else the rate would probably not be in. There must have been some movement to cause the rate to go into effect. The man at the mill may be able to manufacture his lumber at the 22c. point cheaper than the man at the 14c. point——

Q. Do you think that the dealer at Little Rock would prefer to pay the 22c. rate rather than the 14 or 16 cent rate?

3062 A. Not the dealer at Little Rock, but I think the mill man would probably absorb it and thereby puts the lumber to the dealer——

Q. I am speaking about the man at Little Rock, who has occasion to purchase lumber from that section.

A. If you will allow me to explain that. We have just been through a severe lumber case. We had lumber men from everywhere testifying before our Commission and they invariably testified that lumber was sold f. o. b. cars at the lumber yards. So the difference in freight is not a matter that the dealer in Little Rock would take into consideration, if the conditions that the Louisiana and Texas mills testified to are correct:

Q. It would be rather a novel exhibition, would it not, to see a man, whether he is a lumber man or whether he is a purchaser, without regard to whether there was any excess that might be absorbed by somebody, as in the case you are putting—leave the relations and the dealings between the lumber purchaser and the lumber buyer out of the case: the question I ask you is, if it would not be a peculiar condition to find that the man would pay a 22c. rate when he could get a 16 and 14c. rate?

A. No, I see that in Oklahoma every day, where they are paying 23, 24 and 25½ cents—I think that is the maximum rate—when they can get an egiht, ten, 12, and fourteen cent rate, as the maximum. Those are commercial conditions, Judge, which equalize themselves.

3063 Q. So there are commercial conditions applicable to other conditions than railroads, then?

A. There are, where railroad freight is concerned.

Q. Can you recall and tell me what the rate on first class commodities is, in your state?

A. From where?

Q. Different points in your state?

A. I will read it if you will permit me to do so and not trust to my memory.

| | |
|---|---|
| 5 miles | 13 cents. |
| 10 miles | 15 cents. |
| 15 miles | 17 cents. |

20 miles.....19 cents.
25 miles.....20 cents.
30 miles.....22 cents.
35 miles.....24 cents.
40 miles.....25 cents.
45 miles.....26 cents.
50 miles.....27 cents.
55 miles.....29 cents.
60 miles.....30 cents.
65 miles.....31 cents.

Q. What does that yield per ton per mile?
A. At what point?
Q. Say 50 miles?
A. I want to say that these are the jobbers' rates, I am quoting, which move about 93% of our business.

Mr. HILL:

Q. Are they the voluntary rates of the railroad?
A. Yes, sir.
A little over a cent per ton per mile, for 50 miles.

Mr. MOORE:

Q. I ask you that in connection with a statement you made yesterday, regarding the rates from St. Louis to Mulhall: you
3064 stated that the distance to Mulhall was 590 miles?
A. Approximately.
Q. And the distance to Oklahoma City was 640 miles; I want to ask you if the distance to Mulhall via Kansas City and thence on the Santa Fe route beyond Kansas City, is not 625 miles?
A. I would not be surprised.
Q. That makes quite a difference, does it not?
A. Yes, sir.
Q. Instead of a difference of 50 miles it makes a difference of 15 miles?
A. But the distance via Omaha, Nebraska, is much greater.
Q. Does that not make a difference in the application of the rates?
A. What is that?
Q. The difference of 15 miles in that distance of 640 miles?
A. It would not make much difference. If you figure right on to Oklahoma City—you should figure right onto Oklahoma City via Mulhall if you are going to figure via Kansas City. I was taking what I presumed was the shortest mileage between the two points and was trying to give you the advantage of the short line.
Q. Is not the Kansas City line the natural line for shipment from St. Louis to that district to take——
A. No, sir, I think the Katy is the short line to Oklahoma
3065 City by probably 50 miles.
Q. That is to Oklahoma City?
A. Yes, sir.

Q. How is it to Mulhall?

A. I think the route to Guthrie and back haul would be shorter than via Kansas City.

Q. What would that be?

A. I think about 590 miles, it is my recollection. I may be slightly off in those distances. I never figured them before I came here.

Q. What is the revenue per ton per mile on each one of those routings?

A. If you call those figures again, I will gladly give it to you.

Q. The distance you assumed was 640 miles to Oklahoma City and 625 miles to Mulhall.

A. There would not be enough difference between those two rates to find it.

Q. Well, say 590 and 640, put it on your figures.

A. One approximately 40, and the other 44 mills.

Q. You were mistaken then when you said the haul from St. Louis to Oklahoma would be 20 mills, and from St. Louis to Mulhall would be 22?

A. Yes, I see where I made my mistake. I forgot to reduce it to tons. I divided the rate on a hundred pound basis instead of taking it to tons.

Q. Since you have corrected that, do you not find that
3066 one rate is less than six mills and the other is 40.6?

A. One will be 40 mills, plus and the other 44 mills, plus.

Q. Now, take it on the Santa Fe road, assuming one is 625 miles and the other 640 miles.

A. If you take straight Santa Fe the one 625 and the other 640. Oklahoma City on the Santa Fe is about 40 odd miles—between forty and fifty miles—south of Mulhall.

Q. I said assume that the route to Mulhall routed via Kansas City on the Santa Fe—I understand that makes a routing of 625 miles. Figure it on the basis of 625 and then on the basis of 640.

A. The one would be 40 mills, plus, and the other 41 mills, plus. Is that close enough?

Q. Those differences are not very striking, are they?

A. No, they are not striking differences.

Q. The reason I called your attention to this is that you brought that in voluntarily as an illustration of the proposition in which you said positively and absolutely that there is no relation between state and interstate rates:

What light does that throw on that question?

A. I figured four mills difference which there is between the Santa Fe handling both of those shipments and if there is four mills difference, there is certainly a difference in the cost of service, and both of those figures cannot represent the cost of service. If there is only one-tenth of a mill difference both figures cannot represent the cost of service. And that is certainly true when
3067 railroads handle lumber at six mills per ton per mile and the difference in handling this merchandise from St. Louis

is four mills per ton per mile. There certainly is an element of cost in there that is not taken into consideration.

Q. In order to get that difference you have to select a particular routing?

A. The Santa Fe would have to——

Q. If you route it in the way I indicate it, it is about one mill difference.

A. But the Santa Fe could not handle it that way.

Q. Assuming that it could handle it that way?

A. It is a physical impossibility for the Santa Fe to handle it at a distance of 640 if the mileage to Mulhall is 625. If you are going to figure the Santa Fe you must figure that straight through.

Q. What I asked you to do was to figure it on the basis of a routing via Kansas City and beyond there——

A. For the Mulhall——

Q. On that route that you speak of as 640 miles?

A. I was figuring them both being approximately short routes, what I consider short routes.

Q. In your examination in chief you undertook to show the relative rates per ton per mile, the relative amount of revenue per ton as between state and interstate less than carload business:

3068 I believed you worked out that the railroad company secured on interstate business $1.90 per ton and that from state business they received $4.84:

Please tell me how you worked out those results?

A. I explained at the time, Judge, that if the rate shown in this exhibit No. 26—which I understand is a railroad exhibit— shows that the average rate per ton per mile on interstate business destined to Arkansas, is 33. mills per ton per mile; the average rate on state business in Arkansas for the same period was 67. mills per ton per mile. The average haul on state business was 57. miles and I multiplied the rate per ton per mile on interstate business by that 57.18 and the rate on state business per ton per mile by 57.18 and it gave me the figure that was received by the road on each class of business per ton; subtracting one from the other it gives a difference of $2.94.

Q. The rate per ton per mile on interstate business is 33.?

A. Yes, sir.

Q. In order to get the amount realized the revenue yield per ton on that business, you multiplied that by the average haul of state business?

A. Yes, sir.

Q. Do you not know that you cannot get that result in that way?

3069 Do you not know that if you want to get the yield on interstate business that it is necessary in order to do it to multiply the rate received per ton per mile by the average haul of interstate business and not state business?

A. If you want to get the total revenue.

Q. We are talking about the revenue per ton.

A. No, sir, you don't have to do that.

Q. On what ground are you justified in multiplying that rate

received per ton per mile on interstate business by the length of the state haul? That is absolutely impracticable.

A. No, sir, it is not absolutely impracticable.

Take a point on the Missouri Pacific starting at the state line—I believe the average interstate haul was 100 miles, I am not sure of that figure, we will take that line from the state line to a point 109 miles in Arkansas, calling that station X, regardless of its name, that being the average haul on interstate business within the state.

Now, we take a point 57.18 miles between that point X and the state line and we call that station Y, calling the state line W:

The haul from W to X represents the average interstate haul on less than carload business on 109 miles.

The haul from Y to X represents the average state haul, or 57.18 miles:

My proposition was to see the amount of revenue secured by the Iron Mountain Railroad on interstate business moving the exact same distance that state business did.

3070 In other words, between X and Y, and the only way to do that is to multiply the average revenue received by it by the haul that was performed on state business, multiplying 33. by 57.18. That gave us the figure of $1.90 per ton. And upon the same business, state, moving between identically the same points, it received a revenue of $4.84.

It is feasible at straight mathematics.

Q. Does not that exhibit itself show the revenue on state business per ton and also on the interstate business?

A. Yes, sir.

Q. Is it all figured out there?

A. Yes, sir.

Q. What is it on interstate business?

A. The total revenue?

Q. Revenue per ton.

A. 33.

Q. That is per mile. Look at the exhibit and tell me what it is?

A. Oh, yes, $3.63.

Q. What is it on state business?

A. $3.84. But you must take into consideration in considering these figures that one moved double the distance——

Q. If they moved the same distance the rate and yield would have been the same?

A. I don't know.

3071 Q. Would it not, mathematically?

A. No, sir.

Q. Is it not the difference growing out of the fact and does not that make the ratio of about two to one growing out of the fact that it costs practically the same to move the interstate, 109, as the state, 57.18 miles?

A. No, it costs considerably more, in my opinion, from what I know of handling the freight.

Q. What did you say was the yield per ton on the state?

A. $3.84.

Q. You have it here $4.84: in your testimony you say that from state business moving the same distance the railroad receives 67. mills or $4.84 per ton.

A. I never took that factor at all. I never took those figures at all excepting the total, and I worked that out hurriedly on the morning before I came on the stand. Those figures (indicating exhibit) have been worked out on an adding machine and I prefer to take them, anyway.

Q. What is that?

A. Those figures have been worked on an adding machine and mine have not. I prefer to take them. I have the same figures, exactly, $3.84, and 67. My figures must be an error to the extent of carrying one figure.

Q. In speaking of the revenue of the Cotton Belt road you were asked by counsel what would be the fairness of dividing expenses between state and interstate traffic on the basis of the reve-
3072 nue received from each class and in answer to that question you denied that it could be done and then you gave the reason.

A. Yes.

Q. You say that because in the example that you worked out (referring to the example to which I have just now called your attention) the railroads get $2.94 a ton more revenue——

A. That should be $1.94.

Q. —from state than from interstate, and while their entire revenue from interstate terminating in Arkansas is $1.90 they receive an additional $1.04 for the extra terminal than they get for the entire handling of the other shipments:

Now, that was a mistake, was it not?

A. To the extent of one dollar.

Q. Mr. Bee, all the statistics in this case from the beginning to this time have shown that the average returns or revenue on state business per ton per mile is about double that on interstate.

A. So I understand.

Q. A little less than double. The statistics from the beginning show a relation of about 6½ to 13, somewhere about that, with an average haul of one-third the length of the interstate haul:

Does not this example you brought out come back to that
3073 old proposition that has been conceded by all parties in this case?

A. The facts have been conceded. That brings it back that the revenue is two to one for a haul of three to one.

Q. This average amount of revenue received per ton per mile on the interstate freight of 33 and a fraction simply shows how much it costs to haul those one hundred and nine miles—that is, how much is received—the yield on the haul of a ton of that class of freight 109 miles as against a yield on the haul of the same kind of freight 57.18 miles, does it not?

A. That does show that, yes. It shows that the railroad companies receive more than double for less than one-half the haul.

Q. Is it not also based upon the proposition that the average interstate haul is really greater than 109 miles?

A. You mean the double haul?

Q. Of the interstate haul? While the average has 109 miles, in most cases the interstate exceeds 109——

A. I think that interstate hauls as a whole exceed 109 miles.

Q. I mean the interstate haul in the statistics that have been used in this case, that represent that part of the interstate haul located in the state of Arkansas?

A. That is true.

3074 Q. And it results necessarily that in many instances it involves a much larger haul than that shown in the state of Arkansas?

A. It indicates a longer haul.

Q. Does it not follow that this cardinal rule of cost of transporting freight, that as the distance increases the rate diminishes? Does not that come into play and produce that result?

A. Only to a certain extent.

Q. That is one of the factors——

A. But the state of Arkansas cannot take into consideration the fact of what it costs to haul in some other state or how far it moved in some other state. It is entitled to revenue from interstate business moving within the state.

Q. Applied to the 109 in the state of Arkansas as against 57.18 miles and you have there practically three hauls to one——

A. No, two to—a little less than two—114 as to 109, dropping fractions.

Q. It is analogous and pretty close to the difference in the revenue per ton per mile, 33 and 67?

A. That is true.

Q. And does it not grow out of that rule which applies to all transportation problems, that is, as you increase the length of haul you diminish the rate?

A. It grows out of that and I think it can be abused. I think it has been abused with these figures if you compare the two.

3075 Q. You lost sight of that, did you not, when you worked out that? As an example as bad conduct on the part of the railroad?

A. No, sir, not as an example of bad conduct on the part of the railroad. I worked that out to show that the state rates as they are built and as they are charged and as they show in this exhibit, pay whatever extra cost there is of doing state business and they pay double the rate for moving over each mile than an interstate shipment does. The only idea that we ever have in saying, the longer the haul the cheaper it becomes to haul it, is because the terminal expenses must be taken of- at both ends of the line. If the haul is ten miles then that ten miles rate must take care of those terminal expenses. If the haul is 1,000 miles, then the one thousand mile rate will take care of those terminal expenses.

It means a smaller unit to apply on that terminal expense, but it does not mean two to one on a haul of this kind, in my opinion.

Q. We will come to that in a moment, but I want to ask you now, are there not other factors and factors of importance than the mere length of the haul itself affecting the rates that should be charged, and the cost of the service, and what it means to the railroad to handle freight a long distance and a short distance.

A. Not after it moves over one division, passes one di-
3076 vision.

Q. You repeat now what you stated in your examination in chief, that it is only one additional terminal expense that creates the difference?

A. No, I say there is no difference in the cost of the haul after it passes over one division.

Q. What do you mean by that?

A. If a shipment originates at a small point, the cost of haul is probably more expensive to the next terminal than it is anywhere else.

Q. Please explain that.

A. It is handled on the local train and would probably be handled up to that terminal point. Then the cost of service will be just the same from that terminal to the next terminal and as to each succeeding terminal, if the road condition grades and everything of that kind are the same.

Rates are not made upon a difference of one terminal as against another terminal——

Q. Now, let us see: there has been some testimony in this case about over-head expenses, general expenses: would that have any influence upon that proposition?

A. Not any whatever. The over-head expenses apply just the same on one division as another division.

Q. Take two hauls, one of 50 and the other of 150 miles in length:

In considering the expense involved in those two
3077 hauls you say that after you pass one division the expense is the same, and in your examination in chief you said there was a difference of more than one terminal expense.

A. The additional haul takes care of that and I explained that just now.

Q. I know, but I want to call your attention, first, to the effect of these fixed expenses:

If there is a fixed charge in any business, railroad or any other, that must be met, that is applied to all the business, is it not, in proportion that the business will yield a revenue?

A. That is true.

Q. Well, if you apply that in this case would there not have to be a——

A. I see what you are getting out: if there are 100 cars moving over a division you would apportion a less figure than if 50 moved over the division. There is something to that——

Q. Then, Mr. Bee——

A. —but it would cost just as much to haul over the next division

and the next division, because those over-head expenses would again go down on the card.

Q. I believe it was stated by you or some other witnesses, that the length of a division is usually 100 miles.

A. The present divisions are around 100 miles, I understand.

3078 Q. Take what we have here: we have a state haul of 57.18 miles in average length and an interstate haul average length of 109 miles: what effect would that have upon your application?

A. The length of haul would exact the decrease expense.

Q. You have two division points there, to go from one division to another in the interstate haul, while you are within one division in the state haul——

A. If you pick your haul right.

Q. You have to average it?

A. I don't think you can average it; if they stay in one division.

Q. The statistics in this case show that the average haul of interstate freights is 224 miles and the state freights 70 miles in the state of Arkansas:

The evidence of Mr. McPherson, the Assistant General Manager of the Iron Mountain, and Mr. Ward, General Manager of the Burlington, show that in handling a given tonnage of state freight a distance equal to the average haul of state, in Arkansas, that the service involved would be at least eight times as much as it would in moving the interstate freight.

I will ask you if the statements of those witnesses are correct. I suppose you have read the testimony in the case and know what it is?

3079 A. I have not read the testimony in the case on these particular points, but I have seen similar statements from other general freight agents.

As to whether they are correct from their view or not, I don't know, but it certainly is not my opinion. I don't wish to say their statements are not correct, because from their view they probably are, but I fail to find any man who can substantiate the fact that it costs eight times — to do state business than it does to do interstate business. I fail to have the elements pointed out to me that shows that it costs eight times as much.

Q. Assuming for the purpose of my question that their statements are correct:

In that event, ought there not to be a very much larger yield derived from the transportation of state freghts than from interstate?

A. I should say an exceedingly much larger revenue from state than interstate if their statements are correct.

Q. In that connection, I want to ask you if you considered that the experience that you have had in connection with the operation of railroads, is such as to qualify you equally with these operating men who are perhaps twice as old as you are, some of them, and who have devoted nearly all their lives to the study of the problems involved in regard to the matter about which they are testifying?

A. I don't want to have to answer that question because
3080 I hate to put my answer in the record.

Mr. HILL: I do not think it is a fair question.

The MASTER: That question is simply asking the witness to put an estimate on the skill and ability of other witnesses who have testified in the case and I do not think it is an admissible question.

Mr. MOORE: I am asking him if he considers himself as well qualified as others who have shown what their qualifications are. I think I have a right to do that.

Mr. HILL: I do not think so. The witness has shown at great length his qualifications and they must speak for themselves. The other witnesses have shown their qualifications and they must speak for themselves.

Mr. MOORE:

Q. Have you had any experience in operating a railroad, as an operating official of the road?

A. Not as an official of the railroad, no, sir, other than the experience I gained directly under officials who had charge of that part of the work.

Q. And that experience that you have related in answer to questions asked you by me?

A. I have, with the exception of the experience I have gained since I have been with the Commission in Oklahoma, where I have had the same advantages, if not more, than an operating official, to go deeper into their affairs than probably some of them can go into them.

Q. Mr. Bee, do you know where the interstate less than carload freight that is moved in Arkansas over these two lines we
3081 are discussing now, principally originate?

A. I have an idea; I don't know.

Q. Memphis and St. Louis, is it not?

A. Yes, sir, and Kansas City, I should judge.

Q. Is it not principaly outside of grain, Memphis and St. Louis?

A. From my knowledge of these Kansas City merchants, I imagine they go over there and get a lot of business. That would be my idea and knowing these Kansas City merchants as I do and having a direct line into Arkansas.

Q. You just stated a while ago that the average length of haul, if you take the haul of that class of less than carload interstate, out of the state it would be longer than shown on these statistics, 109 miles?

A. There is no doubt about that.

Q. In addition to that there is one terminal expense, is there not, connected with interstate business as against the state?

A. Yes, sir, and that is the only additional expense I think of state business.

Q. Narrowing it down to that point, does not that difference justify a greater revenue from the state business than from the interstate?

A. Doubtless.

Q. Right along that line, I want to call your attention to another statement you made in the same connection as the
3082 testimony to which I have called your attention already. You said it must be remembered and taken into consideration that every time a pound of state less than carload business is delivered there are two pounds of interstate less than carload business handled: what follows is what I want to call your attention to. Along with what and on the same conditions——

A. I think so.

Q. If the conditions to which I have called your attention as to the interstate business, it is originating in another state and it is having a longer haul, are true, can it be said of the class of that business that it is handled along with and under the same conditions as state business?

3083 A. This is what I mean by that,—I cannot answer you yes or no, I have to make an explanation of my answer; I mean you take the business originating Little Rock in the state, just as an example, and being handled in the local train to points between Little Rock and the next terminal either way, I mean that in my opinion for every pound of Little Rock business that is delivered, there will be two pounds of interstate freight, destined to that same destination; that has been my experience in the southwestern country, that Memphis, St. Louis and Kansas City in your state, would so handle that traffic that they would deliver more than the Little Rock jobber, as to these little towns, and there is an expense that is incurred on interstate business where they would have virtually three terminals instead of one; it would have a terminal when it come into Little Rock to be taken out of the car, a terminal to be put back in the car, and a terminal when it was unloaded again; Now, the proportion of that business in Arkansas, of course I cannot speak definitely.

Q. Are you referring to statements which you have heretofore made, that a shipment of L. C. L. freight from St. Louis to a point north of Little Rock, say thirty or forty miles, will be carried to Little Rock on the Iron Mountain Railroad, and there unloaded into a local car and hauled back to the point of destination?

A. It might not be hauled back; it might be hauled forwards; it might be hauled back; I believe they do haul some freight back.

3084 Q. Is that the practice in Arkansas?

A. I don't know whether it is the practice in Arkansas, but it is the practice in other places, and I know some of the roads in Arkansas do follow that practice. I know the Frisco does follow that practice in Arkansas or in Kansas or Texas or Oklahoma.

Q. You made this statement in that connection, you say:

"I have checked these things time and time again—not in the state of Arkansas, of course, but in other states; in Oklahoma, Missouri and some in Kansas, but most of my investigations have been in Oklahoma, and I have found that trains proceeding northward from the heart of Oklahoma carry more freight in their local

peddling trains, which originated at points north of Oklahoma, than they do of freight that originated in Oklahoma. It has simply been brought there in a solid car, split up and then going back for distribution, making a back-haul and receiving exactly the same service that the state less-than-carload is receiving, with the exception of making out the way-bill at the original Oklahoma point, but to counteract that they have unloaded that freight and checked it at that station."

That is the condition you refer to when you speak of the state and interstate being carried along under the same conditions?

A. Yes, sir.

Q. Does that condition exist in Arkansas?

A. I can't say positively that it does.

Q. Yet you assume it does?

A. Naturally a man has a right to assume experience and knows the condition of other roads, and the general practices of
3085 railroads in Oklahoma, Kansas and Texas, he has a right to assume in his opinions that the same practices follow.

Q. I don't question the propriety of it.

A. I said I had never checked in Arkansas; I don't say that the same condition prevails.

Q. Have you sought any information about that? Have you had any conversation with persons who know and who have looked into that?

A. I have, and I have understood—I don't know about the back freight, I don't remember the statement on that, but that freight going into Little Rock and breaking bulk and being distributed in the opposite direction which would be the same service, and that is a practice and that freight has been found in cars of that kind.

Q. It simply operates to bring that class of freight to the division point in the direction it is going, in handling it from there from the car that brought it there, isn't that a very different proposition from the other?

A. Yes, sir, the Frisco has issued orders—I am very familiar with their rules because I have worked with Mr. Levy, whom I knew as a boy, worked with him on the formation of his rules; their rule is to bulk everything to the first big town and from there distribute, and I think it is the best policy, and cheapest method that can be adopted.

Q. There is another fact involved in your assumption
3086 that for every pound of state freight that is carried, that every pound of state freight is accompanied by two pounds of interstate freight; that means that the people of Arkansas in their package purchases, buy double as much outside of the state as in it?

A. Not necessarily; it means that Little Rock merchants located a few miles from said Little Rock, Fort Smith and Pine Bluff and Memphis, are buying their stuff just as much outside of the state as they are in.

Q. Doesn't mean buying twice as much?

A. Yes, sir, and I think you will find that is true; that is the effect I have generally found, and I have simply used that; your

facts in this case will bear out this statement on that, I think; if I am incorrect, it is only my opinion taken from my own state.

Q. If you have had anything at all to do with the conditions in Arkansas, don't you know that the larger part of the interstate L. C. L. freight is shipped to a few jobbing points from which it is shipped to final destination?

A. I wouldn't think the L. C. L. was, because as a rule, jobbing points can afford to buy in carloads.

Q. My attention is called by the auditor in the Cotton Belt road, to the division in the haul shown by the statistics in this case on that line; it is 307 miles trans-state less than carloads, 132 interstate, and the state is 36, less than 1/8th of the trans-state, and about ¼th of the interstate. Under your view as to the effect
3087 of passing terminal divisions upon the expense of handling these two classes of L. C. L. freights, wouldn't there be quite a large scope for a difference in the revenue that should be derived—I mean for the service rendered and revenue derived.

A. There might be a difference.

Q. Wouldn't that indicate quite a difference?

A. It would be 132 against 36.

Q. And it would be 36 against 307, which is 64% of the ton mileage on all business.

A. That is trans-state business?

Q. Yes.

A. Trans-state business should carry a much less rate because each mile is bearing its unit of the terminal cost.

Q. You described in your testimony in chief the manner in which cotton is picked up; you say it is picked up and carried to division points and local trains set the empties for grain also, speaking of that; you have no knowledge of how that sort of thing is handled in Arkansas, and on these lines involved in this controversy?

A. No, sir, it is general experience.

Q. Do you know how much cotton is handled by the Iron Mountain Railroad and Cotton Belt Railroad, respectively, from October to January of each year?

A. I haven't the least idea.

Q. You know it is a very large tonnage, don't you; you
3088 have stated that you had a general knowledge of the conditions?

A. I know they handle considerable cotton. I understand there was 50,000 bales of cotton compressed at Fort Smith, and I presume the Missouri Pacific gets their fair share of that cotton.

Q. Would one local train a day be able to handle the volume of that traffic moving in the way you described?

A. Yes, sir.

Q. One local train a day would do it?

A. I think the outbound local setting the empties, and inbound picking the loads up and bringing them in, I think she could possibly handle it; you might have to put on an extra train for that service; I don't know the volume of business over there; I

have known times where pick-ups had to go out and relieve division points time and again.

Q. What are "pick-ups"?

A. Trains that run out from terminals and pick up loads and carry to the next terminal.

Q. Is that kind of train used a good deal for handling that kind of freight?

A. They are not run every day, no, sir; sometimes a month goes by without a pick-up train, and sometimes they run a pick-up every other day.

Q. What is that condition that causes that?

A. The heavy movement of grain or any other commodity; solid trains come out and pick up live stock and come in with
3089 them; I have known as high as six pick-ups to go out and pick up cotton.

Q. Because there was more than the regular schedule train could handle on that particular day?

A. Yes, sir; perhaps on that particular day the market was going up, and they will dump in a load of cotton at that time, or for different reasons.

Q. You have said you didn't know the local conditions in the state?

A. No, sir.

Q. How many bales of cotton can a local freight train haul, as they are equipped in Arkansas?

A. Give me the rating of your engine and the division, and I can probably answer your question.

Q. You haven't the information yourself?

A. No, sir.

Q. I am told that 800 gross tons would be an average rating of engines?

A. In how many cars? I can tell the rating given in engine rating books.

Q. Is the rate of power of the engine dependent upon the number of cars it has to move?

A. At times it is; an engine might handle eight hundred tons weight of loaded cars, and could not handle eight hundred tons of empty cars; the draw bar pull would be excessive.

Q. You are acquainted with the kind of cars that cotton
3090 is usually hauled in?

A. It is handled in any kind of car, just so it is a good car; it might be a furniture car, or a common box car.

Q. Your general information is such that you would have some knowledge, I suppose, of the character of cars usually used in that traffic?

A. Yes, sir.

Q. Just assume such cars as you have been accustomed to?

A. I would say that a train could handle at least forty cars, and probably more; figuring 20 bales to the car, that would make 800 bales; it could probably handle more than that, picking up and everything; an engine of that rating, the cars weighing 16½ tons,

figuring 20 bales of cotton to the car, could probably drag in sixty cars; I don't know how many cars they run in Arkansas on their track; I would like to know that before I answer that question; and that would make it vary between 800 and 1200 bales; sixty cars would be a very heavy train I imagine.

Q. What would a train of sixty cars weigh, as you described?

A. It would weigh over that; my first figure was nearer right; I figured the car and its contents weighing 35 tons, the first time, and forty cars would be 1400 tons.

Q. Is that over the capacity of 800?

A. No, sir; those must be light engines; our engines come
3091 in on our divisions with thirty and forty and fifty cars.

Q. I am asking of the capacity of an 800-ton engine; I mean the weight of the cars and contents?

A. I understand that; exclusive of the caboose, that would figure a fraction over 23 cars, and 20 bales to the car would be 460 bales; I imagine that would be a very light train.

Q. Those trains are rated lighter because they have to make a good many stops, aren't they?

A. On account of her pick-ups and stops, yes, sir. I understand that a local train between stations makes better time than a fast train.

Q. You say trans-state trains are seldom run; you are not undertaking to speak for the practice on the roads that are parties to this litigation?

A. No, sir, speaking from my experience and the evidence that I have understood has gone in in this case, that is the only evidence I have got for the Missouri Pacific.

Q. If the capacity of a local train is 460 bales, as you figured out in your last answer, how many bales would it move in the course of a month, 26 working days?

A. 11,960.

Q. That would be about 33 or 34 or 35 thousand bales for the season that I called your attention to awhile ago?

A. The season extends for practically three months and a half, 41,860 bales.

3092 Q. Do you know how many bales were received in Ft. Smith annually?

A. I understood 50,000.

Q. Do you know how many in Little Rock?

A. I haven't the least idea.

Q. You have already testified you had no knowledge of Little Rock terminals; you don't know how they handle Red Ball trains and Green Ball trains?

A. Nothing except the rules.

Q. You have no knowledge of the arrangement of the tracks there, the sidings?

A. None whatever.

Q. You have already testified that you only spent a day or a day and a half there, and you didn't go to the yards?

A. No, sir.

Q. You had no opportunity of seeing what conditions at the yards were?

A. I did not.

Q. I want to call your attention to some statements which you made in that connection, when you made the statement that a Red Ball train could go into Little Rock with fifty or sixty tons of its tonnage for Texas, and the rest was divided up to go somewhere else, with the result that other cars would be put into that train. What do you base such a statement as that on, with regard to that class of traffic, without knowledge of the conditions at Little Rock?

A. From these rules right here.

3093 Q. You say even if the trans-state trains were run right through, it would have to stand upon the main line for twenty or thirty minutes at each division?

A. It would require the main line to be left open at least ten or twenty or thirty minutes before its arrival.

Q. Of course, whenever a train has to be let past, it is necessary for a passage to be left open; you know nothing about the length of time required; it is a mere estimate of yours?

A. No, sir, I know that no train can get through a terminal where she has got to get her boxes examined, under twenty or thirty minutes, with the switching of her engine and caboose.

Q. The point I want to call your attention to, the manner in which that inspection is made depends upon the arrangement of the classification terminals through which these trains are carried, doesn't it?

A. To a certain extent it does.

Q. And you could not determine, or could not undertake to say with any degree of accuracy, could you, as to what the practice would be at a given place and given terminal, without knowing something about the arrangement of the yards?

A. I wouldn't know that positively, but I would to a more or less extent; I have taken this here (book governing movement of red ball and green ball trains) and found that at some of the

3094 terminals, I find a train going into De Soto is delayed thirty minutes; a train going into Piedmont is delayed thirty minutes; a train coming into Knobel is delayed thirty minutes; into Wynne, it is delayed there thirty minutes, and it is natural to presume those are conditions that exist elsewhere.

Q. You are reading that from the book of instructions?

A. Yes, sir, I find that Red Ball trains passing from Texarkana to St. Louis, passing through Little Rock at 2:50 in the morning, are delayed there until 3:45, or 55 minutes it is delayed there, under its own schedule; at Hoxie, it is delayed thirty minutes; Piedmont 30 minutes; De Soto 30 minutes.

Q. Does that involve an obstruction of the main track at those places for that length of time?

A. I said main or passing track; I think you will find that in my testimony; if a train is going right through, the better policy is to stand it right on the main track while the change is made; it may be put in the passing track; there may be a block of passing track.

Q. Those places that you enumerated are division terminals are they not?

A. Yes, sir.

Q. And are you aware that each of them has receiving tracks, and that the stopping of these does not affect the passing tracks at all?

A. I am not aware of that fact.

3095 Q. That is a fact, I am told; now, that would provide a convenient method of handling those trains, without disturbing the main line track?

A. Yes, sir, and it would incur a very great expense in providing a receiving track for these trains to pass on, the building and maintaining.

Q. Wouldn't these receiving tracks accommodate other trains besides trains carrying trans-state traffic,—state and interstate trains?

A. I don't understand that state traffic passes through in trains of that kind, but I understand that state trains are taken in and broken up and made up again at the terminal, and therefore, a receiving track would not be used for that purpose.

Q. What is the purpose of a receiving track?

A. To hold a train on until it is broken up.

Q. Couldn't it be used for any other purpose?

A. Yes, they could store cars on it if they wanted to.

Q. It could be utilized in any way?

A. Yes, sir, but they would have to clean it out every time a trans-state train came along, if they were running them.

Q. You made the statement that the local train when it gets into the station has already done the switching?

A. If it has followed its instructions.

Q. That the cars are all made up in order, and when the switching engine in a yard gets hold of the local, all it has to do is set out the cars.

3096 A. I don't think that there is; these are strictly Red Ball rules I am going by; if I had the general rules, the transportation rules, I could probably find that for you.

Q. Just a moment ago, in speaking about these receiving tracks, I understand you to state that the trans-state trains were not broken up like the local trains were, and for that reason the receiving tracks were provided for use of trans-state trains, because it would not be useful for other trains?

A. I did not say it would not be useful for other trains; I stated it would incur extra expense, if the receiving track was built.

Q. What I want to call your attention to is this. What is the occasion of breaking up these local trains if the switching has already been done before they come into the station; what occasion would there be for breaking them up?

A. Probably six were to go south, and six to go east, depending on the location of the terminal, and some were for the house track, and some were for private industries; they certainly are not going to let the train stay together.

Q. Then you must be mistaken in saying that the switching has been done when the train comes into the station?

A. I mean just in line with the Red Ball switching, as it has all been done, that they must carry them in station order, all
3097 house track cars must be together; all south bound and all east bound, if they have a south and east branch there, and all private industry cars must be together.

Q. What you should have said was, that when the local train comes into the station, it has already done its switching; then you say further, its cars are all made up in order, and when the switching engine in the yard gets hold of the local, all it has to do is to get the cars out?

A. That is it exactly.

Q. What you mean is that the cars are set in station order?

A. Yes, sir, the same as Red Ball trains.

Q. The Red Ball train being largely trans-state train, will come on the track at the terminal with the cars arranged in that order that the minimum amount of service will be required—I mean the condition the train is in will entail only the minimum amount of service that would be necessary to make the changes that are required?

A. That is true, if the train comes in according to rules.

Q. What changes that are necessary to be made in Red Ball trains would be less than in local trains?

A. You mean train for train? The work, car for car, would be the same, but as to train for train, work on the Red Ball would be considerably less than on local trains.

3098 Q. I mean train for train, and also with reference to tonnage they carry?

A. That would be train for train; that would be less on them, because all local cars would have to be handled and all of the trans-state cars, if it was a trans-state train, would not have to be.

Q. Now, in that connection then, I call your attention to a statement you made, in which you must be mistaken; you say that a through train going into a town like Little Rock,—that means I suppose on the Iron Mountain Railroad—and the local train going in with the through train would have three times as much work to do as the local train?

A. That is a stenographic error, I have not made a statement of that kind.

Q. You didn't intend to make that statement?

A. No, sir, not that there would be three times as much work to do on a local train.

JUDGE HILL: Read that please.

Mr. MOORE: "Why, the difference is simply this: that the local train when it comes in it has already done its switching; its cars are all made up in order, and when the switching engine in the yard gets hold of a local, all it has to do is to cut the cars out. They are already in order—the red ball in one place, the green ball and

other freight all broken up. That is the requirement that
3099 the local train shall bring its cars in in that way; while a through car comes in in the condition as it leaves the previous point. It is generally made up at the previous divisions or terminal point—and as near that condition as possible, but the services are virtually the same. They have the distributing of these cars around the different tracks, set them out and fill them to make a new train; set them away for the next morning; take them around to the different industry tracks.

"I should say that a through train going into a town like Little Rock, setting out its entire train, and a local train going into a town of that size, the through train would have three times as much work on it as a local train would, because more cars would be destined to Little Rock and more to be delivered."

A. That is a different proposition; you said a train going through; the balance of the answer shows something different; it indicates there are more cars destined to Little Rock, on that train, than there was on the local train; naturally, the trans-state train or train moving in more cars for Little Rock, would necessitate more work at Little Rock; I answered right upon that; really, car for car, it would be the same.

Q. The local trains will carry more cars that are destined to Little Rock than the other, and for that reason there would be more to do in breaking up that train than there would in the through train?

3100 A. I think that would be true; this is a different proposition; your question was that a trans-state train coming in would have three times as much work as the local; my answer is that a through train, I should say that a through train coming into a town like Little Rock, setting out its entire train, and a local train coming into a town of this size, the through train would have three times as much work on it as a local train would; that is a different proposition; that is correct, but the way you gave it to me at first, it was a stenographic error if it read that way.

Mr. HILL:

Q. You find it doesn't read that way?

A. No, sir, not as I understood from the Judge's question; that is, setting out its whole train in there, is the essence of the entire statement.

Mr. MOORE:

Q. What is the rule you have in mind in making that statement, that would govern the local train?

A. I mean if the Red Ball train comes in entire.

Q. I am speaking about the local; what is the rule for a local train that you have in mind in making that statement?

A. I mean that a local will have part of its cars which are through cars, going on to some other point, and all that will be necessary is to set the cars on another track, and that only a small portion
3101 of these cars on the local would be destined Little Rock, whereas in the Red Ball train, its entire tonnage would be for Little Rock.

Q. Not if it was a trans-state train?

A. Your question is, if it sets out its entire train; my answer was if it set out its entire train,—that is the whole thing in the answer.

Q. Let me call your attention now—I must confess I don't see the distinction you draw there; what you say is this, I should say, that the through train coming to a town like Little Rock, setting out its entire train, and a local train coming into a town of that size, the through train would have three times as much work on it as the local train because more cars would be destined to Little Rock and more be delivered there. Do you intend to distinguish between the through train and the local train in your reference to them there? Do you mean to indicate that all the cars in the through train are destined to Little Rock, and in the local train, all the cars are not destined to Little Rock?

A. Exactly.

Q. You didn't make that clear in your answer.

A. When I say "setting out its entire train" that means that its whole train is destined to Little Rock.

Q. You are speaking of a through train now?

A. Yes, sir.

Q. And immediately following, you spoke of the local
3102 train and you didn't qualify it.

A. Yes, sir, because the local train seldom has all its tonnage for the terminal it is going to; if I hadn't qualified the through train, it would not have had its entire tonnage for Little Rock, but I did qualify it.

Q. Have you ever known of a through train going to a station like Little Rock, with all its tonnage destined to that station?

A. Yes, sir; you put a question to me yesterday, if there was sufficient cars in a yard, you mentioned a yard somewhere, to make a solid train for Little Rock, would they put Texas cars in that train. and my answer was they would not, predicated upon the same question as my answer is here.

Q. I understand that these Red Ball trains are made of a large number of cars; let me ask you what Red Ball train consisting of fifty or sixty cars all destined to Little Rock, coming in either direction, from the Ft. Smith division or from St. Louis, wouldn't it be rather difficult to imagine a train of that many cars coming into a station like Little Rock with cars all destined to that station?

A. I wouldn't imagine they would handle fifty cars; I see their average is 33 cars.

Q. And perhaps there are twenty or fifty; I think the testimony in this case is some of them handle sixty cars?

3103 A. Possibly that is true, as it was with cotton; they handle from 23 to sixty.

Q. It would be a very remarkable condition for such a train as that to come into a station with its cars all destined to that station?

A. I would imagine it would.

Q. Where have you seen such a thing as that?

A. I saw a solid train come into Oklahoma City one time.

Q. All the cars destined to Oklahoma City?

A. Yes, sir.

Q. How many cars were there?

A. 30, 31 or 32; is was broken up there, unloaded and shipped out piece by piece; it was a train load of machinery.

Q. Is that a common occurrence out there?

A. No, sir, I don't think it is a common occurrence in any of our western states. I could tell you a condition that could easily bring that about; take a blockade, which very often exists on a railroad; take 1907, we had plenty of them where terminals would be absolutely blocked; say Guthrie was blocked, there was a blockade, and a Red Ball train would come in there; they might run a solid train clear down to Oklahoma City. Arkansas City, say, was blocked, and it would be thoroughly blocked up; they might make up a solid train and get those cars out of there; they might make up a solid train and send those cars to Oklahoma City.

3104 Q. Why do you attribute it to 1907?

A. Because there was more blockades then?

Q. Why was that?

A. Because of the panic, on account of the increase in the business; it was considered the banner year of railroads in our country.

Q. What time do those blockades accur?

A. They were blocked up as late as November; I was in Mexico at that time; I know our freight was blockaded in the United States as late as November; after I came home, for two or three months, I never thought of blockades or anything else; I was working too hard and had my mind on other things.

Q. Was the condition exceptional that fall?

A. It was considered so; I have seen solid carloads of merchandise sit on side tracks, which railroads would not do under ordinary circumstances.

Q. That was a very abnormal condition?

A. Yes, sir, I said it was. I will say it was as abnormal as you want me to.

Q. Referring now to the question as to the relation between state and interstate traffic, and assuming that the rates from Memphis to points in Arkansas are based on Arkansas state rates, and that rates from St. Louis are based on the fixed differential over the rate from Memphis, and say that the rates from Pittsburg are based upon a fixed differential over the rate from St. Louis, I want to ask

3105 you what you would say, if you wouldn't say that the state rate did affect the interstate rates to the extent that these several rates are based in the manner which I have mentioned?

A. I am sorry I cannot agree with you Judge, but I find that the Memphis-Little Rock rate is 86% of the first class rate; the St. Louis-Little Rock rate is 85%, that is the second class; the third class, Memphis-Little Rock rate is 64; the St. Louis rate is 65; the fourth class Memphis-Little Rock rate is 51.4; the St. Louis is 49; the fifth class Memphis-Little Rock rate is 38.6, St. Louis-Little Rock, 37.

Class "A" is 41.4 against 39.

Class "B" 31.4 against 32.

Class "C" 25.7 against 27.
Class "D" 21.4 against 23.
Class "E" 17 against 18.

Now, those certainly show that they are not applied one with relation to the other; there is only about 3.4% variation in the scale.

Q. Referring to the Little Rock rates which you have just recited out, and applying it to the State of Arkansas generally, I ask you if the rates from Memphis into that state are the Commission rates plus the bridge arbitrary, and then the rates from St. Louis and Pittsburg and these other places I mentioned are applied in the way I have stated, wouldn't that indicate there was a relation be-

3106 tween state and interstate rates?

A. If there was a certain arbitrary added to the state rate to make the St. Louis rate, and a certain arbitrary added to the state rate to make the Pittsburg rate, I would say that there was a relation between them, but the percentages in existence from the actual rates, show that there is a difference of only 3.4%.

I have thought of a further proposition in answer to the last question; the differentials that would be added to your state rate as from class to class, would necessarily be the same percentages as between class to class as the rates were; in order to hold the relationship.

Q. Assuming that the differentials are fixed?

A. Unless they are fixed with some relation to classes as the rates are built——

Q. They are fixed.

A. Then that condition in the state would exist.

3107 Redirect examination.

By Mr. HILL:

Q. Mr. Moore has put to you some rates on lumber, 22 cents from Louisiana to Little Rock and 14 cents from points in Arkansas to Little Rock. I will ask you if that necessarily would mean that the lumber could not move from Louisiana points into Little Rock on a 22 cent rate, and if not, why?

A. I wouldn't think it would prevent the movement, Judge. It has been my experience with the manufacture of lumber in the Western part of Arkansas, and the Eastern part of Oklahoma, those being the two fields I am familiar with, and the Southern part of Oklahoma, it costs more per thousand feet to manufacture that lumber—at least that is the testimony of the mill men, their figure being approximately $3. and $3.50 per thousand to manufacture that lumber; and it was further testified, that lumber was sold F.O.B. destination, and that a difference in the rate was absorbed by the lumber mills.

Q. There would be another factor entering into that; suppose a man could buy stumpage in Louisiana much cheaper than he could in Arkansas?

A. That would be included in that $3.50, I suppose; I don't know anything about the price of logs, etc.

Q. In other words, the lumber dealer, if he has sufficient
3108 margin of profit, can absorb the difference in rate?

A. The lumber mill man absorbs it; it was testified there before our Commission, by all the lumber dealers from our state—I mean a large part of them; I suppose there was forty present, and they testified that they were quoted the same price on Oklahoma lumber as they were on Louisiana or Texas lumber. There seems to be a margin of 50 cents or a dollar a thousand, and sometimes it would vary one way and sometimes another, it appearing that some of them wouldn't get figures in line quite quick enough, but freight rates seem to make no difference in the price of lumber, and I should judge the same condition exists in Arkansas.

Q. Mr. Moore detected a mistake you had made in your calculations in illustrating L. C. L. interstate and intrastate; you have, haven't you corrected that mistake?

A. I called the calculation this morning, but I would like to correct it; now, I say that the figure on interstate traffic would be $1.90 per ton. The figure on state traffic would be $3.84 per ton, a difference of $1.94 per ton, or an excess of 4 cents per ton over double the revenue received from the interstate traffic.

Q. Does that correction of your calculation change the proposition that you were illustrating with it?

A. It don't change the proposition in the least, except that I made the statement that there was a dollar and four cents more
3109 revenue to the railroad companies on state traffic than double what they received on interstate traffic, whereas it should have been four cents, but they receive, not only the same $1.90 from state traffic as they receive from interstate traffic, but they receive another $1.90, and then four cents additional, to take care of one additional terminal and other slight expenses chargeable to state traffic.

Q. A good many times, in his questions to you, Mr. Moore put assumptions to you on the theory that all interstate business had one handling, except trans-state and it had no handling in the state, and that all intra-state business had two handlings; is that theory true in fact?

A. I don't think it is judge; it has not been true in freight that I came in contact with, but as I explained thoroughly in my direct-examination, and I think in answer to Judge Moore's questions, this morning, that traffic from St. Louis destined to stations around Little Rock, would be handled to Little Rock, possibly they are unloaded, reloaded into peddler cars, and then handled to destination.

Q. I call your further attention to the fact that both Memphis and Fort Smith have an L. C. L. traffic that goes into the exhibits in this case as interstate business, as well as carload traffic; I presume you are sufficiently familiar with the local conditions to know the kind of handling that traffic would get?

A. It would get two within the state, considering that for
3110 the purpose of this case Memphis is considered within Arkansas.

Q. And the same is true of Ft. Smith?

A. Fort Smith is in Arkansas.

Q. It is an interstate point on account of the freight having to go out of the state?

A. Yes, sir and come back into the state.

Q. And so treated in the exhibits in this case?

A. Yes, sir, Memphis is an interstate point but for the purposes of this case, it is treated as an Arkansas point; all that traffic would have at least two handlings.

Q. You have already, in your direct examination, given the various handlings of grain and cotton and other interstate commodities?

A. I have.

Q. Mr. Moore referred to the Arkansas Commission making a 13 cent rate on sugar applicable from Helena to Texarkana, which reduced the New Orleans to Texarkana rate from something like 27 or 28 cents, I think it was, down to 23. I will ask you if those are good illustrations of the cost of service?

A. No, I didn't see where the cost of service would figure in this at all.

Q. It was a commercial condition that the railroad Commission—upon which the Commission forced a lower rate to Texarkana on sugar?

A. That is what it occurred to me to be; not knowing of any movement from Helena to Texarkana other than inter-
3111 state sugar, and it would appear to me to be made for the purpose in some way of reducing the interstate rates.

Q. I suppose your Commission where it finds there is some unjust rate, would put in some rate that would bring about what they deemed a reasonabler ate?

A. We only had one time that the Commission did that, as I testified yesterday.

Q. I think this is the only occasion it is shown that the Arkansas Commission did that; I think they ought to have done it oftener than they did. Mr. Moore had you make several comparisons of the rate per ton per mile on grain, stone, coal and cotton, and after getting the figures, he carried you into a rather extended comparison between cotton and stone; he didn't carry the comparison into grain and stone; does that run?

A. The rates on stone and grain in our state, stone is just little lower than grain.

Q. How does the cost of service on stone and grain compare?

A. I imagine that there is a much heavier cost on grain than on stone.

Q. How about the casualty risk on grain?

A. That is an item I am figuring on; the handling of grain, starting with its first loading is more expensive; the railroads must furnish what is known as grain doors, and must see that the cars are properly prepared for the handling of grain. They must pick good cars that have no leaks in their roof, and the cars must be swept and properly prepared for grain handling, and the
3112 grain then moves into the milling point—at least a large part of it does, where it is unloaded and the car sent back,

or held or used for other purposes, and when the milled product is ready to be used, another car is sent forward, loaded again, the same care being used to pick a good car.

Stone will move in a flat car, cattle car, any car they can get hold of, with sufficient foundation to hold the weight, and carried to its destination. If a car of grain should be wrecked, there would be a very heavy loss; if a car of stone should be wrecked, the loss would be the cost of re-loading.

Q. Is there not very large claims against grain shipments, not on account of wrecks, but on account of leakage and such things?

A. Yes, sir, that is a very heavy element of claim.

Q. These are voluntary rates you are referring to?

A. They were voluntary rates, yes, sir.

Q. Interstate or state?

A. Both state and interstate; the grain, of course, is interstate.

Q. What is your opinion of the representation of the cost of service as reflected in those two respective rates?

A. There is no representation of the cost of service between the two rates.

Q. Here is what I wanted Mr. Moore to call your attention to in Mr. Becker's testimony, that he did not see proper to do

3113 (Page 475, vol. 2).

"Q. There are you know, published exceptions in Texas to the Western classification?

A. Yes, sir.

Q. Why is it that Texas has worked out so many exceptions?

A. They have a commission who makes its own ratings and exceptions; what governs them I don't know.

Q. I refer to the interstate tariff where there are exceptions?

A. Those are in the nature of commodity ratings?

Q. They amount to exceptions, don't they?

A. Yes, sir; and you ask what makes that necessary?

Q. Yes.

A. I presume commercial and competitive conditions.

Q. Those Texas exceptions to the western classification apply on the traffic moving from St. Louis to Texas, do they not?

A. Yes, sir.

Q. All the trans-state traffic that moves through Arkansas or St. Louis to Texas, would be governed by the exceptions to the western classification, made to fit Texas conditions, wouldn't it?

A. That would be my understanding.

Q. Does your committee give consideration to commercial and competitive conditions also in making the classifications?

A. More or less, not to the same extent, of course, "that

3114 governs in commodity rating. You know our classification covers over quite an extensive territory, and there might be local conditions that would make it necessary to except to that classification."

I will ask you if your experience agrees with that of Mr. Becker on that line? Your observation of the classification?

A. Yes, sir, there are numerous exceptions, and they are brought

about, I wouldn't say entirely that commercial conditions bring them about; the railroads are often desirous of making exceptions.

Q. I think the testimony would indicate that the Western classification committee even considers competitive conditions?

A. It does, there is no doubt about that.

Q. You and Mr. Moore have discussed at great length the trans-state trains—supposedly trans-state trains—as a matter of fact, I believe you have explained that there were very few of these. I want to know what difference there would be in handling or switching one trans-state car say from one line of the Iron Moun tain to another, at the terminals, and picking up and placing a car from a local, at an industry track; to illustrate, suppose, they have got a trans-state car coming down the White River Branch that would strike the main line at Diaz and be switched on to some other train to be carried to New Orleans or Texas as the case might be, and at Newport, right below there, there would be a car picked up from an industry track; what would be the difference
3115 in the handling of those two cars so far as the switching movement is concerned?

A. There would be a little difference; the engine switching from the White River train would probably handle more than one car, and I imagine that the service would be performed about as follows: The White River train would come in, and the engine would take the cars off that were going to be put in other trains, or destined through going in other directions; those cars would be set out first on one track, to let that car go on if it was going on; otherwise the train would be broken up and the cars placed on the particular tracks relative to the other trains; if it was a classification yard, then when it came in, to make up this other train, they would go and pick this car up and switch it around until it got in its proper place.

Now, picking up the car from the industry track, the difference is that the engine would have to go to the industry track; it might, in that journey, pick up six, seven, eight or ten cars, and if the industry track was located in a reasonable distance, I should say less than a mile from the yard proper, the switch track the train is to be made up on, and there are six or seven cars taken out of that industry track, there would be very little difference in the expense? As soon as that came back in the yards, it would have to go through the same operation as the trans-state car would, and if they simply picked up one car, they would have the expense of that
3116 switch engine going out there to that industry track and taking off one car, as compared with the work of the switch engine in taking the trans-state car off the White River Branch train, with six or seven other cars, and that pro rata part would be its only expense.

Q. This morning Mr. Moore was asking you some questions about the carrying capacity of trains, and gave you an illustration of the rating of locomotives; I hand you a list showing the capacity of different classes of engines, used there on the Arkansas Division, and here is the capacity of different classes on the White River

Division. I wish you would look over those, I don't suppose you have had an opportunity to see them.

A. These seem to vary from 350 tons to 2400 tons per engine on different divisions and different engines.

Q. Take a movement through from Hoxie to Texarkana, one of those bridge movements, where the cars go through on a bridge, show the ratings of the engines here, and what effect that would have on your train?

A. These districts read straight down, do they? Hoxie is first, Little Rock second, and Pine Bluff third?

Q. Pine Bluff would be on a branch; Hoxie, Little Rock and then Texarkana would be on the main line?

A. Hoxie, Argenta, and Argenta to Texarkana, that would be the main line would it?

Q. Yes, Argenta is the yards across the river from Little Rock.

A. If a Red Ball train came out of Hoxie or otherwise, if
3117 it has its full tonnage, it would have to set part of those cars out when it got to Argenta.

Q. Why?

A. Because it carries 1500 tons up to Argenta and from there south, it could only carry 1200, so it would have to set out 300 tons and if you figure the average cars at 33 1/3 tons—that is a little light, but it will make the figures even,—to handle three cars would be 100 tons; that would mean setting out six cars off the train.

Q. Take the White River right before you; you see one represents the haul north and the other south?

A. Take a train starting out of Carthage, Mo., moving to Crane, any engine between 851 and 893 would carry 975 tons to Crane; between Crane and Cotton, it would reduce its tonnage 375 tons, and then from Cotter to Batesville, it would reduce its tonnage 800 tons. From Batesville, if it was going back in the back direction from Batesville to Cotter, it would carry 1200 tons, but going on south, the shipment has been raised from Cotter to Batesville to 800 tons; then from Batesville to Newport, the train would have to reduce 700 tons.

Q. Then from Newport to Argenta, is that shown on that, or would that be on the other sheet?

A. Yes, sir.

Q. There wouldn't be very much bridge movement on transstate freight with that kind of capacity of the engine?

A. Not unless they started with an under-tonnage train; a very light train; an engine would be losing the value of its
3118 capacity if it was making a bridge movement.

Q. I am just using the expression of Mr. Doddridge which was emphasized by Mr. McPherson?

A. I simply meant, going through that picking up or setting out, it would lose its character.

Q. Mr. McPherson told us about a lot of grain going over that White River Division, passing over a bridge from Carthage to Diaz, and then I suppose it would go down the river line from Bald

Knob; what do you think of that kind of a bridge which it would be on?

A. There couldn't be any bridge service except from division to division, because the same engine would carry different tonnage on each division, and it would be necessary to set out and pick up all the time to keep that engine at its maximum capacity, and unless it was so kept, the railroad would lose money by running it.

Q. If they didn't get it up to its rating, it would be very poor railroad operation?

A. They will get it to the rating if they have the rating to give it; an engine will not go out light unless it is a peculiar condition.

Q. They keep it at its rating by picking up and setting out, don't they?

A. Yes, sir.

Q. Whether it is a bridge or not, that is a pretty good railroad movement?

A. It is the only feasible practical movement in my opinion.

3119 A man would be foolish to run an engine across a division with only 700 tons, if it would carry 1200 tons.

Q. It might be pretty good railroading, but it would knock the theory of trans-state trains?

A. The through trans-state trains, it would knock it entirely.

Q. Here is a statement that you made in your testimony, I don't know whether it is sufficiently explicit to carry out your meaning. Mr. Moore is assuming some facts to you: "Assuming those two facts, that it costs more and the rate was higher, which would represent the cost of service better, the revenue or the ton miles?"

Your answer was: "The revenue would nearer represent the figure that would represent the cost of service; wouldn't any figure represent the cost of service, but the revenue would be nearer than the ton miles would; that would be presuming they both moved the same distance under the same conditions."

I wish you would explain that a little more?

A. I meant that if a shipment originating at Little Rock and moving to Gurdon—I see that is a point on the Iron Mountain in Arkansas; now, if there was a shipment of baskets and a shipment of bar iron, both moving from Little Rock to Gurdon, both weighing the same amount, I mean to say that the cost of that service could nearer be estimated by the revenue received, if the revenue was in the proper ratio.

3120 Q. It was not any assumption that the revenue was in the proper ratio?

A. No, sir, I say if the revenue was in proper ratio, then it could be estimated by taking the ton miles. If the revenue was in the proper ratio to the liability and space consumed and all the factors which enter into the making of the rate, it would be a better factor in making the per cent.

Q. Suppose baskets were classified at less than wire rope was classified, how would the revenue then represent the cost of service?

A. It would be a very poor representation of the cost of service,

because a railroad could well afford to handle four or five hundred pounds of wire rope where they could afford to handle 100 pounds of baskets.

Q. Mr. Moore questioned you somewhat about this Cotton Belt exhibit, showing their increased earnings in January, 1909, and you stated that on the face of it, it did not necessarily mean an increase in the rates, as I remember your testimony.

A. You misunderstood me; I said that upon the figures given me by Judge Moore, that the ton miles had been increased, that it meant nothing upon its face.

Q. Have you looked into that any further, and found out whether those figures compared with the six months' period involved in this case, mean anything?

A. I have.

3121 Q. Give us the result?

A. I find that in the six months' period in the Cotton Belt exhibit, and I don't remember the dates,—that the total ton miles was 8,512,807, producing a revenue of $163,064.45; I have divided both of these factors by six, as I understand this is a six months' period, and it gives me a figure of 1,418,968 ton miles, with a revenue of $28,844. plus. In the month that is spoken of, there was 775,493 ton miles, with a revenue of $30,916.20. In other words, for 1/6th of the six months, they handled nearly 700 tons more for practically $2,000 less.

Q. What would that naturally indicate?

A. An increase in the rates.

Q. Probably some prohibition on the high rates moving the stuff too?

A. It decreased the traffic, there is no doubt about that, and increased the gross revenue, and I should judge from it, it decreased the movement of low commodities; not being able to go into the matter any more than I have, I should judge it would decrease the low commodities.

Q. You know Mr. B. M. Flippin of the Iron Mountain Railroad?

A. Very well.

Q. I want to read you from page 252, vol. 1, of his testimony in this case:

"Q. I stated that it is claimed by your side, that the rates
3122 of November 2nd, 1908, are about 42% higher than the Commission rates, but I will ask you if in readjusting the interstate rates, you raised them 42% higher than the pre-existing rates?

A. I don't think the measure of difference in interstate rates was the same percentage, because of the fact that the adjustment relatively was already very much higher. The rates within the state of Arkansas, under the Commission's tariff, were inordinately low, and therefore, when we came to the point of advancing the interstate rates with relation to the state rates, we didn't have to observe the same comparison.

Q. About what percentage of increase did you put upon the interstate rates?

A. It varied according to the commodity involved.

Q. Of course, it always does that, but I am speaking generally of about what would be the average increase?

A. I should say from ten to fifteen per cent."

Take that testimony in connection with an increase of nine and a fraction per cent in the interstate revenue shown in the January exhibit, and the 96% shown there as against the admitted increase of 42% in the state revenue, what conclusions would you naturally draw from it?

A. That they had increased the state rates more than the interstate.

Q. Very considerably too?

A. Yes, the figures show that.

3123 Q. In referring to this cotton movement, Mr. Watson and Mr. Moore gave you some figures yesterday on the rate per ton per mile on the cotton movement; did that take into consideration the amount the railroad paid to the cotton compresses?

A. I didn't understand that it did; I don't know whether that was deducted first or not. I don't presume it was, because he quoted me rates.

Q. What is the custom about who pays the compress charges—the railroad or the shipper?

A. The railroad; it is always taken at the railroad's option of compressing.

Q. Take the illustration of oranges, and other citrus fruits, from Los Angeles to Little Rock and New York. On cross-examination you were cross-examined at great length on that. I brought out that the rate from Los Angeles to Little Rock was the same as the rate from Los Angeles to New York. I would like for you to estimate if you could, the difference per ton per mile on that car that would go from Los Angeles to Little Rock and one that would go from Los Angeles through Little Rock to New York?

A. You will have to pass that question for the present until I can get the distances.

Q. Coming back to cotton for a moment, I believe you stated that cotton was moved from compress points and other

3124 points in the nearby territory on the same rate; is that true?

A. Yes, sir, as a general proposition, it is true.

Q. Take as an illustration of that, a matter that I happen to know of that has been recently developed in the case. The rate from Paris, Arkansas, on the Arkansas Central, which is 42 miles from Fort Smith, is the same as from Ft. Smith, and that cotton is shipped in there, compressed there and shipped out on the same rate as another bale that was raised near Ft. Smith and was carried in there and compressed and shipped out. I will ask you if that is a fairly illustrative example of the cotton movement from small towns into the compress points?

A. It is. I have known of distances being twice that though.

Q. Then that movement from Paris to Fort Smith would represent the local haul?

A. Yes, sir.
Q. And there would be two handlings?
A. Yes.
Q. Before it took up with the other bale that had no other handling, until they both started out of the compress?
A. That is true.
Q. And it would be the same rate?
A. Yes, sir.
Q. There would be some little difference in the cost of service, I should infer?
3125 A. I should imagine there would be considerable difference in the cost of service, because that would be handled on that very expensive local train and handled as L. C. L. freight, loaded and unloaded by the railroad company.
Q. You stated to Mr. Moore yesterday that you didn't know the exact divisions made on this cotton, citrous fruits and other things, but do you know that some division is made with the other lines?
A. From my general knowledge of rates, knowing various through rates, I know there is a basis of division.
Q. What are the usual bases of division?
A. Either an arbitrary which one line demands; a constructive mileage basis, which is allowed one line and that generally is where a line performs a very short haul, or a mileage pro rate. Those are the three general divisions used.
Q. Where these different ones are used, it would affect the amount of revenue that is being credited to the State, and this trans-state and other interstate business, wouldn't it?
A. Naturally.
Q. I want to submit to you an affidavit made by Mr. C. K. Vorhees, which was filed in this suit on motion to dissolve injunction, before the Circuit Court of the United States at Little Rock, in the spring of 1909. I presume you know Mr. Vorhees?
A. Very well, he is general freight agent of the St. Louis & San Francisco Railroad.
3126 Q. On page three, he states:
"Affiant states that the representatives of the several lines discussed and considered the relations which should exist between the several class rates, and after much study and comparison with the rates in other states and with the class rates applied on interstate traffic in various portions of the territory west of the Mississippi River and other elements affecting the fixing of class rates, it was decided to recommend that the various classes should bear the following relation each to the other:

| 1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E Classes. |
|---|---|---|---|---|---|---|---|---|---|
| 100 | 83⅓ | 66⅔ | 50 | 40 | 45 | 30 | 30 | 25 | 20 Percentages." |

Are you familiar with that which I presume is put forward by Mr. Vorhees as the ideal relation of one class to another?
A. That scale looks very much to me like what is known as the Minnesota scale, and which has stood the test of the Supreme Court

of that State; I would not be absolutely positive, but it appears to me as very close to the Minnesota scale.

Q. That is presumably considered by those who made it, the ideal scale?

A. It is so considered at present, but I am sorry to say it is not in use anywhere except up there, that I know of.

3127 Q. From page 4 of Mr. Vorhee's affidavit, I want to take what he gives as the rates that were applicable; these are all interstate rates applicable at the time of the injunction in this case; he first gives those from Memphis to Little Rock:

| "1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 70 | 60 | 45 | 36 | 27 | 29 | 22 | 18 | 15 | 12" |

Then the rates from Memphis to Fort Smith, distance of 302 miles:

| "1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 102 | 87 | 67 | 49 | 40 | 42 | 35 | 30 | 28 | 23" |

Then the rates from St. Louis to Little Rock, a distance of 345 miles was:

| "1st | 2nd | 3rd | 4th | 5th | A | B | C | D | E |
|---|---|---|---|---|---|---|---|---|---|
| 100 | 85 | 65 | 49 | 37 | 39 | 32 | 27 | 23 | 18" |

Now, with those before you, I will ask you if they illustrate the point that you were making in your cross-examination, that there was no proper relation between the classes in the interstate tariffs with which you could compare or establish a relation with the state tariffs?

A. They are. I had all those percentages figured out, but they seem to have disappeared; I read them into the record this morning; I read all the interstate rates in, and I had the state rates figured out as to the percentages of those. I believe forty miles is supposed to be the average haul in Arkansas.

3128 Q. 42, I think it is?

A. I have taken 40 miles; now, I will call four columns, the first column will be the Memphis to Little Rock rate, the second column will be the Memphis to Ft. Smith rate, the third column will be the St. Louis to Little Rock rate, and the fourth column will be the Arkansas Standard Distance Tariff #3, for forty miles:

| | M.-L. R. | M.-F. S. | St. L.-L. R. | ASDT. #3. |
|---|---|---|---|---|
| 2nd | 86 | 85.3 | 85 | 90 |
| 3rd | 64 | 65.7 | 65 | 80 |
| 4th | 51.4 | 48 | 49 | 66.6 |
| 5th | 38.6 | 39.2 | 37 | 50 |
| "A" | 41.4 | 41.1 | 39 | 53.3 |
| "B" | 31.4 | 34.3 | 32 | 40 |
| "C" | 25.7 | 29.4 | 27 | 30 |
| "D" | 21.4 | 27.4 | 23 | 26.6 |
| "E" | 17 | 22.5 | 18 | 23.3 |

Those are the percentages of first class rate in each class. Now, that shows that the relation of the interstate rates to the state rates for the average haul in Arkansas, is not relative at all.

Q. There is not one of those interstate rates where you could make the relation so it would fit in with another?

A. No, sir.

Mr. MOORE:

3129 Q. Are those the rates in force now?

A. No, sir, the ones in 1907, I understand.

Mr. HILL:

Q. Were those rates Mr. Vorhees has been testifying about, the interstate rates in force at the time of the injunction?

A. Yes, sir, these are the rates I took from that affidavit, and 40 miles distance rate in Arkansas.

Q. If anybody wants the job of figuring out which one of the interstate schedule of rates you would have to figure on, he would have a pretty difficult job?

A. I wouldn't like to have to take it up.

Q. Here is a scale of miles that Mr. Hamilton has gathered up, illustrating the proposition I asked you about, that you can use in answering the question I propounded awhile ago on orange shipments to Little Rock and New York from Los Angeles.

A. This table appears to show that the distance from Los Angeles to Little Rock, via El Paso and Texarkana is 1815 miles, and the distance, Los Angeles to New York, via El Paso, Texarkana, St. Louis and New York, via Pennsylvania Lines, 3219 miles, the distance to Little Rock being 56 decimal per cent of the through distance, and if the same rate applied from Los Angeles to New York, it would mean that the revenue per ton per mile would be cut down in just those relations.

3130 Recross-examination.

By Mr. MOORE:

Q. Why do you use forty miles as the average length of the haul in the table you have just prepared?

A. I understand about forty miles was the average length of the haul in Arkansas.

Q. The figures furnished you in the affidavit of Mr. Vorhees were the voluntary rates put in by the railroads after the injunction was granted in this case?

A. No, sir, I understood they were in prior to that.

Q. You stated that the railroad companies paid the compress companies?

A. I said that was the general practice.

Q. For what service is that paid?

A. Compressing, marking and patching.

Q. Does it not also include on the lines in this litigation, the loading and unloading of cotton at compress points?

A. That I don't know. I don't understand that it covers loading and unloading; in our state, it includes, compressing, patching and handling in the way of putting new ties on it, making it in such condition that it can be shipped.

Q. If it is true that ten cents a hundred is paid by the railroad company to the compress company for all services connected with cotton, including loading and unloading at compress points, that would cover the service which you have stated on this examination, was rendered by the railroads wouldn't it?

3131 A. It would partially cover the services.

Mr. HILL:

Q. Who pays that, the railroad or the compress?

A. The railroads.

Q. Pays it to the compress for the services?

A. Yes, sir.

Mr. MOORE:

Q. As I am informed, the railroad companies pay the compress 10 cents per hundred pounds, and that includes loading and unloading. Your attention was called a moment ago to the increase in revenues shown on the exhibits of the Cotton Belt Railroad in January, 1909. In order to know to what that is due, what brought that about, you would have to know something in regard to the shipping of commodities during the two periods?

A. To know the exact reason for that, yes.

Q. Suppose that in one period the tonnage was composed of lower grade commodities than it did in another, that would change the revenue derived from it?

A. It appears that it does.

Q. For that reason, it would be necessary to have a knowledge of the extent to which the character of commodities, whether low or high grade shifted, in order to know what caused the increase?

A. To perfectly analyze the statement, yes, sir; I stated that in my answer.

Q. You were asked and you made a statement in regard to the effect of the engine capacity on the White River Branch,

3132 upon the handling of trans-state freights; I believe you stated you knew the top geography of the country pretty well and of the railroad lines; is there any trans-state freights handled on the White River Branch of the Iron Mountain Railroad?

A. I understood Kansas City grain goes down that branch.

Q. Where does it connect?

A. I don't know exactly; I only asked a few general questions, and did not go into detail.

Q. I think there is a connection there at Carthage, but you don't know the amount of trans-state tonnage that passes through there?

A. I do not.

Q. Do you know anything about the physical condition of that road as to the grades?

A. No, sir, nothing except the knowledge I get from the rating of the engine sheet; I get a pretty good knowledge from that.

Q. What do they indicate in regard to grades?

A. They vary considerably; some places they must have the minimum and some places the maximum; that indicates over there that the cost of service on one division would not be the cost of service on another division.

Mr. HILL:

Q. The revenue would be the same, wouldn't it?

A. Absolutely.

Q. I see in this statement of the capacity of the different classes of engines, taking the Hoxie district, numbers 438 to 457
3133 and 501 to 545 are rated at 1500 tons?

A. I presume so, you have the paper; the variation appears on the engine rating, regardless of the engine number.

Q. I notice certain other numbers are rated at different rates, say 1250 and so on; the object of that is to show the classification of these engines?

A. Yes, sir, show what every engine run on the road can pull over a given division.

Q. That means 438 to 457 can pull 1500 tons in the Hoxie District?

A. Yes, sir, over the division stated.

Q. And then it means that engines 2302 to 2347 can pull 1250 over that district?

A. Yes, sir, it means they are poorer grade engines than the others.

Q. In other words, it is to show the grading of the different groups of engines?

A. Each engine specifically.

Q. Of each of the engines that is embraced within the numbers that is contained here in this tabulation?

A. Yes, sir, and supposed to contain every engine on the road.

Q. We have about 60 engines with a capacity of 1500 tons?

A. Yes, sir.

Q. Then we have forty or more of 1250 tons?

A. Yes, sir, some number of engines.

Q. Now, I see the Little Rock District runs the same way, as to the capacity of the engines, except that the capacities are
3134 different.

A. Yes, sir, it is lighter, I believe.

Q. But the purpose of this is to give information as to the capacity of these engines on that route?

A. The purpose of that statement in that official time card is to advise employees as to what tonnage they must load on the engines in pulling them from division to division; I think there is something else that goes with that that is not there, and that is a statement of the penalties that are added for the number of cars; it would be a peculiar rating if it didn't carry that with it; they probably carry it with the book of rules; an engine couldn't carry 1500 tons of empty cars.

Q. Now, one of these sheets to which your attention was called, gives the capacity of engines on the main line, doesn't it?

A. Yes, sir, that is what I understand.

Q. And another one gives the capacity of engines on the White River Branch?

A. Yes, sir.

Q. Those engines on the White River Division are an entirely different class of engines adapted to grade and conditions?

A. I don't know about that.

Q. From your general knowledge, wouldn't you know about that?

A. They might run another engine on that division; they
3135 would rate it accordingly when they got it over there; I suppose some engines are shown on different divisions.

Q. Look at the list and see if they are the same or different engines?

A. They seem to have different engines on different divisions.

Q. Isn't the class of traffic different on the White River Division from that on the main line, and on the Pine Bluff and Fort Smith Branches?

A. Generally speaking, I should say the traffic was heavier on the main line; I wouldn't imagine the character of traffic was any different.

Q. I mean the density of the traffic?

A. I should imagine the main line traffic was more dense than on the branch line; if you would want my opinion, I would say the best engines are on the main line.

Q. You undertook to describe the switching process at Newport; have you any knowledge acquired from observation, as to the manner of switching cars at Newport?

A. I have not. I described the general switching arrangements for conditions as I described them.

Q. Referring to your statement in regard to making a comparison of rates between grain and stone, wouldn't the value of the comparison be entirely influenced by the amount of grain moving and the amount of stone?

A. There is not a balanced reciprocal movement of grain,
3136 and there is of stone.

Q. There is on grain on Arkansas lines?

A. I was testifying as to the rates in Oklahoma.

Q. The question I asked you is whether there is not a reciprocal tonnage in very much larger volume on one than on the other, that would influence the comparsion?

A. It would have an effect upon it.

Q. The testimony in this case shows that those cars that haul grain south go back loaded with other tonnage in our state, on these lines involved, both of them.

A. We contend in our state that the empty movement is northbound; the stone movement is northbound, and the grain moves south.

Q. You have revised your figures on the revenue per ton on interstate traffic as shown on Exhibit 26?

A. I did that this morning.

Q. I see that you have still used the average haul of state L. C. L. freight for the purpose of ascertaining the average revenue per ton on interstate freight?

A. Yes, sir, the only thing I did was to revise the error I made in carrying one figure.

Q. In other words, to ascertain the revenue per ton on interstate freight, you multiply the revenue per ton per mile by the average length of the haul of state instead of interstate?

A. Yes, sir, in order to show the revenue accruing to the railroad from the identical movement in the state, and the interstate over that very piece of track.

3137 Q. And in doing that, you utterly disregard the difference produced by the difference in the long and short hauls, do you not?

A. I do, because it doesn't figure in the proposition that I used; I was trying to show that the state freight did pay an extra premium on account of its short haul, and it was the very reason I used those figures to show that it is based on the same figures that the long haul is based on, and in addition to the same figure again, four cents additional.

Q. In comparing the terminal handlings of state and interstate L. C. L. freight, you attribute two terminal handlings to state freight, and what number to interstate?

A. Some of it will have one, some will have three; I went into that largely this morning.

Q. You base your assumption of three handlings upon the proposition that you described here this morning, it was loaded, came in, unloaded, and perhaps back-hauled?

A. Yes, sir, and the further condition of traffic from Fort Smith and Memphis which I did not take into consideration this morning.

Q. Do you know the relative volume of Ft. Smith traffic as between state and trans-state?

A. No, sir, I haven't the least idea.

Q. I believe you stated the action of the Arkansas Commission in rating sugar in the connection to which I called it to your attention on cross-examination, was a commercial condition

3138 forced by the Commission; wasn't it rather a rate making condition forced by that commission?

A. It was a commercial rate condition; it was certainly a commercial condition, if they reduced the price of sugar.

Q. Why did you regard that as a commercial condition?

A. They reduced the price in sugar as they reduced the rate on it; it was a commercial condition governing the rates, was what I intended to convey.

Q. Isn't it a rate condition governing the commercial condition?

A. Either way you want to put it; what I want to draw is the idea that it was not a proposition of cost.

Q. What you meant was that the action of the commission had resulted by reducing the rate on sugar and consequently reducing the price of sugar?

A. I presume it did.

Redirect examination.

By Mr. HILL:

Q. In speaking of this Cotton Belt statement of January, 1909, Mr. Moore asked you about the fluctuations in the commodities; judging from your knowledge of the situation generally, would there be any fluctuation as between state and interstate that would be material in any one month?

3139 A. Not unless some unusual condition brought it about, I don't think there would.

Q. You would look for information to the relative tonnage of each commodity in any given month of the year?

A. Relatively there might be a condition that something would move heavier in one month than in another.

Q. That would be an exceptional condition?

A. Yes, sir, ordinarily a man would look, month in and month out for the same.

Q. In using that word exceptional, Mr. Moore put a good many questions about exceptional rates, competitive rates and commercial conditions, which governed in making of rates, and things of that kind; I believe you and he fell into the habit of calling them exceptional rates; where does the volume of traffic move, is it under those kinds of rates?

A. It moves under those exceptional rates; I specified this morning it was exceptional but a general condition; I think the larger part of the traffic moves under commodity rates; they might be called exceptional rates; they are exceptions to the classifications found necessary from commercial and other conditions.

Q. By speaking of them as exceptional, you don't mean by that, it is a rate of insignificance?

A. Not by any means; there might have been some specified condition where I used the term exceptional.

Q. The commodity rate is usually regarded as an exceptional rate?

3140 A. Yes, sir.

Q. There are more movements under commodity rates than under the classes, I suppose?

A. Much larger.

Q. Speaking of those class rates, just one further idea about that; how do Arkansas class rates in Standard Distance Tariff compare with the voluntary class rates in force in Oklahoma?

A. They are much higher than the voluntary class rates in Oklahoma which move the volume of the business.

Q You mean the jobbers' rates?

A. Yes, sir, we have two standards, jobbers' rates and common class rates; the jobbers' rates move a very large part of the traffic.

Mr. Koonce admitted on the stand that 85% moved under them, and I figured that 93% moved.

Q. We had in evidence two of those kinds of tariffs; we designated one that the very little movement is under, as the "Ruebens tariff"?

A. Yes, sir; that is emigrants' movables, fellows moving their household goods, or fellows bring- a bag of flour into town.

3141 Cross-examination.

By Mr. MOORE:

Q. Is there not a difference in the character of tonnage during the different seasons?

A. Year in and year out it would be practically the same unless there was some exceptional condition.

Q. You say, there is no material difference or fluctuation in the character of tonage that is moved in July as compared with January?

A. Oh, no——

Q. I want to know if you say that——

A. —because in December cotton is moving and in July no cotton is moving. But I say, the conditions, between state and interstate, unless there is some exceptional condition that they are the same year in and year out. Month in and Month out I think the average volume of traffic is about the same. I think you will find it about the same, because when cotton is not moving something else is moving, such as grain.

Q. The question I ask you is, if it is a fact in your opinion, that there is no material fluctuation in the character of articles handled and hauled in July or August, and January.

A. No, sir, it would show ignorance to make a statement of that kind.

Q. You would say, then, that there are fluctuations?

A. Between July and August?

Q. In order to understand and know why the revenue yield—the yield of revenue had increased in January, we will say,

3142 over July or August, you will have to know what those fluctuations consisted of in tonnage, would you not?

A. In order to perfectly analyze the statement, as I told you before it would be necessary to know, but as a general proposition to look at a statement and you see that the factors, the tons, the miles, the rate or the revenue—those are the three factors—when you find those, you can tell whether a railroad has profited or whether it has lost.

Q. But you omit from your calculation of factors the character of the tonnage?

A. Well, the character of the tonnage makes little difference.

Q. Is it not the most important of all the elements that would be considered in determining what produced an increase of freight as between July and January?

A. As to what produced it, yes if you have that factor alone and no reason behind it, but if you knew there had been a general advance in rates and had this other, the tonnage, the miles, the average

distance, the revenue—you could very easily tell whether there had been an increase in favor of the railway or a decrease as against them, but to analyze it and say that the raise on grain had caused the increase or the lowering on stone had caused the decrease, it would be impossible for any man.

3143 Q. Let us assume that you did not know anything at all about what the rates are at the two periods and that you do not know anything about what the character of the commodities carried in the two periods is:

You are simply confronted with the fact that in January the revenue per ton per mile was larger than it was in July; someone asked you to account for that: would you not say, I cannot account for it unless I know the character of the tonnage and also the rates in those two periods?

A. No, sir, I would ask him to let me see the statement showing the number of tons and average distance.

Q. You would not care anything about the kind of tons?

A. If I had the time to analyze it and wanted to get to the bottom of it I might, if I wanted to find the reason, but if I was simply trying to see if the roads had lost or made money, I would simply ask him to let me see the total tons handled and the average distance hauled.

Q. You are trying to find out what increased the revenue per ton per mile; that is the only proposition. You do not know anything about the condition except that there is an increase in January over July:

You do know that there is a large fluctuation in the character of tonnage hauled in those two months:

Having that information, how would you undertake to
3144 account for the increase, not to say whether the road has made or lost, but to account for the increase.

A. I would ask one of two questions, either for the statement of the number of tons of each commodity handled and the average distance hauled, or I would ask if that was impossible and would require considerable work, I would then ask if there had been a general or specific increase in rates on any commodity.

Q. Suppose the rates had been wholly unchanged: suppose that in the month of July the commodities hauled were low grade, all of them, and in the month of January the commodities hauled were all high grade: what effect would that have upon the revenue per ton per mile?

A. It would result in increasing it.

Redirect examination.

Mr. HILL:

Q. After the railroads got the state enjoined from making their own rates and you found an increase of 96% in the state rates, you could make a pretty good guess where it would come in?

A. I said, the first question I would ask was for a list of the com-

modities covered and the tonnage; or, if that was hard to get, I would ask if there had been a general increase in rates and if there had I would not have much further to go to get the reason for it.

3145 CHARLES S. LUDLAM, a witness of lawful age, being duly produced, sworn and examined testified on behalf of the defendant as follows:

Direct examination.

By Mr. HILL:

Q. Please state your name, age, residence and occupation, Mr. Ludlam.

A. Charles S. Ludlam; age 43; residence New York City.

I am a certified public accountant under the laws of the States of New York, Illinois, Ohio, Pennsylvania and Missouri. I am a member of the firm of Haskins & Sells, Certified Public Accountants, whose main office is at #30 Broad Street, New York City, and who have branches in Chicago, St. Louis, Pittsburg, Cleveland, and London, England.

Q. Mr. Ludlam, please state somewhat the nature of the business of Haskins & Sells, giving a little history of the firm and its work generally.

A. The firm of Haskins & Sells was organized by Mr. C. W. Haskins and Mr. E. W. Sells in the year 1893.

Mr. Sells, for several years prior to the organization of the firm, had been the Auditor of the Colorado Midland Railroad Co.

Mr. Haskins had been the Auditor of the disbursements
3146 of the West Shore Railroad Company.

Mr. Sells and Mr. Haskins, were selected by the Government of the United States to make an investigation and reorganization of the accounts of the Treasury Department of the Government. They were brought together in this work, which continued for a period of two years, and upon its completion they organized the firm of Haskins & Sells to conduct accounting work.

My assocation with the firm began about three or four months after it was organized.

Q. You have been with the firm continuously since then?

A. Ever since.

Q. Without going into detail, state somewhat the nature of the work done by Haskins & Sells as public accountants.

A. We do auditing work for individuals, firms, and corporations. We devise and install systems of accounting, and make special examinations to determine the value and earning capacity of various properties and investigations for bankers and other financial interests.

A considerable portion of our work embraces the devising and installation of cost—accounting systems for various enterprises, principally of manufacturing companies.

3147 Q. From the various offices that you have, I infer that your firm does business in various parts of the United States and in England?

A. Yes, sir.

Q. Is that same character of service done in the various offices of your firm?

A. Yes, we have a large accounting practice throughout this country and Europe.

Q. What connection does your firm have with railroad work? Give what you may do along that line.

A. Our relations with our clients are naturally of a confidential and professional nature, but there are a great many of the railroads that we audit that publish our certificate and consequently make the fact known publicly that we are their auditors, and I would feel at liberty to give their names.

Among others, I might mention the Lehigh Valley, Louisville & Nashville, the Atlantic Coast Line, the Philadelphia & Reading, the Erie, the Mobile & Ohio and the Carolina and Northwestern. That is all that I recall at this moment, that publish our certificates.

In addition to that, we make a great many special examinations for railroads. Frequently we are called in to improve the systems of accounting in various of their departments.

Q. What is the general nature of that work that you do
3148 for the clients whose names you felt at liberty to mention, and others whose names you have not mentioned? What is the general nature of that work, and what does it require of you to do in the performance of your duty to these railroad clients?

A. Largely the verification of their financial results and the improvement of their accounting methods and systems.

Q. Does your firm do considerable work for railroads along the lines you have indicated?

A. Yes, sir.

Q. Do you keep employed forces of men who are familiar with railroad accounting and railroad work?

A. Yes, sir, we have quite a large number of men in our employ who have been railroad auditors and employed in accounting departments of railroads.

Q. I wish you would state your personal experience before you became connected with the Haskins & Sells Co., what work you have done.

A. I started with the Pullman Co. in Chicago when I was fourteen years of age, as office boy in the Secretary's office.

I remained with the Pullman Co. for 16 months, having been advanced before I left there to the position of bookkeeper of the books relating to the capital stock accounts of the Company. I might say incidentally that during the sixteen months I was with
3149 the Pullman Company, my salary was raised eleven times.

My health broke down then and I went out West, and in about two months I went to work with the Atlantic & Pacific at Albuquerque, N. M., now part of the Santa Fe System. I worked there about two and one half years.

I then went to Colorado as Assistant General Bookkeeper in the

Auditor's office of the Colorado Midland, a few months later becoming General Bookkeeper in the Treasurer's office.

I left that position to accept a position with Mr. J. J. Hagerman, capitalist in Colorado Springs, and was with him in Colorado Springs for several years; during that period being the Auditor and Accounting Officer of some seventeen—as I recall it, railroads, land, water and mining companies.

I then went down to New Mexico as Auditor of the Pecos Valley Railroad Co., and the Pecos River Railroad Co., and to represent Mr. Hagerman in various other interests which he had in the Pecos Valley. He had invested a very large amount of money in that part of the country.

I remained there about two years, as I recall it, and then went to New York at the request of Mr. Sells, whom I had known in Colorado Springs, to become associated with Mr. Sells.

Q. You have been either an employee or a member of that firm ever since, have you?

3150 A. Yes, sir.

Q. Were you a member of the firm from the beginning, or an employee?

A. No, sir, I went to them to take a position as accountant and I became a member of the firm in about 1900.

Q. What personal experience have you had in the way of investigating railroad accounts since you have been connected with Haskins & Sells? I mean, whether you have personally given study, thought and investigation to these railroad accounting systems, or have you left it to others.

A. I have had direct personal charge of many of our most important railroad engagements, and I have kept in touch, in a supervisory capacity, with practically all of our railroad engagements.

Q. I believe you are practically the head of the railroad accounting department of your firm, are you not?

A. I don't know as I want to say that. Mr. Sells——

Q. I mean, that work falls to you.

A. Mr. Sells is an ex-railroad auditor and he gives those matters considerable attention. Mr. Dunn, one of our partners, is also an ex-railroad auditor.

Q. But your work is largely along the line of railroad auditing and investigation?

A. Yes, sir, a considerable part of it is. I have given a great deal of attention to railroad work.

3151 Q. Since you have had actual experience, have you kept up in that way with the systems of railroad accounting and book-keeping, the division of expenses and the bases of dividing those expenses, as practiced by the railroads of the United States and other countries?

A. I think so, yes, sir.

Q. I wish you would explain, from an accounting standpoint, the method of installing a cost accounting system: if you were called upon by a railroad, or by an industrial or manufacturing plant or business house, to put in a cost accounting system—devise

it and install it—what method would you pursue in performing those duties for your clients?

A. My first attention would be directed to a study of the operating conditions; the product of the factory and the condition under which that product was produced. After I had studied the situation carefully I would proceed then to design a system that would determine accurately, or as nearly accurately as possible—of course, in all accounting systems there are certain items that you have to apportion—to determine on that basis the actual cost of the different products, or the various kinds of products that the factory might produce. That would embrace, first, the necessary accounting forms including labor reports, material requisitions, and all the different elements that would enter into the question of cost.

3152 Q. You would learn this from actual investigation of the particular business to which your attention was invited?

A. Yes, sir.

Q. Some questions have been asked from other witness, indicating that an accountant would have to be an operating man in a particular business, before he could install a cost accounting system for that particular business:

What is your view about that? What has your experience taught you in regard to that matter?

A. My judgment is that the operating man, as a general proposition, is the last man who is able to figure out his own cost; that is done by the accounting department and by the various cost departments of the different manufacturing concerns.

Naturally, in installing a system of cost, we would confer with the operating man and familiarize ourselves with the operating transactions sufficiently to be able to devise forms and install systems that would take care of all the operating transactions, but we would never depend upon the operating man's opinion of what it cost him.

Q. If an operating man installed the system, the accountants would go out of business?

A. I think also the operating men would go out of business.

There is nothing that is more generally recognized, I think, and coming to be recognized more and more every day, than
3153 the absolute importance of separating the operating and the accounting departments, particularly in railroads.

I can remember back in my day when the General Manager would instruct the Auditor how to charge certain expenses, but the financial interests, in so far as they control railroad accounting and railroad investments, have learned that it is imperative that the accounting officer should act exclusively on his own responsibility and be accountable only to the Board of Directors of the corporation, if you want to know the actual facts as to the result of operating the property.

Any operating man could make a very fine showing for his property if he was allowed to direct how the different items should be charged.

Q. Explain why that is, particularly in railroad operation.

A. In order to ascertain the true results, the further you can separate the ascertaining of those results from the man who would be interested in the results shown, the more accurate your results will be, naturally.

Q. Then your object is to get actual conditions and apply your accounting knowledge to those conditions to properly apportion your expense?

A. Yes, sir.

Q. You had some connection, did you not, Mr. Ludlam,
3154 with the Missouri rate litigation?

A. Yes, sir.

Q. Just what was your connection with that and how deeply did you go into that case?

A. Our firm was employed by the State of Missouri, by Governor Hadley, to determine as far as possible the cost of conducting the state business within the state of Missouri on certain of the railroads that enjoined certain rates that were prescribed by the Legislature of the State of Missouri. We were engaged on that work for nearly three years—I think two and one half years, or three years. We went into it, I think, very exhaustively.

Q. Just what was the general character of the work you did for the State of Missouri in those cases?

A. Very similar to the work we have done for the State of Arkansas. We made a study of the earnings and expenses of the road, and the division which was made between the state and interstate expenses.

Q. Have you gone about this just as you would go about the installation of a cost accounting system for an industrial concern, as near as the conditions would permit?

A. As near as the conditions would permit. Of course you cannot obtain the same results from a system that has been in use, that you might be able to obtain from the system that you your-
3155 self installed. In other words, you cannot determine certain elements of cost in studying past records that you might be able to provide for in designing future records.

Q. It would be more nearly analagous if I were to put my question that, if you were called upon by an industrial concern to examine their then existing accounting system and to improve it or change it, that would be more nearly the point of view in which you have gone into these cases, would it not?

A. Yes, sir, that would express it better.

Q. I do not believe I asked you how much personal connection you had with the Missouri case.

A. I kept in touch with the work and took personal charge of it for a considerable portion of the time. During the course of our examination, including the time in Court, I think I gave probably four or five months of my personal time to that engagement.

Q. Who had the more direct personal charge of it?

A. Mr. Taliaferro.

Q. Have you in that case and in this case made a study of the

accounting systems presented by the railroads and presented by the states, respectively, in these cases?

A. Yes, sir.

Q. I want to call your attention, in the first place, to the accounting system of dividing expense between state and interstate, offered by the railroad company, known as the revenue basis, with which you are doubtless very familiar:

3156 Mr. Frank Nay, Comptroller of the Rock Island Road, a witness on behalf of the plaintiff, after giving his reasons that the revenue basis was preferable to a ton mile basis, as he saw it, said (page 301, volume 2 printed record): "after making the basic approximation of the operating expenses for intrastate freight or passenger traffic, the figures thus arrived at may be increased in the proper proportion to represent the excess of the cost of transporting intrastate traffic over the cost of transporting interstate traffic."

And Mr. McPherson, along the same line, after defining the revenue basis, said (pages 350 and 351, volume 1): "To this basis as a fundamental one, should be added such additional cost as may attach to the handling of intrastate business, over that of the interstate."

I will ask you to explain the force, if there is force, to the suggestions which I have read to you from these two witnesses of the plaintiff in explanation of the revenue theory as they advocate it.

A. I think that the revenue theory as used by the railroads in this case, and as used by the railways in the Missouri case, is unsound, illogical and contrary to all accounting principles, and I think those conclusions are testified to by the remark of Mr. Nay and Mr. McPherson which you have read to me; because, if the revenue theory was the basis—an accounting basis I might say—

3157 for determining the cost, then there certainly would be no reason for adding anything to the cost after you had thus ascertained it.

Q. Why is that, Mr. Ludlam?

A. Because, after you have determined a cost, that is the cost, and when you attempt to determine your cost on your revenue basis, and then say that you must add, or that you must deduct, or that you must do anything else to that cost so obtained, you show you have not the cost to start with.

I read that whole treatise of Mr. Nay's and I must say that it was a surprise to me that a man of Mr. Nay's ability would build up so elaborate an argument covering several pages, and then, as I see it, absolutely dispose of it in the last paragraph of his essay.

Q. That is the paragraph I read to you?

A. Yes. After having explained very elaborately how he would determine the cost, he goes on to say that having thus determined your cost, your cost is of no use unless you go to work and multiply it by two, three or four, or whatever you think fit.

Q. As I remember his testimony, he had prior to that explained that the revenue was proper, or it was the best measure, because it reflected the cost of the service; it reflected the cost of the service—

that is between state and interstate—how could you add something to it then if that relation already existed?

3158 A. That is exactly the point I make. That must necessarily be illogical in its basis, if after you have reached that basis you have got to add something and that addition must depend, not upon any established fact, but upon the opinion of different people, and you cannot find any two people—I make this statement as evidenced by the testimony taken in this case—you can hardly find any two people who agree as to what amount should be added, and Mr. Nay leaves that open.

Q. I believe, in the Missouri case, there was greater variation as to that added amount than there was in this case?

A. Yes, sir. As I recall it, Mr. Sturgis started out with the proposition that you should add from seven to fifteen times. But I think after he was requested to figure out how much he would have to raise the state rates in order to make a profit on the state business if it cost fifteen times as much in proportion to the revenue to do state business as interstate, his views were modified. Or, at least, he did not advance the "fifteen times" in the latter part of his testimony, as I recall it.

Q. Passing from the question of the extra costs, and going back to the primary proposition of ascertaining your cost by the revenue derived from state and interstate traffic: how does that compare with the general accounting that prevails in business concerns generally and with railroads themselves in handling their own force?

3159 A. It is absolutely contrary to all accounting principles and practices. I have never heard the revenue theory advanced for a basis of determining the expense, except in the Missouri case and in the State of Arkansas case.

Q. In what way does it run counter to accepted accounting principles?

A. I would say both in the manufacturing, wholesaling and retailing and railroad business, on the ground that the ratio of profit is not the same on all transactions and necessarily cannot be.

Q. When you go to ascertain the value of the property, what significance do you attach to the gross earnings of the property?

A. Given the gross earnings by themselves they would mean nothing. I might illustrate that by saying that if an investor was thinking of buying a factory it would mean nothing at all to him to know that the gross earnings of that factory were a million dollars a year. He would have to know what the expenses and net earnings were. He would probably base his ideas of value upon the net earning capacity of the property.

If a man was going to buy a sugar factory, we will say, and an automobile factory, and he knew that the gross earnings of each was one million dollars, and that the combined operating expenses of the two, we will say, 75 percent of the earnings, it would never

3160 occur to him to buy the sugar factory or the automobile plant on the basis of the expenses being the same as the ratio of expenses of the two together. He would find out as positively and definitely as it could be ascertained on the actual facts, what the

actual expenses and the gross earnings of the particular factory he was thinking of buying were.

You asked me about the relation of gross earnings. A plant might be earning a million dollars gross, and still be losing money; whereas another plant might be earning a million dollars and earning a large percent of profit. Consequently, unless you considered the expense and the resulting net earnings, the gross earnings mean nothing in themselves.

Q. Yet the railroads have used gross earnings in this case to determine the relative profit of state and interstate business?

A. Yes, and I think it is illogical, unsound and contrary to all accounting principles, and I think Mr. Nay, in his last paragraph illustrates that more forcibly than anything I could say. It looks to me as though he had built up in several pages of essay an elaborate—you might call it a snow-man—only to knock it down in the last three or four lines; because he proceeds to say after you have thus determined your costs, they are not your costs, but you must find out what they are.

3161 Q. I believe he also stated, if I remember it correctly, that unless there was a proper relation between the state and interstate rates—and by relation he meant relation of cost one to the other—that the revenue theory of dividing expenses would have no value:

I think that is the substance of his statement on that.

Assuming that to be correct, what are you going to do with the extra cost that you have to put on it after you get it bottomed on the theory that there is a cost relation between the two to start with?

A. You will have to ask somebody besides an accountant, I think, to find that out.

Q. Have you given study and investigation to the subject of whether there is a relation, cost relation I mean, between the revenue derived from state traffic and the revenue derived from interstate traffic?

A. Yes, sir.

Q. What have you found in that regard?

A. As a result of my study, I am of the opinion that there is no relation; not only between state and interstate, but between the different rates in interstate and state.

Q. What do you base that in, Mr. Ludlam?

A. The examination I have made of the rates in the State of Missouri and the State of Arkansas, in a general way, and also

3162 the exhibits which have been filed in this case.

Q. Do you understand from your investigations, the system upon which interstate rates are built?

A. In the sense that they are made largely on competitive and commercial conditions: I would not say as to any individual rate.

Q. I am not speaking of individual rates.

A. I know in a general sense, for instance, that rates from St. Louis to New Orleans are cheaper than from St. Louis to Little Rock, which illustrates the point I am trying to make.

Q. Are you also familiar with the varying distances on which

large movements are carried on the same rate? You have looked into those propositions, I presume.

A. Yes, sir, in a general sense. Divisions that are made on tap line connections, things of that kind.

Q. Mr. McPherson says in his testimony (Volume 1, page 351): "My reasons for this opinion are that the revenues of the railway are derived from different sources; the transportation of passengers and freight, and from miscellaneous services rendered; rentals, etc.

A division of these earnings can be exactly ascertained and, naturally, they reflect the value to the railway of each class of the service it performs."

Then he follows:

3163 "The passenger and freight revenue consist of both intrastate and interstate traffic; the revenue from each of which can also be exactly ascertained. Moreover, the "revenue basis" is reflective of the efforts of the traffic men who make the rates, to consider, in a measure, the value and character of commodities, and the risk and distance attached to their transportation. This is apparent in the classification of commodities into classes and the different rates established for their carriage.

The revenue derived represents the well-established and generally recognized elements considered in fixing rates of the railway for the service it performs."

Then he takes up some illustrations. Now, I ask you to state what is your view of that analysis of the situation by Mr. McPherson.

A. Assuming that Mr. McPherson refers to the gross earnings, I disagree with him, because the value to the railroad of the business which it does is the net earnings which it derives therefrom, and not the gross earnings which it receives therefor.

Q. That is true whether you take it as referring to passenger and freight; state or interstate; miscellaneous, or what not?

A. Yes, sir. Naturally the value of the business is what it will earn, not what it will earn gross, but what it will earn net. It would not profit a railroad to take a million dollars' worth of business if it cost them a million and a half dollars to execute it.

3164 Q. I call your attention also to the fact that in this case the railroads divide their property which is in the State of Arkansas, between state traffic and interstate traffic, in proportion to the gross earnings of each, after setting aside the miscellaneous: I will ask you what your view is of that division?

A. I think that division is wrong, on account of the fact that the gross earnings, which fluctuate with every change in rate, are not, in my opinion, a fair basis to divide the property. I think you have a more equitable division if you will apportion your property on the basis of the cost.

In my judgment, the cost would represent more correctly the use made of the property by the different classes of business.

Q. Suppose there was an increase in state rates, without any exact proportional increase in the interstate rates:

What effect would that have on a division of the property or a division of the expenses?

A. The amount which the state rates were increased in excess of the interstate rates, would on the basis of apportioning property on the gross earnings, naturally increase the property assignable to the state business.

Q. Have you seen the exhibits out here by which it is shown that there was an increase of nine and a fraction per cent of interstate rates, and an increase of ninety-six and a fraction per cent on state rates, put in by Mr. Kimbell?

3165 A. Yes, sir; that increase appearing during the month of January.

Q. Yes. These figures as I understand it, represent the increase of tons per mile.

That is necessary, is it not, a result of fluctuation in gross revenue, that every time there is a change of rate, either state or interstate, as the case may be, producing a change of revenue, that there will be a change in the amount of property apportioned to the respective class and a change in the amount of expense apportioned to the respective class, when in fact there is no change?

A. Yes, sir. Apportioning the property, expenses or anything else on the revenue basis would naturally mean that if you carried a piano one day at one price, over a certain part of the road, and a month afterwards you carried another piano of the same kind, over the same piece of property and charged twice as much for carrying it; that your cost was twice as much and the proportional use of your property was twice as much in the latter case as in the former.

Q. If that piano happened to move in state business and the rate was double, it would to that extent increase the state property and state expenses?

A. Yes, sir, when figured on the gross revenue basis.

Q. If it happened to move across a state line and the rate was doubled or trebled, it would to that extent decrease the amount

3166 of interstate property and interstate expenses, and as a matter of fact there is no increase or decrease, as the case may be, in either, by reason of the change of the rate on that piano?

A. There would be no change in the cost or use of the property on account of the rate changing.

Q. Suppose they increased the piano rate 9 per cent in interstate traffic and 96 per cent in state traffic: where would you be then?

A. I think you would be just where you started, on a false premise, on the revenue basis.

Q. Mr. McPherson says at page 351:

"The revenue, therefore, expresses value, character, risk and distance, rather than quantity; and likewise considers to no little extent, the question of cost, as it is obvious that it costs more to transport some commodities, and commodities in small quantities, than it does other commodities, and commodities in larger quantities.

A consideration, therefore, of cost on the mere basis of quantity, would mean the blending of all classes of freight; a reduction of all classes of freight to a common unit, and the assumption that the cost of their transportation was equal. Also, that the length of haul and other conditions affecting the cost were equal or the same.

For these reasons, in my opinion, the revenue basis is a proper basis on which to apportion the cost, or to divide the cost of operation as between intrastate and interstate traffic."

I wish you would state wherein you think that is based on a wrong premise, if you do think so?

A. He says, if I understand your reading correctly that they consider——

Q. Look over it if you did not catch it.

3167 A. (After examining statement:) —many other elements rather than quantity. I never heard of a railroad rate that did not consider quantity.

I disagree with Mr. McPherson in this, because I think railroad rates do consider quantity equally with value, risk and distance, and I disagree with him in his premise that the revenue—by "revenue" meaning gross earnings—considers to no little extent the question of cost.

He goes on and it seems to me he contradicts himself, because he says:

"It is obvious that it costs more to transport some commodities, and commodities in small quantities, than it does other commodities, and commodities in larger quantities."

I am unable to understand what he means when he says that they don't consider quantity, and then says that it costs more to transport commodities in small quantities and others in larger quantities.

Q. Does the revenue derived from the rates represent the cost of the service, as you find it in your investigations in your railroad experience?

A. No, sir.

Q. Is there any system to your knowledge, by which a rate maker can ascertain the cost of service?

A. I don't think the rate maker, as a rule, has any specific data as to the cost of the service.

He knows in a general way how much it costs per ton per

3168 mile, to move freight on his railroad—as a general rule he does not have that information by divisions—and he knows in a general way—to use the illustration that has been referred to here frequently, that a carload of baskets won't weigh as much as a car of pig lead, and therefore has some idea of equalizing, that they should charge more per pound for a carload of baskets than they should for a carload of pig lead.

Q. Well, there is a vast difference of expense upon one division of the road than another, I should take it.

A. Yes, sir.

Q. We had evidence here this morning that the difference in the ratings of locomotives on the White River branch of the Iron Mountain and locomotives that were run on the main line of the Iron Mountain:

Q. What effect would that have on the cost of the service?

A. There would be a great difference in the cost of service on different divisions of the line, according to the grades and curvatures.

Q. And the ability of the engine to handle larger or smaller trains, I suppose?

A. Yes, sir.

Q. Suppose there was a lime kiln on the White River branch on the Iron Mountain road and they wanted a lime rate: that lime would move on every other line of the road:

How would the rate man know the cost of the service when
3169 he started in to fix that rate?

A. I have never seen any statistics of any railroad company that would show the specific cost by divisions, of handling lime or any other specific commodity.

Q. Have you seen the statistics of any of the railroads in operation in this southwestern country, that show the cost per ton per mile in the handling of the various commodities?

A. No, sir.

Q. Has any system been worked up so that a rate man can have the cost per ton per mile on coal, lumber or merchandise, as the case may be.

A. No, sir, not that I know of.

Q. Have you gone pretty fully into railroad accounts in this country and investigated that, so if there were such systems you would have some familiarity with them?

A. Yes, sir.

Q. Then when these gentlemen speak about the cost of service being reflected in the revenue, I would like to know if you can explain to me what basis they had in mind when they made these statements, if you are able to do it?

A. I think their basis is theories, the same as the revenue basis, and not facts.

Q. I presume the rate maker has before him, or should have before him the cost per ton per mile of handling freight upon
3170 his entire road, for the preceding year:

What value would that be to him in making specific rates?

A. In my judgment, I should say only in a general way. It would give him an idea, roughly, of the average cost of moving freight on his line, and in a general sense, a figure below which he would try not to go.

Q. That is about as far as they have gone in the statistical work of the railroads in the southwest, is it not?

A. As far as I know, yes, sir.

Q. Mr. Ludlam, have you spent any time and investigation in trying to work out any division between state and interstate, which was nearer the actual facts than the revenue theory?

A. Yes, sir. My firm has prepared a statement in this case, that we think reflects pretty closely the cost of the two classes of business in the state of Arkansas.

Q. Have you devised and assisted in the preparation of that method of accounting?

A. Yes, sir.

Q. I believe you begin this division by first taking a division between freight and passenger?

A. We accept the companies' figures on the freight and passenger. We have not gone back of the statement submitted by them in this case.

Q. Upon what basis did they divide that?

A. I understand they divide that upon the revenue train mileage basis.

3171 Q. You began, then, where they left off?

A. Yes, sir.

Q. Taking up the freight side of the matter, take the first account, "Maintenance of Way and Structures":

I wish you would state, without going into detail, the basis used and why you adopted that basis?

A. I might say that to start with we have attempted to allocate, as far as possible, the freight expenses to the local and through trains. It having been testified to in this case and it being a well known fact that there is a considerable difference between the cost of operating local and through trains, we have attempted to allocate the expenses, as I say.

Q. That was the beginning point of your work?

A. Yes, sir.

Q. Owing to the difference in the cost of local and through trains, in trying to ascertain what that was?

A. Yes, sir.

Q. Is there a difference between the cost, state and interstate, strictly speaking, or is it a difference that grows out of the use of one kind of service more than the other kind of service?

A. Out of the use of one kind of service more than another kind of service, and also in my opinion, on account of the increased use of station facilities in the state service.

3172 Q. The mere fact that the traffic passed a state line has no effect upon it?

A. No, sir.

Q. Have your investigations led you to form an opinion as to whether there is a difference in the character of the traffic carried by the trains in Arkansas, as between state and interstate, carried by the trains through Arkansas or in this southwest country?

A. No, sir, we find no difference in the general character of freight carried by the two classes of trains.

Q. I believe some of the witnesses testified they moved inseparably is that your view of it?

A Yes, sir.

Q. Take up that first division: you are seeking to work out the cost between local and through trains:

How would you take care of the first item of expense, "Maintenance of Way and structures"?

A. The maintenance of way and structures "expense" freight have been divided between local and through train service on the basis of the total engine and car miles of each class during the month of October, 1908.

Q. 1907?

A. 1907 in the Iron Mountain and 1908 in the Cotton Belt, that month being considered representative of the business for the six months ending December 31, 1907.

Q. Why did you use a car mile as the basis for that division, or engine mile, as the case may be?

3173 A. We considered that the engine and car miles represent more correctly than any other ascertainable quantity, the use which was made of the track; the use which was made of the property that these expenses represent the cost of maintaining.

Q. There has been evidence in this case to the effect that a large part of that item of expense is due to the elements, wind and water; matters with which the actual operation of the road is not concerned—the actual running of trains is not concerned in the operation of the road, I mean.

What do you say to the justice of dividing those expenses that are not caused by the running of trains, on a car mile basis?

A. I think it is entirely equitable and proper. The question of whether the actual running of trains wears the tracks out, or whether the elements wear the tracks out, and the other property that is put there for the operation of trains, is immaterial. You have to charge the expense which is incurred for the use for which it is incurred. They maintain the track and maintain the property in order that trains may be operated over the property, not on account of the weather or elements wearing the property out. They don't repair it merely to replace the wear and tear of time or the elements, but they do it in order that they may operate trains.

3174 Q. That road-bed is not there for ornamental purposes?

A. No, sir. It is exactly the same as in a case, for instance of a chair factory: when you would have to repair the roof on a chair factory it is an expense incurred which you would apportion to the cost of the chairs manufactured in that building, although, as a matter of fact, the actual making of a chair in that building has nothing to do with the wearing out of the roof. But it is a part of the cost of maintaining the property and you charge that cost to the use which is made of the property. That is an ordinary accounting principle.

Q. Is that a principle that is recognized by accountants generally and railroad accountants in the working out of accounting systems and properly distributing costs?

A. Yes, sir.

Q. I see you have added in this paper, fifty percent to the engine mileage of local trains for station switching, and have assumed that each engine mile was equivalent to two and one half car miles:

What is the reason for that, Mr. Ludlam?

A. Well, the local train does a large amount of switching at stations and there is some element of increased cost in connection with that work. We felt that fifty percent was probably the maximum amount that would possibly be claimed for that service, and therefore allowed fifty percent to be added to the engine mileage of local trains.

3175 Q. That was an item of extra expense which should be borne by the local train and you were trying to take care of in this, all items of extra cost of one train over the other?

A. Yes, sir.

Q. The next item I see added—some of the witnesses called these "arbitraries"—was counting a locomotive equivalent to two and one half car miles:

Q. How did you reach that conclusion, and why did you reach it?

A. That is a basis frequently used by railroads, based somewhat because the average locomotive has twenty wheels and a freight car has eight wheels. It is usually roughly figured about two and one half car miles to an engine mile, on a wheelage basis.

Q. That is another effort to get as near the actual value as you might put it of the property, between the engine and the car?

A. Yes, sir, it is an attempt to apportion as nearly equitable as possible these expenses.

Q. The next item is "Maintenance of Equipment":

The first sub-head is (*a*) Locomotives:

I wish you would state generally how you have apportioned those expenses and why you have done so.

A. The expense of maintenance of locomotives, freight, has been divided between yard, and local and through road locomo-
3176 tives, on the basis of the locomotive mileage of each class during the month of October, 1907, in the case of the Iron Mountain, and October, 1908, in the case of the Southwestern.

We have added to the mileage of the yard locomotive fifty percent to provide for the possible extra maintenance due to yard service, and have added fifty percent to the mileage of the road locomotive in local service to provide for the possible extra switching mileage, and again, we have added fifty percent to the switching mileage of the local train engines thus ascertained, to provide for the possible extra maintenance due to switching services, making a total of seventy five percent added to the local engine mileage.

Q. Explain just why that is done, Mr. Ludlam.

A. Well, we thought that there was an extra maintenance expense in connection with yard locomotives, as compared with road locomotives, on account of the switching they did, and we thought that fifty percent was a maximum for any such expense.

In the case of the locomotives in local service, we also added fifty percent to the mileage to provide for the switching which they did at local stations, and then added fifty percent again to that figure to provide for the possible extra maintenance, as we felt there was some extra cost incurred by those locomotives in connection
3177 with the switching that they did.

Q. You think these items cover that extra cost?

A. I am inclined to think they are excessive.

Q. That they more than cover it?

A. Yes, sir.

Q. Now, the next item under that expense of "Maintenance and Yard Locomotives" is divided between local and through service on the basis of the number of cars of each class of service handled by

yard engines during the given month, and the total number of cars handled at terminals:

What do you say to that method of apportioning the expense? What is your reason for using that basis?

A. We think that the number of cars which the locomotives handle is the most correct basis possible for apportioning the expenses.

Q. Should there be any difference in the character of cars that are handled by locomotives in that item of expense?

A. No, sir, not in our judgment.

Q. Take the next item of "Freight Cars":

A. We think that the cars in and out of terminals is the most equitable method to apportion the expenses of yard engines.

Q. The next one I call your attention to, Mr. Ludlam, is (*b*).

A. Freight cars?

3178 Q. Yes, what is the principle upon which that apportionment is made?

A. Principally on the car mileage basis, but before applying the car mileage basis we have taken into consideration the element of repairs due to the stopping and starting of trains at way stations and the repairs due to extra terminal handling of cars in the local service.

We have accepted the figures given on this expense by Mr. A. M. Wellington.

Q. I believe it is already in evidence that that is considered a standard work on this subject?

A. I so understand.

Q. Your effort there is to take care of these elements of extra cost chargeable to freight cars in the local service, according to the best standard you can find?

A. Yes, sir.

Q. What do you say to the use of the car mile as a division of that expense, primarily?

A. After making the allowances stated, I think the division of the balance of the expense on a car mileage basis is equitable and proper, and I think the fact that expenses of this nature apportioned to Arkansas by the railroad company *is* made on a car mileage basis is a verification of that basis.

Q. That is a fact, I believe, in testimony already by Mr. Johnson?

3179 A. I so understand.

Q. The railroads having made the apportionment of expenses included in their exhibits, on that basis, you could not very well take any other, could you?

A. Well, I would not say that. If we thought there was any more equitable way, we would have taken it, but we thought that was the most equitable and therefore we took it.

Q. Here is an allowance for a stop every five miles on the local trains and twenty miles on the through trains, as affecting the expense of repairing cars:

I wish you would state the object of making that allowance.

A. The local train does stop oftener than the through train, and there is an element of expense that is due to the stopping and starting of freight trains.

It is, therefore, assumed that the local train makes a stop every five miles and the through train every twenty miles. I think it is rather overcharging the local train.

Q. You had some information on that subject, did you, that made you believe that you were putting the maximum on that?

A. We believe we are charging the local train the maximum on that account.

Q. I wish you would explain item (c) "Supervision and General":

3180 Why has that system been adopted? It runs all through this exhibit, not only as to this item but as to general expenses.

A. It is a well recognized accounting principle that you arrive at the most correct results that are obtainable, by apportioning the indirect expenses which cannot be specifically allocated in the ratio of the direct expenses which can be specifically allocated.

That is to say, if your direct expenses are one hundred dollars, and your indirect expenses ten dollars, or ten percent thereof, that you would apportion the ten percent on the basis on which you were specifically able to locate the elements composing the one hundred dollar item.

Q. Is that recognized in all accounting systems, Mr. Ludlam?

A. Yes, sir, that is the generally adopted method of distributing indirect expenses.

Q. I wish you would define just what you mean by "indirect expenses."

A. Expenses that cannot be specifically charged to—in the railroad business—to the different classes of service; or, in the manufacturing business, to the specific article of manufacture, such as salaries of superintendents, stationery and printing, heating and lighting, and things of that nature. When I say heating and lighting, I am referring to the manufacturing business.

3181 Q. What would you class in the railroad business as "supervision and general"? I don't mean each detail of it, but just give us a general description of it.

A. The supervision of the maintenance of equipment and the general expense in connection therewith which could not be specifically located as applicable to the various classes of cars.

Q. You take this under this general sub-head formulated by the Interstate Commerce Commission, of "maintenance of equipment" and take all items that you regard as belonging to the class called "supervision and general" and apportion those due to that particular service on a basis of a direct charge? Is that the plan?

A. Yes, sir.

Q. When you take the road as a whole—to save repetition I will take up the next sub-division—I believe in this exhibit it is "general expenses" the fifth sub-division in this exhibit, seems to have the same principle as a method of dividing——

A. Yes, it is impossible to say how much of the President's salary attaches to a local train or to a through train.

Q. Or to state or interstate?

A. Or to state or interstate. The same is true of the salary of the clerks in the auditor's office or any of the items entering into "general expenses."

Q. How does that result as a general accounting proposi-
3182 tion, taking the salary of the President, how is that distributed under this system?

A. Having specifically apportioned all of the expenses that you can, then you apportion the indirect expenses which would include the salary of the President, on the basis of the direct expense.

Q. And that is the system which you have followed throughout here, in all your general expenses and all overhead expenses, I believe?

A. Yes, sir, in all of the general or overhead or indirect expenses.

Q. The third sub-division in this exhibit is the "Traffic expenses": I wish you would state what basis you took there and why you took it?

A. We accepted the company's basis there and apportioned traffic expenses on the revenue or gross earnings.

Q. What do you say about that being a proper basis?

A. I don't think that is a proper basis and I think it overcharges the state business.

Q. Is there any way that you can find a proper basis of that and the way the railroad accounts are now kept; or is there any basis that would be better than that?

A. Well, I think almost any basis would be better than the revenue basis.

Personally I am inclined to favor the ton mile basis because
3183 the larger part of those expenses *are* incurred in obtaining competitive or long haul business, and your interstate freight on the average moves so much further than your state business that I think if you apportion that on a straight ton mile basis it would not vary very much from the actual fact.

Q. It would be a more favorable basis for the state to use in this case than the revenue, would it not?

A. Yes, sir.

Q. But even on that basis, Mr. Ludlam, does that reach the proper apportionment of business between state and interstate?

A. No, sir, not in my judgment, because that would be charging proportionately each ton mile of state freight with the same amount of those expenses that you would apportion each ton mile of interstate freight, and I am of the opinion that a larger proportion of the expenses should attach to each ton mile of interstate freight, to the ton mile, than to any ton mile of state freight.

Q. I do not suppose we need to dwell on that very much as our friends on the other side——

The next item is "Transportation expenses": The first sub-heading under that is "Station expenses":

I wish you would explain the basis used there and why that basis was used?

A. We have divided the station expenses between the state and interstate business on the basis of the number of tons of
3184 each class of traffic, assuming, however, that each state ton was handled twice and that each interstate ton was handled once.

Station expenses apply to the handling of the freight at the stations very largely, and we thought that it was fair to apportion those expenses on the basis of the tons handled, rather than on any other basis.

In making that division we assumed that each ton of state freight was handled twice, because naturally there would be an originating and a terminating terminal on each ton of state freight, and we assumed that each ton of interstate freight was handled once.

Some of the interstate freight is handled twice in the state—when I say handled twice in the state, I mean so far as the apportionment of expenses go—notably the interstate freight into and out of Memphis and Ft. Smith.

It is also shown in the testimony given in this case that there is a considerable handling of cotton, grain and lumber, interstate commodities of that nature, and we thought that on the whole it would be a fair average to assume the interstate was handled once, that each ton of interstate was handled once and each ton of state freight was handled twice.

Q. Is there not interstate less than carload that has more than one handling in the state?

A. Yes; the interstate less than carload, in my judgment, would be handled at least twice and in many cases four and five
3185 times in the state.

Q. It seems that you and Mr. McPherson are somewhat in accord on the use of tons for this purpose. I will read you his testimony from page 325:

"A third measure of which the railway company keeps a record is 'tons'. But this measure is useful only for minor services. Unless tons are combined with some other factors they do not represent transportation. The minor uses for which tons are employed may be the quantity handled by the men employed, and for some other purposes of statistics generally interesting to the railway company."

Is this such a use of it as he indicates there that the railroads make of it?

A. Yes, sir.

Q. The next item under "transportation expenses" is "yard and terminal expenses":

They are divided between local and through on the basis of the number of cars handled at terminals:

I wish you would explain that method of division of expense at terminals and why you used the method?

A. Well, because we thought the cars handled—the terminal is

the best basis of apportioning the yard and terminal expenses, the yard and terminal expenses being incurred for that purpose.

Q. That is another adaptation of the expense according to the use, is it not?

A. Yes, sir.

Q. The next sub-head is "Engine house expenses":

3186 You make an assumption that the local engines require 12% more engine house service per engine mile than the through engines, and that is based on the average engine run in the two classes of service. Would that take care of the extra expense?

A. We think so, yes, sir.

Q. The next sub-head is "other train expenses":

Is that again the proposition of the indirect?

A. No, sir, that is divided between local and through service in proportion to the train miles of each class of service during the month in question.

Q. Would that be a proper division?

A. In my judgment it would.

such movement: that is a summary of that, is it not?

A. Based on the claims actually paid during the month of October.

Q. The "total operating expenses" are divided between local and through train service, and intrastate and interstate business, and the costs are intended to include everything relating to the direct cost of the movement of freight trains with all expenses incident to such movement: that is a summary of that, is it not?

A. Yes, sir.

3187 Mr. HILL:

Q. Mr. Ludlam, I believe we got down to the 7th subdivision of this exhibit?

A. Yes, sir.

Q. I wish you would please explain that.

A. The 7th subdivision is an explanation of the method of dividing the train costs; that is, of apportioning the expense of the local freight trains and the expense of the through freight trains, after the same have been determined, as heretofore explained.

Q. Why is that the basis?

A. That basis of division is made on the business done by the two trains, as determined by the statistics, for the month of October, 1907.

That is to say, we found that 39.10 per cent of all the state tonnage miles and 8.70 per cent of all the interstate ton miles of freight were handled on the local train.

Q. Which exhibit have you?

A. The Iron Mountain. And that 60.90 per cent of all the state business and 91.30 per cent of all the interstate ton miles were handled on the through trains.

We assumed that the same relative conditions would exist during

the six months ended December 31, 1907, and apportioned
3188 the expense of the local trains and of the through trains on that basis. That is to say, the expense of the two classes of trains as determined, was distributed over the business which the examination showed that the two trains did.

Q. Having ascertained the relative expense of the two trains, how did you reach the intrastate and interstate division?

A. On the basis of the intrastate and interstate business done by the two classes of trains.

Q. Taking the actual ton miles of each?

A. Taking the actual ton miles of each as shown by the October statistics.

Q. In closing that freight side of the case, I see that you take the miscellaneous revenue; taxes, rentals and value of the property, and divide them on the straight revenue basis:

Why do you do that, Mr. Ludlam?

A. We accepted the railroad apportionment of those items, not having any specific information or data on which to apportion them.

Q. The result of that is that you have taken their apportionment to start with and worked out and analyzed the details of it?

A. Yes, sir.

Q. And brought the results as shown?

A. Yes, sir.

3189 Q. I wish you would take up the passenger side of the proposition and explain your method of proceeding under that: how did you proceed to work out as between state and interstate, on the passenger side of the proposition?

A. We divided the passenger expenses between the coach and the Pullman service, and the intrastate and interstate, mail and express business, practically on a car mileage basis. The mileage used in that was the month of October, 1907.

The passenger train mileage fluctuates very little from month to month.

We included in the car mileage the mileage of baggage, dining and parlor cars, and we show in this exhibit the percentage which the car miles of each class of the different kind- of cars bore to the total car mileage of the passenger cars.

Q. That is coach, Pullman, mail and express, are separated?

A. Yes, sir.

Q. And the cost of each ascertained on the basis shown?

A. Yes, sir.

Q. You followed the same general plan, I believe, as you did in the freight, as far as it was applicable?

A. As far as we considered it applicable to the passenger business.

Q. I will call your attention to the sixth sub-division
3190 "total operating expenses":

I wish you would explain briefly the meaning of that statement.

A. The total passenger operating expenses have been apportioned, as we explain in the exhibit, between coach and Pullman, intrastate and interstate, mail and express business. Such items as were not

chargeable to the cost of the train service we apportioned direct to the state business and the interstate business.

The expenses applicable to the mail and express business were assigned to those two classes of business.

Q. What did you do with the Pullmans?

A. In what way?

Q. Explain how you divided them between interstate and intrastate.

A. We apportioned that arbitrarily, twenty five percent to the state business and seventy five percent to the interstate business.

Q. Was that on the theory that twenty five percent of the use of the Pullmans was by intrastate passengers?

A. It was on the theory that not to exceed twenty five percent of the Pullmans would be by state passengers.

We thought twenty five percent was a liberal estimate.

Q. I think likely it is an over-estimate.

A. We thought it would fully cover any use of the Pullmans by state passengers.

3191 Q. I see the cost of mail and express business was ascertained before making the division of coach and Pullman expense: how did you reach that? That is in the eighth subdivision that I am referring to.

A. Well, that is explained in this exhibit; principally on the car mileage basis, or where the same cars were used for mail and express, by an apportionment on the space actually used by the two classes of business.

Q. Which page is that apportioned?

A. Under the various heads. It enters into all, practically all the different items of express.

Q. I was looking for the head where you made a charge of ten cents on that mail business; that was on station service?

A. Yes, sir.

Q. That is (*a*) under 4?

A. Yes, sir. We made an allowance of ten cents per day for handling of mail at certain stations.

Q. What was the reason for that?

A. That is an estimate of the amount it would cost them to deliver the mail where the contract required that the railroad deliver the mail to the post office.

Q. That is an item of expense to the railroad, is it not?

A. Oh, yes, sir.

Q. I believe you had some eminent railroad mail expert

3192 testifying to that did you not?

A. Yes, sir, we had the testimony of some railroad official given in conection with mail service. I think it was Mr. Peabody of the Santa Fe.

Q. I believe Mr. Wharton said it was Mr. Teachout.

Mr. Ludlam, in your opinion what do you think of these bases of expense between state and interstate, which these exhibits which we have gone over have worked out, as comparable with other methods of dividing state and interstate business and expenses?

A. I think they are as nearly correct as it is possible to make them.

Q. How do you think it compares with the ton mile division; or bases of division of expense which have been used in the Missouri cases and probably in other cases?

A. I think it is an improvement over the division on a flat ton mile basis.

Q. In the Missouri case, I believe, after making a division on the flat ton mile, there were additions made to cover extra cost, based upon opinion: is that correct?

A. Yes, sir.

Q. What do you think of this as compared to the flat ton mile where part of the results were dependent upon opinion evidence, without data?

A. I think we get nearer to the actual facts in this division than in an allowance made largely upon a basis of judgment.

3193 Q. Here is the statement of Mr. McPherson giving his reasons why the ton mile basis is not a true basis (Volume 1, page 327):

"The 'ton mile' basis has been considered academically and discussed as available for the purposes of determining cost, but it will not bear the application of practical facts, nor stand an analysis from an operating standpoint.

It must assume, if it is to truthfully reflect the cost of operation, that all commodities can be reduced to a common basis of transportation cost."

That is the first proposition: Now, Mr. Ludlam, is that statement true? How, whatever may be its truth applied to the ton mileage, is that true, and can this criticism be justly directed towards the method of apportionment of cost which you have worked out in this exhibit?

A. We think not.

Q. Why?

A. Because we have determined the cost of the local trains and the cost of the through trains, and then apportioned those costs between the state and the interstate business, on the basis of the tonnage of each class of business handled by the two classes of train.

3194 Q. That obviates the reduction of all commodities "To a common basis of transportation cost," to use Mr. McPherson's language?

A. Yes, sir.

Q. When you came to the passenger side of the question have you obviated that——

A. Yes, sir, we think so.

Q. —by separating it?

A. By determining the cost of the different classes of service and apportioning that on the basis of the service rendered.

Q. The next objection he has is this:

"Further, it must assume that all conditions on railway com-

panies are alike, and that the conditions on each railway are alike in all of its parts, divisions, and districts."

Is this division subject to that criticism?

A. No, sir, we think not, because we have again, as I say, apportioned the train cost and the cost of the train are apportioned upon the business handled by the train.

Q. Next he says:

"It must assume also, that a short haul and a long haul of traffic may be made at pro rata cost."

Q. Have you taken care of that?

A. We think so, because we determined the cost of the local trains and the cost of the through trains. The local trains
3195 would naturally handle the short haul and the through trains the long haul business.

Q. Next he says:

"It must likewise assume that the efficiency of the cars in intrastate and interstate traffic is equal."

What do you say to that criticism?

A. We have distributed the expense of the car according to the train under which it was handled.

Q. So there is no assumption in this case at all, then?

A. No, sir.

Q. He says:

"It must also assume that every ton mile moved over the railway uses all facilities that every other ton mile moved over the railway uses, and that every ton mile moved over the railway uses all the facilities provided by the railway company for its operation:" what do you say to that?

A. Having made specific allowance for the increased cost of switching and repairs incident to the local service—that is, the service of local trains, and distributed the station expense on the basis of the tonnage handled at the station, we think this method takes care of that.

Q. And removes the objections which he and others have indicated toward that ton mile theory?

A. Yes, sir, it seems so to us.

Q. Let us analyze again these objections and see how
3196 nearly applicable they are to the revenue theory, Mr. Ludlam:

He says, referring to the ton mile basis:

"It must assume, if it is to truthfully reflect the cost of operation, that all commodities can be reduced to a common basis of transportation:"

What does the revenue theory assume on that subject?

A. I think that it would assume that far more than the flat ton mile theory on account of the large fluctuations in the revenue on the different lengths of haul, and without any regard whatever to the actual cost of earning that revenue.

Q. Taking all these divergent revenues and reducing them to a common level as representative of the cost?

A. Yes, sir.

Q. The flat ton mile, would, in a measure, do that same thing, if you did not make allowance for these extra costs?

A. Yes, if you did not make allowances.

Q. Next he says:

"Further, it must assume that all conditions on railway companies are alike, and that the conditions on each railway are alike in all of its parts, divisions and districts:"

How does that fit the revenue theory?

3197 A. That would apply specifically to the revenue theory in so far as the trans-state business is concerned, where the revenue is apportioned on a track mileage basis without regard to the expense of operating, or the difference in expense of operating different divisions, and the question of the engine capacity on different portions of the road. That is, where the revenue is pro-rated on a mileage basis it necessarily is exactly the same for each mile in the State of Arkansas. Whereas, according to the testimony that has been given, and also, it is a well-known fact, that the actual cost of operating varies not only on different railroads but on each division of a railroad.

Q. In the exhibits in this case, as I understand it, the trans-state revenue is arrived at by taking a mileage division based on the main line of the road, is it not?

A. Yes, on the line of railroad over which the traffic moved.

Q. I should not have said the main line; I meant the single track mileage over which it moves. I meant it does not take into consideration the sidetracks, or anything of that kind in making the apportionment.

A. No, sir.

Q. Now, if there was a division of the rate in Missouri that owing to grades it would be very much more expensive to operate than a division in Arkansas, to use Mr. McPherson's language, that revenue basis would make the condition on each railroad alike

3198 in all of its parts, divisions and districts?

A. Absolutely, where you distribute your gross earnings on a mileage basis you apportion to each mile of track over which that freight moves, exactly the same amount of revenue, and then when you take your expenses as a per cent of that revenue, you necessarily assume that the cost is identical on each mile of road. Nothing could be more level than that.

Q. He next says:

"It must assume also, that a short haul and a long haul of traffic may be made at pro-rata cost":

What assumptions of that kind do you find in the revenue basis, if any?

A. As a general average, the revenue is greater per ton per mile on the short haul than it is on the long haul, but there are constant exceptions to that, as can be shown by the rate.

For instance, the revenue theory would assume that it cost far more to move a car of sugar, we will say—assuming that the rate on sugar and salt varies as much in Arkansas as it does in some

cases—than it would a car of salt of the same weight, the same distance.

That is to say, it would level the expense of moving the car of salt and the car of sugar to an average of the two. It would overcharge on one car and undercharge on the other, according as the revenue fluctuated.

Q. He next says:

"It must likewise assume that the efficiency of cars in inter-
3199 state and intrastate traffic is equal":

What will the revenue theory do with that?

A. Well, the revenue theory will assume, for instance, that the efficiency of the car, we will say delivering less than car load freight, was only one half as great in the case of the interstate as it would be in the case of the state freight, because they would be receiving only one half as much per ton per mile on the movement of that freight.

Q. I believe it is in evidence here that as a matter of fact they are handled about the same.

A. They are both handled in the same car, right beside each other. The same car; the same crew, and the same station force.

Q. Now, he says next:

"It must also assume that every ton mile moved over the railway uses all facilities that every other ton mile moved over the railway uses, and that every ton mile moved over the railway uses all the facilities provided by the railway company for its operation":

What assumption, if any, does the revenue basis take in regard to the use of the facilities of a railroad?

A. Well, if the revenue basis is used to apportion the expenses, you take the per cent which all the expenses bore to all the reve-
3200 nue, and necessarily all the expenses include all those items of expense.

Q. Spread it out to every class of traffic, whether used or not.

A. Yes, sir.

Q. And make no allowance, as you have made here, for extra cost of any particular kind, not extra cost, but as near as possible the exact cost of each line of traffic?

A. No allowance whatever.

Q. Mr. Ludlam, should there be any depreciation charged in these accounts when you are seeking to divide state and interstate business?

A. No, sir, I think not.

Q. Why not, I wish you would explain your views about that?

A. Because the charges made by the railroad for maintenance of its way and structures and its maintenance of equipment, provides for the depreciation of property. It is a well known fact that taking the railroads as a whole, throughout the country, that during the last fifteen or twenty years, the properties have been vastly improved. That the cost of operation, that is, that the charges made to operating expenses for maintenance both of roadway and track and of equipment, have resulted in actually improving the road-
3201 way and largely increasing the efficiency of the equipment of railroad property.

When a rail wears out, for instance, and a new rail is put in to take its place, the expense of that replacement is charged to the operating expenses. That same plan is followed and has been followed out by the railroads generally throughout the country.

Q. Take a new tie: how is that taken care of?

A. The same practice prevails, an old worn tie is taken out of the track and a new tie is placed in the track to take its place. All the expense in connection with that transaction is charged to the operating expenses of the company.

I should say, speaking generally, and I have no doubt that would apply to the Iron Mountain in the state of Arkansas—it certainly would to all of the large railroads throughout the country,—that during the last ten years there has been a large appreciation in the property rather than any depreciation through the charges which have been made to the operating expenses of the different companies.

In fact, I think it is believed by a great many people, that an actual appraisal of the railroads made today would show a valuation far in excess of the original cost of the property.

Q. That is on account of this process that you are speaking of?

A. Yes; constant improvement going on in the railroads and has been for the last twenty years and it has been the practice
3202 in this country to charge a large proportion of those improvements and betterments against the operating expenses of the property.

Q. The Interstate Commerce Commission has made some rule on that subject, has it not?

A. Yes. They have recently required the railroad companies to charge specifically against their operating expenses for the depreciation on their equipment and that has been done in my judgment, to a very large extent, to prevent the overcharging to operating expenses of new equipment.

Q. Do you know when that rule went into effect?

A. I think it was July 1, 1907. It was two or three years ago.

Q. Now, Mr. Ludlam, on this division of mail and express, miscellaneous expenses growing out of the mail and express and other miscellaneous sources, the railroads in this case have begun by setting apart the proportion of expenses on the revenue basis and leaving the freight and passenger business to be taken care of on another basis:

I wish you would express your views about the soundness of that method of division?

A. I think that method of attempting to determine the expenses applicable to the mail and express business is erroneous, as is
3203 any other based on the revenue basis. It is assumed to start with, that the proportion of cost of doing the mail business is the same as the proportion of cost of all of the other business done by the company. It has not relation to the actual facts in the matter.

Q. Is there any reason why the proportion of that cannot be ascertained on a very definite basis instead of adopting this revenue theory?

A. We think that in our statement we have determined the approximate cost of doing that business, certainly far more accurate than any apportionment on a revenue basis could be.

Q. To illustrate your point: It is in evidence here that some twenty years ago the Missouri Pacific Railroad Company made a contract with the Pacific Express Company by which the railroad company was to receive 50% of the gross earnings of the express company and have the exclusive privilege of doing express business on the Missouri Pacific line then owned and after acquired and controlled by it.

In consideration of that contract it also gave the Missouri Pacific Railroad Company 40% of the capital stock of the express company, amounting to $2,400,000.

It is also in evidence that that capital stock has been for many years paying the Missouri Pacific Railroad Company 6% actual dividends. It is not in evidence how much service they have performed, but they are paying those dividends and paying them with great regularity and precision.

3204 Now, assume as a legal proposition that the Iron Mountain is entitled to a part of the stock as a part of the price for carrying the express: what effect would that have on this division of property and division of expenses on the revenue basis?

A. Any dividends received on that stock which would apply to the Iron Mountain Railroad Company or any earnings of the express company over and above the dividends which it actually paid which would be applicable to the Iron Mountain Railroad Company, if considered in the light of additional remuneration for carrying express business, would immediately increase the express earnings of the railroad company and attempting to determine their expenses on a revenue basis, the expense of conducting the express business would be correspondingly increased immediately.

Q. And would leave a smaller percentage to be worked out between state and interstate?

A. Freight and passenger.

Q. I meant to say freight and passenger, and following that between state and interstate?

A. Yes, and an illustration there of the fallacy of the revenue basis is accorded by the face of this contract.

If the express company—disregarding for a moment the dividends and surplus earnings of the express company—sees fit to raise or lower its rates for carrying express matter, the expenses of the

3205 railroad are immediately increased or decreased accordingly, inasmuch as the railroad company receives 50% of the gross earnings of the express company as their proportion of the express earnings. And if you distributed the expenses on a revenue basis, the expenses would fluctuate every time the express company raised or lowered their rates.

Q. There has been quite an agitation going on about the price of carrying mails: suppose Uncle Sam would think the railroads are badly oppressed and did not get enough money for it and increased their mail rates: what effect would that have on the division of the expenses?

A. Apportioned on a revenue basis, if the company received more money for carrying mail, the expense of carrying the mail would immediately increase correspondingly.

Q. Without any change in the service?

A. Without any change in the service.

Q. And if it was lowered it would work the other way?

A. If they reduced the amount paid the railroad company for carrying the mail, the expense, if apportioned on a revenue basis, would immediately decrease.

Q. And you would have a bigger problem to work out between your freight and passenger?

A. The expenses assigned to the freight and passenger business would be correspondingly increased.

Q. Mr. Ludlam, there has been a great deal said in this case about the trans-state business and the cheapness of trans-
3206 portation of freight on trans-state trains:

I want to read you a statement of Mr. McPherson (Vol. 1, page 326):

"The railway company establishes by accurate test, the hauling capacity of each locomotive, over a particular district or division to which it is assigned, and this establishes a measure that we designate as the 'potential capacity' of the locomotive, and the number of tons the locomotive draws from day to day is recorded, to determine whether the operating officers in charge of the various divisions or districts, are securing the full measure of the efficiency of the power."

3207 Q. In handling trans-state freight through Arkansas, say into Moselle, it would have about these routes to follow:

The main line from St. Louis to Texarkana, what you might call the eastern Illinois line down the east side of the river, over this Paragould leased track that has been referred to, of the Cotton Belt; or, from the northwest over the White River branch down to the connection of the main line at Diaz, close to New Port—just north of Newport; and west over the Little Rock & Fort Smith line; starting in at the state line at Van Buren and then going from Little Rock towards Louisiana, it would go to Alexandria, passing through Pine Bluff; then from Memphis, coming in from the east via Bald Knob and then south to Little Rock. Then, of course, the reverse movement, taking in those routes from the north, east or west, as the case may be:

Now, if you have any data to show the potential capacity of the locomotives on those routes I wish you would put it in evidence.

A. We have prepared an exhibit showing the tonnage capacity of engines on the St. Louis, Iron Mountain & Southern Railway Company in freight service, as shown by official timecards, issued for the government of employés only, effective during the last half of 1909, compared on the various operating districts over which so-called "trans-state" trains would pass through the state of Arkansas.

3208 As various classes of engines with varying tonnage ratings are in service on the different districts, the maximum rating on each district has been used below as the basis of comparison.

The paper last referred to is marked "Defendant's Exhibit W, Chas. S. Ludlam, 6/1/1910, M. J. C." and is in the words and figures as follows, to wit:

For Exhibit "W", see Volume 9, page 5833.

3209 Q. What would be the direct effect of this upon these so-called "trans-state" trains moving through the state like they are on a bridge, Mr. Ludlam?

A. It shows that such a train would be an impossibility.

Q. Suppose there was a train of trans-state freight made up at St. Louis, going south; that would have one of two routes to take: one on the main line via Poplar Bluff and those hills north of that—I have forgotten the name—and the other using this leased line that they lease from the Cotton Belt track:

What would be the effect of the operation of a train of that kind?

A. The official time-table, number 16, of the St. Louis, Iron Mountain & Southern, taking effect July 4, 1909, shows that any one of the engines, from number 1 to number 100, could haul 1900 tons from St. Louis to De Soto, but that any one of those same engines could only haul 900 tons from De Soto to Piedmont. That is, the train would have to be more than divided in two when it got to De Soto.

When it got to Piedmont it could haul from Piedmont to Hoxie 2300 tons. In order to run through from St. Louis to Hoxie the train would have to have 1,000 tons less than the capacity of the engine between St. Louis and De Soto, and it would have to have 1400 tons less than the capacity of the engine between Piedmont and Hoxie. That is, the engine would be working about one-half its capacity a large part of the distance—one-half or less than one-half of its capacity.

3210 Q. Of course that would necessarily mean the breaking up of the train?

A. Yes, sir.

Q. Now, supposing instead of taking that route they took this other low grade route: I don't care about going into ratings on that, but just call attention to this, that it is a low grade line:

That would be more economical to operate, I presume, than this other?

A. If it is a low grade line it undoubtedly would be.

Q. And this trans-state matter either must take the expensive operation on the main line, or else go to the expense of hiring another track on another railroad, to take care of it?

A. In order to operate more economically—in order to handle it cheaper, yes, sir.

Q. Where does the benefit to the state of Arkansas come in on that sort of economical management of these trans-state trains through Missouri and over these leased lines, or out here in Missouri and eastern Arkansas?

A. Arkansas would not be interested in the economical operation of trans-state freight.

Q. Here is a statement of Mr. McPherson's on page 357:

"Exhibit 5 shows that for the six months ending December 31,

1907, the average length of haul of all intrastate freight was 70 miles, while the average length of haul of all interstate freight in Arkansas was 224 miles.

3211 This means that each shipment of interstate freight moves on an average of 224 miles with but one terminal expense, either that of forwarding or delivering. Each intrastate shipment moves on an average of but 70 miles and incurs two terminal costs for that distance."

He goes into that at considerable length and makes a calculation of eight times the expenses of the intrastate, for one of the interstate.

He does that on the use of equipment, the station handlings, and I have forgotten how many other things he runs that proposition into:

In your exhibits, have you take- care of the division of cost of those station handlings, and if so, how have you done so?

A. I presume in his testimony, Mr. McPherson uses the word "terminal" in the sense of the station expense, as I am sure neither Mr. McPherson nor any other railroad man, would state that each shipment of interstate freight moves on an average of 224 miles, with but one terminal; because it is well known that each shipment of interstate has a terminal expense at each division terminal, which, as I understand it, in the state of Arkansas is approximately 100 miles.

Therefore, if he uses the word "terminal" in the sense I assume he does, as meaning the station expense, we have provided for that by apportioning the station expenses actually incurred in the state of Arkansas upon the basis of the tons of freight handled in the state of Arkansas.

3212 Q. So the ton miles that he used to illustrate it, would have no bearing if you have taken care of it in the actual tonnage?

A. It would not apply in any sense.

Q. You have taken care of it directly between state and interstate?

A. Yes, sir.

Q. So his eight times one, if that be correct on a ton mile division, has been taken care of absolutely?

A. Yes, in my judgment it has.

Q. Then he uses that in regard to the equipment, maintenance of equipment, too, I think?

A Yes, sir.

Q. Have you taken care of the eight times one, as he puts it there, in connection with that?

A. Having made provision for the increased expense of maintenance of freight cars on account of the more frequent starting and stopping of local trains, on account of the terminal handlings, we think we have fully covered that feature of the question.

Q. You have done that between the local and through, of course?

A. Yes, sir.

Q. Separating each one and taking care of all the extra expense

growing out of the point he raises there, wherever it is applicable?

A. Yes, sir; we think so.

3213 Q. There is some criticism made of your station handlings, allowing two for intrastate and one for interstate when there is some part of the business trans-state which does not have as much station handling as the other:

I wish you would explain why you adopted the plan stated in your exhibit.

A. We have charged the state tonnage with two station handlings, assuming that each ton of state freight would be handled twice, at its originating and terminating points.

We have charged each ton of interstate freight with one handling, assuming that each ton of interstate freight would be handled once.

While we recognize the fact that there is certain of the interstate freight that is trans-state and therefore would not have specific station handlings within the state, we think that there is a large part of the interstate business that would have two handlings.

That would apply specifically in cases of freight into and out of Memphis, the expenses of the Memphis station being included as an expense of the state of Arkansas.

It would also include the handling of interstate freight into and out of Fort Smith.

It would also include the interchange made within the state of Arkansas of trans-state freight with other roads, which would constitute a large proportion of the trans-state business of the Iron Mountain road in the state of Arkansas.

3214 Q. Taking all those elements into consideration, you felt like you had made sufficient allowance for that?

A. Yes, taking all those elements into consideration we thought that a very fair apportionment would be to charge the interstate freight with one handling on the average within the state of Arkansas, and the state freight with two handlings.

Q. Mr. McPherson has also run his eight to one proposition into what you might designate as the "lost car movement": Have you taken care of that in your apportionment of expenses?

A. Not altogether, no sir. We have apportioned the maintenance of freight cars between the through trains and the local trains, and then apportioned that expense on the basis of the business done by the two classes of trains. But there is an element of fact in the statement that there would be more lost time of equipment on the short haul business than there would be on the long haul business, but in my judgment, not to anything like the extent that Mr. McPherson states. Furthermore, I think it would be largely offset by the tremendous amount of empty car mileage made for the purpose of handling interstate business, which appertains in a far greater measure to interstate or long haul business, than it would to the short haul or state business.

3215 Q. So you do not think there is an element there that needs to be taken care of as an item of extra expense charged to the state?

A. No, I think it would be so small as to be—to use a word I have seen used in this case a good many times—negligible.

3216 Cross-examination of Mr. CHAS. S. LUDLAM.

By Mr. MOORE:

Q. Have you examined the books and accounts of the railroads engaged in this litigation?

A. No, sir. I have examined some of the accounts, but not the books.

Q. What was the character of your employment with the Atlantic & Pacific Railroad at Albuquerque, New Mexico?

A. I was employed in the Auditor's office in the bookkeeping department.

Q. You were very young then, of course?

A. Yes, sir.

Q. What was the length of that Pecos Valley Railroad at the time you were employed down there?

A. When I first went to Eddy, New Mexico, it was ninety miles, and during my connection with the road, it was extended to a distance of 175 miles.

Q. How long were you engaged in connection with that road?

A. About two years and a half.

Q. Then you went to New York?

3217 A. Yes, sir.

Q. Have you adopted and put into force the methods taken in Exhibit 5 in this case by Mr. Wharton, in connection with railroads whose accounts you have revised at any time?

A. No, sir.

Q. Do you think it would be practicable to keep the accounts of a railroad in that manner?

A. If that information was desired, I think it would be practicable to devise a system of accounting that would give practically the same information.

Q. How about the expense of it?

A. It would increase the expense of the accounting department.

Q. Quite considerably wouldn't it?

A. Somewhat, I don't think very materially.

Q. The state has found it very expensive to make the investigation that has been made in these cases, for the purpose of preparing the exhibits referred to?

A. Yes, sir.

Q. It required a long time?

A. Yes, sir.

Q. And a great deal of clerical labor?

A. Yes, sir, but of course, if the books were laid out to segregate the information in this order, at the time it was compiled, it would be less expensive than to attempt to go back and segregate it after the records had been completed.

3218 Q. You have spoken, in saying that it was possible to keep the books in this way by a railroad and arrange the ac-

counts in that way, you have spoken now with reference to the expense that could be allocated, but there is a part of the expense you have got to assume in this case as you have done in making the exhibits. You know what I refer to. You could not devise a practical system of bookkeeping for a railroad, based upon assumptions that way, that you would regard as a proper method of keeping accounts?

A. Yes, I think that an equitable division or apportionment of those expenses that could not be specifically allocated, could be worked out that would be reliable for all practical purposes.

Q. For instance, the allowance of extra expense on account of two terminal handlings against one, and that sort of thing, involving an assumption of what the increase would be on that account, would have to be treated and carried in the books as an assumption, wouldn't it?

A. That could be pretty accurately located.

Q. Is it practical, do you think, to adopt the cost system of accounting for railroads, such as is used in ordinary industries?

A. It is entirely possible; whether it is practical or not would depend upon the necessity for such action.

Q. Referring to your statement that the operating man is in a general way the last man who is able to figure out what his costs
3219 are, isn't it a fact that the economies of operation are more closely under the observation of operating men, and that they have better opportunities of studying and determining what they are, than men in other departments?

A. Information as to the results of the operating department are constantly furnished by the operating department to the accounting department, and the operating man keeps in touch, through the accounting department, with his costs.

Q. That is all very true, but as I refer now to the cost of a given operation, the cost of switching an engine, the cost of switching service say, the man on the ground, whose time and experience is devoted to the conduct of the affairs of that account, would be in a better position to determine what the cost in detail was, than the accounting official at headquarters, wouldn't he?

A. No, sir.

Q. You think not?

A. No, sir, I think if the president of a railroad wanted to know what his switching cost him during the previous year, he would make inquiry of the accounting department, not of the operating department.

Q. Of course, he will do that, because there is a record in which and by which it is kept, but doesn't the accounting department base its records upon information obtained from the operating department?

A. No, sir, they base their records upon the records of the
3220 work which is actually done; of course, to the extent that the operating man reports his transactions, the accounting department is dependent upon his statements. I mean by that, regarding the conductors and operating men; the accounting department depends upon his statements as to how far he runs, what cars he

picks up, and what cars he sets out, but the details of those items as applied to cost and expenses are worked out by the accounting department.

Q. Has the accounting department any information about the movement of trains, handling of cars, cars picked up, cars set out, and cars that are carried to the machine shops for repairs, has it any information at all in regard to that, except as it is obtained from the operating department?

A. Only as reported by the operating department.

Q. Is that reported to the accounting department?

A. That depends upon the system in vogue at the different companies' offices.

Q. There is necessarily involved in the handling of trains, a great multitude of small details, perhaps the greater part of the expense is made up of matters that in themselves taken separately, would be minor expenses, and it is the aggregate of them that creates a large outlay. Now, it would be impracticable for a mass of details like that to be reported to the auditing department as the basis of accounts, would it not?

A. There is not a dollar received by a railroad or a dollar
3221 paid out by a railroad, that does not pass through the accounting department's records.

Q. I thoroughly understand that; that is bound to be the case, but a dollar or five dollars may be paid out at the yard or in the machine shop at Little Rock, to operatives who may be engaged during the time these repairs are made, in various and different employments. Now, he is paid in gross. Does the accounting department know in detail the various and different kinds of work, for which the payment is made?

A. Yes, sir, the distribution of the pay roll would show that.

Q. Who makes that distribution of the pay roll?

A. That varies on different roads; the system varies; on some roads it is made in the accounting department; in other roads, it is made in the operating department, subject to the verification of the accounting department, under the direction of the accounting department.

Q. How can the accounting department make a distribution of matters of that sort, which are carried on at a distance usually from where the accounts are kept?

A. The time book shows the class of work on which the employee was engaged, and the accounting department distributes the charge accordingly.

Q. Doesn't the operating man control the pay roll for the various kinds of service that is performed?

A. As to the employment of the individual, absolutely.

Q. Doesn't he know the conditions under which the work
3222 in his department is done, better than another man who is not on the ground and without the same means of observation?

A. He knows naturally what his men are doing, and what they

should do, but after that has been determined, the accounting department decides how the expenses incurred as found by such observation, shall be charged.

Q. You stated yesterday, that you could remember when the general manager would instruct the auditor how to charge certain expenses; now, isn't that controlled by the rules fixed by the Interstate Commerce Commission, as far as interstate roads are concerned?

A. Very largely. The Interstate Commerce Commission holds the accounting department responsible for distributing the charges.

Q. It has come about now that the operating man cannot doctor his reports as you suggested had been done formerly?

A. No, sir, he cannot.

Q. You were engaged for nearly three years in the Missouri case?

A. Off and on.

Q. You said also you made a study of the unusual expense of the road under the division made between state and interstate expense in that case?

A. Yes, sir.

Q. Were the Iron Mountain and the Cotton Belt roads parties to that proceeding, do you remember?

3223 A. I do not remember.

Q. The Missouri Pacific was, wasn't it?

A. Yes, sir.

Q. Did you go into that case on the same lines as you have in this case?

A. Our employment was the same.

Q. Did you divide the cost of operation as between state and interstate business there in the same way that you have in this case?

A. No, sir.

Q. Why not?

A. We think we have gone further in this case than we did in the Missouri case.

Q. What was your method of division in that case?

A. The ton mile basis with certain additions for extra cost of handling state business.

Q. You testified in that case, didn t you?

A. Yes, sir.

Q. Did you not testify in that case that in the judgment of the accountants engaged in the case, the ton mile basis was the only way in which the difference in cost could be ascertained?

A. Can you tell me what page of the record that is?

Q. It is page- 1189-90; did you not state that the only way to ascertain the actual cost was the ton mile basis; I will read you the question:

3224 "Q. The ton mile is not the question, the revenue is not the question; the thing to be desired would be to ascertain the actual cost if you could ascertain it in any way."

And your answer was:

"A. In our judgment, the ton mile basis is the only way it could be ascertained.

A. Yes, sir, I so testified. It should be understood in that connection, that in that case we did not have the division of expense between local and through trains; that testimony was applicable to the facts in that case.

Q. You had two or three years to get that information, more time than you did in this work?

A. We were engaged on that case approximately for two and a half or three years, but we didn't have those statistics. I might say in that connection, we have gone, we think, further than we did in the Missouri case.

Q. You stated, I believe, that you did not have the information in that case. How did you compile, obtain the data upon which you base the exhibits that you filed in this case by Mr. Wharton?

A. What data do you refer to?

Q. I mean all the data which is the foundation of Exhibit "I."

A. Well, the statistics were worked up from the records in the various departments of the two railroads.

3225 Q. What statistics is that Exhibit "I" based on?

A. The statistics shown. The statistics shown on Exhibit "I," are the ton miles of freight intrastate, divided between carload and less than carload, and the ton miles of freight interstate, divided between carload and less than carload.

Q. What I meant to ask you was, what records you got the statistical information from, as contained in the Exhibit?

A. Various records; it was not all obtained from one record.

Q. Take on the St. Louis, Iron Mountain & Southern Railway, what record is the principal foundation of that exhibit, and the division which you have attempted to make between local and through train costs, in the exhibits that accompany that statement?

A. I presume you refer to the car miles by local and through trains, and if that is the case, we took the car miles, total car miles in the State of Arkansas, as shown by the Company.

Q. Where did you obtain that? Do the wheel reports enter into it?

A. I couldn't tell you where we got the total figures. Mr. Hamilton obtained those, he can explain that; I know we worked up the mileage of local trains from wheel reports and deducted that from the total mileage.

Q. You got one of your factors from the wheel reports?

A. Yes, sir.

3226 Q. Then where did you get the information upon which you base your comparison between the month of October and the six months, the last six months in 1907?

A. I don't think we have made any comparison; we have taken the month of October——

Q. Did you not obtain your percentages for the purpose of dividing state and interstate business from the record of the operations of the Iron Mountain road for October, 1907, and the wheel reports covering that period?

A. Yes, sir.

Q. And you make that the basis of the division, the apportionment for the six months business, do you not?

A. Yes, sir. I started to explain that in answer to the second question back, to state that we did not make a comparison between October and the six months period, but we used the figures for the month of October to apportion the six months figures on.

Q. When did you work up the October statistics?

A. Since we have been working on this case. I couldn't tell you the exact date.

Q. Was it from the summer of 1909 until winter of 1909 and 1910?

A. I think probably it was.

Q. Some year and a half or two years after the period covered by those records, was it?

A. Yes, sir.

Q. The same was true on the Cotton Belt also?

A. A year and a half or two years, yes, sir.

3227 Q. You were asked this question at page 2015-6, in the Missouri case:

"Certain exhibits have been offered here by the railway company as Exhibits 14-A and Exhibit 15, which show the tonnage of both state and interstate freight carried by certain through trains on certain dates in December, and also certain local trains on certain dates in December, 1906; now this information, I understand that testimony was obtained from the testimony of men who went along with those trains and set out with the train. Was that your understanding?"

You say "Yes."

"Q. Is there any other practicable way of getting that information accurately as to what makes up the tonnage of particular trains, whether they be local trains or through trains?"

To which you answer: "No, sir, there is no other method that is practicable."

"Q. Is it practicable to ascertain that information from the books and records of the company subsequent to the operation of the trains and the handling of them?

"A. No, sir, in my opinion it is not practical."

Now, I want to ask you if those statements are not equally applicable to the same kind of information on the Iron Mountain Railroad?

A. No, sir.

Q. What is the difference?

A. That was my testimony in the Chicago, Burlington &
3228 Quincy Railroad Co. case, and all the waybills prior to September of our examination had been destroyed.

Q. This testimony was in the Missouri Pacific case?

A. No, sir, this was in the Chicago, Burlington & Quincy Railroad case.

Q. Wasn't the exhibit furnished by the Missouri Pacific, the one you were talking about?

A. No, sir, it says the Chicago, Burlington & Quincy Railroad case.

Q. I will ask you if you are mistaken about its being another road, and if those exhibits did relate to the Missouri Pacific?

A. Exhibit 14 relates to the Missouri Pacific, and I presume 14-A does.

Q. Why was that statement that I have just read from your testimony in that case, not equally applicable to the statement upon which these exhibits are based?

A. I should assume that I was referring to the less than carload business.

Q. What difference would that make; you say, it is not practical to get information of that kind except by having a man go along to make observations. That was your testimony.

A. It was my testimony that it would not be practical.

Q. And in this case you are attempting to obtain the tonnage by a wholly different manner, by records two or three years
3229 after the business was done, in the case now in hand?

A. Yes, sir we have traced out the train; we handled the carload business by going back to the wheel reports; in the Missouri Pacific case which you referred to, we did not think that was practical on account of the immense amount of labor involved in the operation; here, however, we have performed that labor.

Q. You didn't make that qualification in your testimony then, you just simply said:

"It is not practicable to ascertain that information from the books and records of the trains," and that the only way you could get the information was to put a man on the trains?

A. I was referring there probably to all the business, carload and less than carload, both.

Q. Are you not referring here in these exhibits to all business?

A. No, sir, we have only specifically allocated the carload business, and we have assumed, we think, very much more of the expense of state business than it should bear, as we assumed that all state less than carload business was moved by local trains.

Q. What do you base that assumption on?

A. On the assumption that a large part of the state less than carload business would be moved on local trains?

Q. Did you have any evidence of that fact?

A. General knowledge.

3230 Q. So to get right at the root of the whole thing, you have acted, not on knowledge, not on actual known conditions, but upon assumptions of facts?

A. We have actual knowledge of known conditions, that a large part of the state less than carload business moves on local trains, but I am willing to admit that we think we have burdened the state business by assuming that all of it moved on local trains.

Q. I am speaking about the claim that has been made for these exhibits, that they represent actual facts, but right in the inception, it is based largely on assumption, isn't it?

A. It is based on an assumption to a certain extent. I would not

say largely, because to start with, the less than carload business represents only a small proportion of the total business.

Q. You have criticized rather severely, the testimony of Mr. Frank Nay of the Rock Island Road, referring to the statement made toward the conclusion of Mr. Nay's testimony, that "after making the basic approximation of the operating expenses for intrastate freight or passenger traffic, the figures thus arrived at may be increased in the proper proportion to represent the excess of the cost of transporting intrastate traffic over the cost of transporting interstate traffic."

3231 *You* also quoted a similar statement from Mr. McPherson's testimony, and in presenting your views which you say those conclusions to which I have just called your attention, as testified by Mr. Nay and Mr. McPherson, demonstrated the fallacy of their position, you say Mr. Nay has built up a snow man, and in the body of his testimony, and in the conclusion he destroys it.

Now, did you not do the same thing in the theory propounded by you and your associates, Haskins & Sells, in the Missouri case, in which you and Mr. Taliaferro testified, that the ton mile was a proper unit to divide the expenses in apportioning the expense of operation between state and interstate, and that any extra cost could be added after that division had been made as between the two; didn't you make the assumption there that you criticised so severely in this case?

A. No, sir, I don't think so.

Q. How did you arrive at the extra expense? You and Mr. Taliaferro both testified there would be an extra expense in the conduct of state traffic over interstate traffic in that case? How did you propose to give the state business credit for that on that division, in your testimony in that case?

A. A specific allowance for those items where we knew the specific cost was greater in the case of one business than in the case of another business, was made.

3232 Q. What is the difference between making an allowance of 50% on account of some extra expense in dividing the expense of maintenance of way on a car mile basis between local and through trains, for the purpose of taking care of the extra expense growing out of the supposed extra service for which allowance is made, and the increase of the amount that may be apportioned on the ton mile basis or the revenue basis, as a unit, after you have made the apportionment?

Tell me what the difference is. You have done that all through this case.

A. In the case of the addition made by us to the proportion of the expense of maintenance of way applicable to the local trains, we have made additions to the local car mileage on account of the increased switching and the more frequent stops of local trains, which we think is perfectly consistent with the statement of facts as developed in this case by the testimony, and is well known from railroad practice in general, whereas in the revenue theory, Mr. Nay says that all those things are taken into consideration in fixing the rates,

Assuming his premise is well founded, then there is no excuse, after you reach a conclusion on that basis which is done by taking elements of increased cost into consideration, in adding to the result thus obtained.

3233 One of two things must be wrong, either the rates do not take those elements into consideration or else you cannot add anything.

We say specifically that the car mile does not take those elements into consideration, and, therefore, there are certain conditions you must make allowance for, but Mr. Nay says all those things, on the revenue basis, are taken into consideration; and then, after having explained very elaborately, that they are taken into consideration and the rates are based upon that premise, then he says, when you get them proportioned, having gotten it, you must add something to it, because it is not correct.

Q. You refer now to the assumption that has been made in this case that a division of expense between state and interstate business on a straight revenue basis, would involve an extra allowance to state business because of the adjustment of the rates as between those two classes of service?

A. No, sir, I do not assume that, but Mr. Nay does in his essay.

Q. Mr. Nay's testimony, if it touched upon that, you say must have been made with reference to the feature which was developed in the record?

A. I don't say that it must, but he states that it is.

Q. Assuming that he does state that, Mr. Nay's statement

3234 that any extra expense involved in the conduct of local business could be added to the amount ascertained after the division or apportionment had been made, was based was it not, upon the testimony that had been introduced and which indicated that a larger difference existed than would be accounted for by a division on the basis of straight revenue?

A. I can't tell you what it was based upon. In my judgment, it was not based on accounting principles.

Q. The statistics filed in this case by the Iron Mountain and the Cotton Belt is practically the same for the purpose of my question—show that the revenue per ton per mile on state freight was about 13 mills, and on interstate, about half of that.

If we should assume a difference in the rate which would in itself involve an allowance for extra expense in the conduct of the state over the interstate business, and assume further that the testimony in the case showed that the expense of conducting state business was four times as great, instead of double as great, would there have been any thing strange, unusual or illogical, in Mr. Nay's saying, after you had apportioned the expense on a straight revenue basis, if there was still an additional extra amount of expense incident to the conducting of the state business, that that could be provided for by an allowance of whatever the evidence showed would account for the extra expense?

3235 A. The assumption would be founded upon the premise that you suggest. If you assume to start with, that Mr.

Nay knew nothing about the railroad business, and second, that he knew nothing about the rates, and that he did not know that the state rates had no such relation to the interstate rates as you suggest, or that the interstate rates had no such relation to the intra-state rates, if Mr. Nay was writing purely as an essayist who knew nothing whatever about his facts,—knew nothing whatever about the variation in the rates or variation in the costs, that premise would be alright, but Mr. Nay is not writing that way.

Q. There is nothing illogical in the assumption within itself, which differs from your understanding of the facts in the case?

A. As an ethical question; if the state rates were exactly double the interstate rates, and the cost of doing state business was exactly four times the cost of doing interstate business, then there would be nothing objectionable in determining the expenses on the percentage which they bore to the revenue, and in the case of state expenses, doubling them when so ascertained.

Q. In giving your views as to the demerits of the revenue unit of dividing expenses referred to between state and interstate traffic, you say you never heard of the revenue theory being ad-
3236 vanced as a basis of determining expenses except in the Missouri case and Arkansas case.

Haven't you made a study and given investigation to these methods of dividing expenses for sometime back?

A. Dividing what expenses?

Q. Dividing the expenses of operation as between state and interstate business?

A. Not except in the case of the Missouri rate case and the Arkansas rate case.

Q. You were engaged in the Missouri case from 1906 to the conclusion of that case?

A. Yes, sir.

Q. During that period didn't you give it investigation?

A. Yes, sir.

Q. Did you never hear of the case of Ames v. Missouri Pacific Railroad, 169 U. S., Chicago, Milwaukee & St. Paul v. Tompkins, 176 U. S.; same road v. Keys, 91 Fed. The Buel case before the Wisconsin Commission, and the Oklahoma case pending at St. Paul in which your firm is interested, haven't you heard of those cases?

A. Incidentally, but not as an accounting proposition. We were not identified with any of those cases, and I made no study of the question, nor did I go into the bases of divisions in those cases. The Oklahoma case which you refer to, my firm has had no connection with, except to make a certain affidavit as to the State of Arkansas.

3237 Q. You say you think the division of the value of the property in proportion to the gross earnings is wrong. Haven't you made the division upon that basis in your figures in this case?

A. I wouldn't say we have made the division—we have used the companies' bases in apportioning the property.

Q. That is the basis you have been acting upon?

A. That is the basis we have used in our exhibit.

Q. In that connection, you say the cost would more accurately represent the value of the property. Isn't it a fact that the cost of everything that enters into the expense of operation of a railroad is fluctuating constantly?

A. Not as between state and interstate, there is no fluctuation in my judgment; whatever affected the cost of one would affect the cost of the other.

Q. That is the point I want to call your attention to. You say the revenue is not a good unit because of fluctuations of the rates. Is there such an abnormal fluctuation in the rates as would destroy the adjustment between state and interstate rates, unless it may be a condition growing out of such a thing as occurred in this suit, the enjoining of a body of rates put in by an official commission or something like that, but in the ordinary and orderly conduct of the business of a railroad, do such constant fluctuations occur
3238 as would render rates an unstable and fluctuating quantity, to such an extent as to destroy it as a factor?

A. Yes, sir, I think they would.

Q. Your attention was called, and you referred yourself in your testimony, to a difference connected with the changes that grew out of the order made by Judge Vandeventer granting the injunction in this case. Soon after that order was made different rates were put in voluntarily by the railroads—we call them voluntary rates—from those that had been in force under direction of the Commission previously on state business.

Now, there was a period during the change, when the interstate rates were not and could not be readjusted so as to correspond with the new voluntary rates put in by the railroad companies.

Would any sane man take such a period as that as a representative period, for the purpose of ascertaining the relation of cost on the revenue theory between state and interstate business? Has that been done in this case, or would any sane man do it?

A. I think the distribution on the revenue basis must take into consideration all those fluctuations, whether violent, unusual or abnormal.

Q. If you apply that under normal conditions and to a state of affairs normal and yet out of the ordinary, would it be true?
3239 A. My experience is that the rates are constantly fluctuating and changing, particularly the interstate rates of a railroad,—the interstate freight rates—not to the same degree probably as in the case you mentioned, but that is merely a forceful illustration of the disparity which exists.

Q. Can you give me any illustration that will sustain that impression, that the situation is anything like that, that occurred during the year 1907? Can you point out any instances?

A. I would have to make a study of the business of the road for the year 1907, to point out any specific instances.

Q. Isn't it a fact that commercial conditions and necessity throughout the country, requires a larger degree of stability in

railroad rates than your answer would indicate, when you say that interstate rates fluctuate to the extent that would interfere with the application of the revenue as a unit of division?

A. No, sir, I don't think that is the cause—it is not only the fluctuation of the rates, but it is the fluctuation of the movement. Many interstate rates are made to govern large zones and the fluctuation in the movement would affect the revenue materially, whereas it would not affect the expense in any sense.

Q. Let me call your attention to the zone adjustment of the lumber rates, which Mr. Perkins testified was brought about
3240 some years ago by conditions which have abated very much, and Mr. Bee testified that those conditions which caused the adjustment referred to both by him and Mr. Perkins, did not any longer exist, and yet the rate existed?

Is not that a pretty good illustration that the rates are not in the habit of fluctuating and jumping about to any great degree?

A. I don't think it is, because on the basis of the testimony as to that lumber zone, the curtailment of business in the northern end and the increaseed movement from the southern end, would cause a change in the revenue derived by the Iron Mountain on its haul through the State of Arkansas, just the same as a coal strike in one locality might cause a tremendous fluctuation in the revenue on coal, although there would be no specific change in the rate.

Q. If it is true as Judge Wallace testified in this case, and as Mr. Hampton, who until recently was chairman of the State Railroad Commission of Arkansas, and as many other men connected with the traffic and freight departments of the railroads connected with this case have testified, that there is a relation between state and interstate rates and that the interstate rates are influenced by the state rates, would your assumption as to the extent of the fluctuations, if there are fluctuations — to such an extent as would destroy the revenue as a proper factor of division?

3241 A. Yes, sir, I think there are constant fluctuations.

Q. You think those gentlemen are mistaken then?

A. Absolutely. I would like to state——

Q. You base your testimony upon a view which differs from the testimony of those gentlemen to whom I called your attention?

A. Yes, sir.

Q. Now, make any statement you wish to make.

Mr. HILL: You did not state in there what their testimony referred to. It did not refer to the cost of service, it referred to the way one state rate affected the interstate rate.

Mr. MOORE: I am applying it to that,—the way the state rate affects the interstate rate; I did not say anything about the cost.

Mr. HILL: The way you have put that question, it would be assumed that there was a relation of cost.

WITNESS: I think that many individual cases could be picked out to support that testimony; but I think, taking the railroad movement as a whole, it would not hold good.

Mr. MOORE:

Q. What do you base that view on?

A. Those same gentlemen, for instance, testified that in
3242 fixing the rates, the casualty risk was considered, and lost space was considered, and that all of the elements that would enter into the increased cost were considered, and yet I find in the actual movement of railroad traffic, that that situation is not true. While it is true to a certain extent, in the great bulk of railroad movements, the actual conditions do not accord with their theories.

For instance, taking the St. Louis, Iron Mountain & Southern tariff #70, Texas Tariff #1 DD, which was issued by Mr. Cale, Agent, in effect during the last six months of 1907, from St. Louis to Texas common points, a map of which is already in evidence in this case:

The Texas common points cover some 2600 stations, I think, in Texas, and represent a movement that may vary as much as 400 miles in the length of the haul, and I find that that tariff shows that from St. Louis to Texas common points, the rate on beer in glass is 48 cents per hundred pounds, with a minimum weight of 30,000 pounds, and that the same tariff gives the rate on bar iron of 55 cents, with a minimum weight of 36,000 lbs. Now, the casualty risk on beer in glass would certainly be very much higher than it would on bar iron, and yet beer in glass is hauled cheaper under that tariff, from St. Louis to Texas common points, than bar iron is hauled.

In addition to that, the beer rate provides for six thousand pounds
of free carriage of ice, sawdust, straw, etc., during the months
3243 of June, July, August and September, and in the other months, three thousand pounds. In making that rate where they carry beer in glass for less than they do bar iron, they did not consider either the lost space nor the casualty risk.

The same tariff quotes excelsior from St. Louis to Texas common points at 43 cents, with a minimum weight of 20,000 lbs., as compared with the rate already quoted of 55 cents for bar iron. They certainly did not consider the space required in the car, nor the casualty risk; excelsior would burn up very easily; bar iron, if you had a fire or wreck, would not be an entire loss at least.

The same tariff quotes potatoes. This is from St. Louis to Texas common points. The difference in every one of these hauls may exist of over four hundred miles; the tariff quotes potatoes at 54c., with minimum of 30,000 lbs. It quotes horse and mule shoes at 62c., with a minimum of 36,000 lbs. When I see tariffs actually made out on that basis, where the rate is actually less on potatoes than it is on horse and mule shoes, I know that consideration was not given to the casualty risk or the space required.

The same tariff shows poultry netting, 48c., with minimum weight of 30,000 lbs., and iron and steel chains at 70c., with minimum weight of 36,000 lbs., and when a traffic man testifies
3244 that they consider the space and the casualty risk, he is certainly not considering such items as these, and the tariffs upon which the great bulk of the business moves. Certainly no man

would claim that poultry netting required less space or that it had a less casualty risk, than iron and steel chains.

The same tariff shows hollow building tile at 25¢, minimum 40,000 lbs.: also, pig iron at 33¢ with minimum of 50,000, and the tariff itself shows that they expect to load more pig iron in the car than they do hollow building tile, and yet the rate on hollow building tile is less than it is on pig iron.

The same tariff shows iron pipe coils for refrigerating machines at 42½¢, as compared with bar iron already quoted at 55¢. The lesser rate is on the hollow and bulky stuff, and the higher rate is for the more compact stuff.

These rates apply to 2600 points in Texas from St. Louis, with a difference of over 400 miles in the possible length of the haul.

Here is sheet iron pipe up to 30 inches in diameter, quoted at 55¢, as compared with sheet iron flat at 62¢. When a tariff man testifies that they consider the weight and bulk and those things, does he imagine for a moment that they can put more sheet iron into a car when it is rolled into pipe thirty inches in diameter than they do when it is lies flat?

Here is another one: Matches, from anywhere in St. Louis
3245 to any Texas common point at 71½¢; the rate on wooden tooth picks on the same tariff is 80¢; the casualty risk on matches, it seems to me, would be higher than it would on wooden tooth picks, notwithstanding what the learned gentlemen say, who have made these rates and studied these elements and say they consider them when they can, but on the great bulk of railroad movement they don't apply them.

Here is wooden kegs, 80¢, with a minimum of 14,000 lbs., as compared with saddlery and hardware in packages, 90¢, with minimum of 30,000 lbs. The light and very bulky stuff, that is wooden kegs, is quoted lower than the heavier and compact stuff.

Here is pickles and preserves in glass 58¢ minimum of 30,000 lbs., as compared again with saddlery and hardware at 90¢. Anybody, I imagine, to use the term you used a few minutes ago, that was sane, would not imagine that pickles and preserves in glass, would take less space or be less liable to damage than hardware. And that rate is from St. Louis to 2600 points in Texas.

Here again, comparing pickles and preserves in glass at 58¢ with iron and steel chain at 70¢, with a minimum of 30,000 lbs. for pickles and preserves in glass, and 36,000 lbs. for iron and steel chain; anybody knows that pickles and preserves in glasses are fragile and the casualty risk is greater and that they do not weigh
3246 as much, and yet the rate is lower. Mr. Nay knows that, when he says that the expenses bear a direct relation to the revenue. What relation has the expense to the revenue when they haul pickles and preserves in glass at a lower rate than they haul iron and steel chain, when they may have to haul pickles and preserves in glass for 58¢ 400 miles further than they haul iron and steel chain for 70¢, I might add some questions about sanity.

Another rate on baskets, talked about a great deal in this case, the rate from St. Louis to Texas common points, is 80¢; on pig lead

it is 75¢; they may haul pig lead 400 miles less than they haul the baskets, and yet the variation in rate is 5 cents; there has been a lot of talk about baskets, and the rate taking those things into consideration; what is the consideration of a man worth that says the variation between baskets and pig lead should be only five cents, and in the tariff, the minimum on baskets is 14,000 lbs., and the minimum on pig lead is 36,000 lbs., and furthermore, under this tariff, baskets may be hauled four hundred miles further than pig lead.

Q. On the contrary, pig lead may be hauled four hundred miles further than baskets?

A. Yes, sir, in either case the revenue has no relation to the expense; here are a few samples; from St. Louis to Atlanta,
3247 Texas, those are flat rates; apples 41¢ per cwt.; this is the same tariff, No. 70, effective during the last six months of 1907—apples 41 cents, with minimum of 24,000 lbs., as compared with wire rope, 60¢ with minimum of 36,000 lbs. That is, the rate on apples is only about ⅔rds what it is on wire rope; surely, nobody would say that the casualty risk would be greater on wire rope than it would on apples, and the minimum fixed by the railroad itself shows that the density of wire rope is greater, because the minimum on apples is 24,000 lbs. and the minimum on wire rope is 36,000.

Again, beer in glass, from St. Louis to Atlanta, Texas, is 42 cents, with a minimum of 30,000 lbs. The rate on crow bars is 62 cents, with a minimum of 36,000 lbs. Certainly beer in glass has a greater casualty risk than crow bars, and it would seem to me that the density might enter into that question; they could hardly put as much weight into beer in glass as they could into crow bars, and the minimum shows they don't expect to.

Again, lamp chimneys are quoted at 61 cents, as campared with crow bars at 62; whoever made that rate certainly did not give consideration to the casualty risk; any man must know that crow bars would not be more likely to get broken than lamp chimneys.

Here are a few more rates, St. Louis to Alamo, Texas, common brick is 17½ cents, and pig iron 32½; the common brick rate carries the valuation of five dollars per thousand brick, which would indicate that the railroads themselves anticipate such a hazard
3248 of breakage and hazard of carrying brick, but they do not expect any on pig iron which is practically indestructible.

Pickles in glass, 39¢, and shot in double sacks 52¢, with minimum on pickles and glass of 24,000 and shot of 36,000 lbs.

Here is a flat rate from St. Louis to Marshall, Texas, quite a long haul. Everything the Iron Mountain hauled would come through Arkansas as I understand it; there is a flat rate of 80¢, with minimum of 14,000 lbs. on any one of the following articles, either in straight carload or in mixed carload lots: Baskets, shot, paper bags, blacking, blueing, bottles, brushes, lamp chimneys, coffee mills, crayons, galvanized iron tubs and galvanized iron pails; ink, lamps, lead, cotton mops, oil cans, oil tanks, paper, pipes—smoking pipes—ropes and twine.

Now, these are just a few samples: you can take almost any waybills of a railroad, take one waybill after another and compare it

and you will find the same conditions existing, and when gentlemen sit on the stand and say they consider casualty risk, and bulk, and all those items, I know they do theoretically, but they don't in the practical application of their rates, and it is in the face of those violent fluctuations, in one case they carry baskets and shot at the same price, and in another case, they carry lamp chimneys at less than crow bars—and that traffic fluctuates and necessarily fluctuates; when I give these examples, I am not criticizing the rates, I
3249 do not mean they are not practical and possibly the best rates possible, and that they are not compelled by competitive conditions and proper conditions too, but I do say, there can be no relation between cost and revenue when those rates exist, and it seems to me it must be apparent to anybody, and when Mr. Nay, knowing that, and being familiar with those rates, and it being his duty to check them and keep in touch with them, says you must determine your cost or how much more it costs to move state business than interstate business on the total revenue, I say he builds up a snow man which I think he knows is a snow man, and in the last few lines of his essay, he proceeds to knock him down.

This follows Mr. Bourland, Thursday morning:

3250 Q. Are those carload or less than carload?

A. Those are all carload rates, on which, of course, the bulk of the company's business is handled. That is, I mean to say that the bulk of the company's business is handled in carload lots.

Q. You have been talking about Texas common point rates?

A. I first used the Texas common points and then I have given some specific illustrations of special points in Texas, illustrating in a general sense the trans-state movements in the state of Arkansas.

Q. What is the tariff that you have been reading from, Mr. Ludlam?

A. The St. Louis Iron Mountain & Southern, No. 70, issued by G. W. Cole, Agent; in effect during the last six months of 1907. It is known as "Texas Tariff 1-D. D."

Q. Does the ton mile theory of division of expense take into consideration the density, value, weight, liability to injuries—that is, casualty risk, and those elements mentioned in the statement you have just made?

A. In my judgment, to a far greater extent than the revenue, because the basis of the ton mile consists of two factors, first, the weight of the freight, and second, the distance which it is hauled; and the revenue as shown by this one tariff, if you want only one illustration, does not take into consideration at all the distance which the
3251 freight is carried, because, under this tariff, freight can move distances varying over 400 miles in the aggregate.

Q. If that is correct, that those rates apply to distances of 400 miles, it would follow, would it not, that those rates might be higher on the side of the zone that was nearest the point at which the shipment originated, than on the farther side, more remote, and also that the reasonableness of the rate with reference to the length of the haul might be more at the intermediate points with reference to dis-

tance, more closely adapted to the length of haul than at the extreme points that I have referred to.

A. The shorter the haul the greater the revenue would be per ton per mile. I do not question in any sense the reasonableness of the rate. I am simply stating that there is a variation.

Q. Now, referring to the ton mile as a unit, assume that you have a revenue divided between the total tons hauled, of five mills per mile. The length of haul of some of the commodities may be 25 miles and the length of haul of others may be 1000 miles:

In what way can you say that the ton mile theory has any reference to the length of the haul in that case?

A. Because the ton mile is predicated absolutely on the
3252 weight of the shipment and the length of the haul. Whether it be baskests or crow bars or lamp chimneys or beer in glass,it actually costs more to haul it 1100 miles than it does to haul it 700 miles. The ton mile basis takes that feature into consideration. The revenue basis as shown very forcibly by this one tariff I have referred to, does not take that into consideration.

Q. Does the ton mile basis take the casualty risk of the commodities into consideration?

A. No, sir, and the casualty risk on the St. Louis, Iron Mountain and Southern amounts to about three per cent of the total freight operating expenses.

I might say in that connection—referring back to some of the testimony that has been given by traffic men in this case—that they have nearly all stated that the casualty risk is considered—in fact, one gentleman stated that the casualty risk was the most important element considered in rate making—it must be apparent on its face to a person who stops and gives the matter consideration, that any man who understood his business, would not make an item which only represented three per cent of the total freight expenses of a company, the prime factor in fixing the revenue to be derived by that company. It cannot be so. It is illogical.

Q. What percentage of the business of the Iron Mountain road moved under that tariff that you have been reading from?

A. I have not figured that out, Mr. Moore. I cannot tell you, but certainly a very large volume of it.

3253 Q. You simply assume that as an inference, rather than state it as the result of any information or knowledge you have?

A. No, sir, I said that from general knowledge that there would be a large amount of freight moving from St. Louis to Texas common points.

Q. Would you say 15%, 50%, 10% or 75%?

A. Of what?

Q. Of the business of the Iron Mountain that moves under that tariff.

A. I would not want to make an estimate. I would not attempt to do it.

Q. It would be impossible for you to make an estimate that you

could rely upon, without any more information than you have, would it not, Mr. Ludlam?

A. It would be only an opinion.

Q. If coal and lumber is 50% of the total business of that road, the items that you refer to would be rather a small per cent, would they not?

A. Yes, sir, but if relatively the same difference existed in the coal and lumber rate, that exists in the commodities shown by this tariff, it would not in any way affect the illustration?

Q. You assume, then, that the ton mile theory upon whicth you have proceeded, does take into consideration those elements which you say are not considered in fixing the rates that you have called attention to in the tariff which you have read?

3254 A. I say the ton mile theory takes into consideration the two most essential elements, the weight of the commodity moving and the distance that it moved.

Q. Now, tell me how can you state that an average ton mile rate applied to the total volume—not to those items alone to which you refer, but to the total volume of the business of the railroad—can take into consideration the difference in the weight of a carload of feathers or a carload of lead or iron?

You put it all at five mills, we will say, per ton per mile: how does that involve in any way or give any consideration whatever to the difference in weight in those commodities to which I have called your attention?

A. As between state and interstate it makes no difference because the carload of feathers is as apt to move as frequently in state business as in interstate business; or a carload of coal is as apt to move in state business as frequently as in interstate business.

So far as taking the ton mile as a whole and considering it in that connection, I would say that it does not make specific allowance for the difference between the carload of feathers and the carload of iron. But on the average those things equalize themselves.

Q. How does it do that in specific cases? You say it does not do it generally, how does it do it in specific cases?

3255 A. I said it did not do it in specific cases, but it did do it generally.

Q. How can it do that? Generalities are made up of details.

A. Yes, sir, because on the average they will move so much light freight and so much heavy freight.

Q. The total movement represents varying lengths of haul, from the shortest to the longest haul that is carried by a railroad?

A. That is absolutely accounted for in the ton mile.

Q. Explain to me how you account for it in the ton mile when you get the aggregate of the miles and multiply it by the tons?

I believe that is the way you arrive at the ton mile basis. How can it take into consideration the length of the haul?

A. Because the ton mile is made up of the weight of the shipment and the miles that that shipment moves. It takes into consideration absolutely the miles made.

Q. On the Cotton Belt road, it takes five states shipments to make

the average haul of an interstate shipment as shown by the statistics in this case:

How is it possible to say that the ton mile theory takes into consideration that difference as between the state and interstate average haul?

3256 A. The flat ton mile would not take that into consideration and I have never prepared any figures, either in this case or in the Missouri case, that did not make allowance for that difference. Necessarily those allowances are shown by——

Q. Tell me where you have made allowances in the exhibit you have filed in this case for the difference in the state haul and the interstate haul as shown in these statistics?

A. In our apportionment of the expenses to the local and through trains and also in our apportionment of the station expenses.

Q. Point out an instance now, please?

A. In our apportionment of the "Maintenance of way and structure expenses" we have added 50% to engine miles made by trains, attaching to local trains for station switching; and that same principle of attempting to allocate special expenses applicable to the local trains, where there is such special expense, is carried throughout our exhibits.

Q. You have covered the difference in the average length of haul where the interstate is five times as great as the state, by an allowance of 50%?

A. The allowance of 50% in this particular case to the local train and then the apportionment to the local train of the state business handled by the local train would fully take care of it, in our judgment.

3257 Q. Where did you get that factor of 50%?

A. That is purely arbitrary. We think that it is excessive.

Q. Why did you adopt it if you think it is excessive?

A. We wanted to be fair in stating the maximum cost of the state business.

Q. Fair rather than accurate, do you mean?

A. Where we could not be exactly accurate, where the exact amount could not be definitely determined, we tried to be liberal.

Q. How many movements of state freight in view of the difference of the length of haul between state and interstate, would it require to make the equivalent of an interstate haul, with reference to the handling of the commodities moved on the state and interstate haul?

A. It would take about three movements of state freight on the St. Louis Iron Mountain & Southern to equal in distance the ton mile of the interstate.

Q. How would it be on the Cotton Belt?

A. It would take about five on the Cotton Belt.

Q. You applied the 50% allowance to both roads alike, did you not?

A. To determine the cost of the local trains we have applied the same percentages. Of course, the use of the local trains is predicated on the actual service they have performed.

3258 Q. After you ascertained the difference in the expense of operating local and through trains and obtained the tonnage, etc., you applied then the ton mile theory for the purpose of dividing the cost as between state and interstate freight?

A. We divided the expenses of the local trains on the volume of business handled by the local trains, which was determined by the ton miles, and the expense of the through trains were apportioned on the same basis. In other words, the expense of the two classes of trains were divided on the basis of the business which they did.

Q. And the basis of the entire division, when you get it down to its ultimate result, as between state and interstate, is that 50% allowance you made on the basis of extra switching?

A. No, that is only one element.

Q. What other allowance did you make there, speaking of maintenance of way and structures?

A. Maintenance of way and structures——

Q. That is what we are speaking about.

A. I assumed you were speaking of the total expenses of the local train.

So far as the apportionment of the "Maintenance of way and structure expense" is concerned, between the local and through trains, the only actual allowance made was to add 50% to the local engine miles for station switching.

3259 Q. Mr. Ludlam, if that is fair to the Iron Mountain, would you say that is also fair to the Cotton Belt, in view of the difference of length of haul on those two lines?

A. In our judgment, it is entirely fair to determine the cost of the two classes of trains, and in the apportionment of expense of those two trains, subsequently made, we take care of the question of whether the haul of state business was greater or less on the Cotton Belt as compared with the Iron Mountain.

Q. The object was to ultimately ascertain the difference of expense of moving state and interstate traffic?

A. Yes, sir.

Q. So the division you made on the ton mile basis, between state and interstate traffic, is based upon the differences that enter into the cost of operating local and through trains: that is true, is it not?

A. No, sir, not the expense of the state and interstate. That is the result, not the distribution.

Q. Well, we will speak of it as the result if you prefer that term: the method that you have adopted for distributing the expenses between those two classes of traffic, is it not all based, and is not the foundation of it, the differences you make between the expense of operating local and through trains?

A. The foundation of it is the basis of the cost of the two classes of service.

3260 Q. You disregarded in that one instance—using that to illustrate, I shall not go more into detail—any respect of the length of haul that is shown in the evidence in this case to exist between the Iron Mountain and Cotton Belt, did you not?

A. No, sir, that is one of the especial elements taken into con-

sideration of distributing the two elements of cost and of the two classes of trains, after they are determined.

Q. Now, to go back to the cost of operation, as a stable factor, which you say is the case——

A. May I say there, that I said stable as between state and interstate; a fluctuation in the cost of material or a fluctuation in the wages of employés would apply equally to state or interstate.

Q. Will not a fluctuation in the rates apply to state and interstate if it is true, as stated by many witnesses on the stand, that there is a relation between state and interstate rates?

I am not asking you now what you think about relation, but if it is true, would not the same statement apply to that also?

A. If there was a constant and stable relation between the state and interstate rates that would be true. I mean true as to some basis of apportionment, not necessarily an apportionment on the revenue basis, because even if the rates and the relation were
3261 stable, the relation of expense to revenue might still be entirely out of proportion between the state and the interstate.

Q. You criticize a statement made by Mr. McPherson on the stand (Page 351, Vol. 1), where he said:

"The revenue, therefore, expresses volume, character, risk and distance, rather than quantity."

Is it not true that Mr. McPherson in making that statement was comparing the fact that revenue as a unit of division expresses those matters that he enumerated—value, character, risk and distance, rather than quantity; in comparing it with that unit with the ton mile as a unit and for the purpose of distinguishing between a unit which would take all those matters into consideration, and one which considered alone the matter of quantity, as he assumed the ton mile theory?

Don't you know that it was in that sense that he made that comparison?

A. I think he made that comparison in relation to the ton mile, but I think that the statement that quantity was not considered in making rates to the same extent that those other items are, is entirely misleading, and particularly when he stated that the "revenue, therefore, expresses value, character, risk and distance;" how does the revenue in this tariff I have referred to, as an illustration, represent the risk when it quotes beer in glass at 48¢ and bar iron at 55¢, and how does it consider distance when one of those shipments may move 400 miles further than another shipment of the
3262 same commodity and same weight and same class.

Q. That is not answering the question I asked you, Mr. Ludlam.

I asked you in connection with your statement by way of criticism of that statement of Mr. McPherson, that you never heard of a railroad rate that did not consider quantity, if upon examining that you would not find that when Mr. McPherson made that statement he did not mean to say that the revenue did not consider quantity, but did not confine it to that to the exclusion of those other elements as in his view the ton mile theory did.

A. I would not attempt to say what Mr. McPherson meant to say.

Q. To his statement that it costs more to transport commodities in small quantities than in large quantities, you said that you were unable to understand what he meant in making that statement:

Is it not obvious that what he meant was that it cost less, if you want to put it that way, per ton or per mile, or any other way you might measure the relation of cost—it costs less to transport commodities in large volume than it would in small volume?

Was not that what he meant and is not that obvious from his statement, and is it not true?

A. It was not obvious to me and that was the attention I attemped to call in my answer to his testimony; first, that he
3263 considered a great many other elements before he did quantity, and yet, not considering quantity, he goes on to state that it costs more to transport commodities in small quantities than it does in larger quantities.

It seemed to me his testimony was contradictory.

Q. Is not that true and is it not in accordance with the universal rule, that a large volume of business transacted on the wholesale system can be conducted more cheaply with reference to the unit than a small retail business?

A. I think it is, yes, sir.

Q. Do you not understand that that is the sense in which Mr. McPherson in using his statement was speaking——

A. I think it might be interpreted that way, but that was not the way I read it.

Q. Without meaning that there is any intentional unfairness, is it not a fact that your criticism was rather unfair to his testimony?

A. I did not mean to have it so. I meant to draw attention to the fact that in my judgment, he attempted to belittle the relative importance of the quantity in supporting the revenue theory and then he immediately contradicted himself.

I agree with Mr. McPherson entirely, if it was his intention to state that commodities can be handled in large quantities at less expense per unit than they can in small quantities, but I
3264 don't agree with him that the revenue therefore, expresses value, character, risk and distance, rather than quantity.

Q. Referring to a statement you made that in a general way the records kept by the railroads of the average cost of moving tonnage, would give an idea roughly of the average cost of moving freight on the line of the road:

I want to ask you if similar records to those that are kept with reference to the ton per mile on freight on commodities are also kept with reference to the character of the passenger?

A. The railroad companies keep records as to the revenue per ton per mile and as to the revenue per passenger per mile.

Q. In making up the exhibits filed by Mr. Wharton in this case, have you taken into account or made any allowance for the difference in the loading of cars?

A. In what way, Mr. Moore?

Q. The statistics in this case show that on one of these roads the

average loading of loaded cars in local trains is 14.7 tons and on through trains it is 19.2 tons; that is on the Iron Mountain.

On the Cotton Belt it is 12.43 on the local trains and 17.29 on the through trains:

Have you made any allowance in your division of train expenses for that difference?

A. Yes, sir.

3265 Q. In what way?

A. In having determined as accurately as possible the cost of the two classes of trains and then apportion that cost between the business that they actually handle.

Q. How did you determine that cost as between trains?

A. That is explained fully in our exhibit——

Q. It is on the car mile basis, is it not?

A. No, sir.

Q. Take "Maintenance of equipment" or "Maintenance of Way:" is it not on the car mile or engine reduced to car mileage?

A. Certain items are on the car mile basis.

Q. Take "Maintenance of way and structures"?

A. That is on the car mile basis with the allowance as stated.

Q. Take "Maintenance of locomotives"?

A. That is on the car mile basis.

Q. How about freight cars?

A. That is on the car mile basis with certain allowances.

Q. Have you made any allowance there for this difference in loading between local and through trains, the cars in local and through trains?

A. Yes, sir, because we have apportioned the expense of the local trains to the cars that the local trains actually handled.

3266 Q. I understand that, but you seem to have apportioned it on a basis of the car miles, and the car miles, as I understand it, do not involve the contents of the car and the weight of the load carried by the car; where is that taken into consideration in your division?

A. In the distribution of the expenses of the local train and the through train as actually determined over the contents of the cars the train carried.

Q. Have you determined it as between the local and through trains; have you considered the difference in your division of train expenses as between the local and through trains?

A. Yes, having ascertained the cost of the local train we think that takes in all the elements entering into the local train.

Q. How does it take in the element of weight when you determine it on the car miles, without regard to the contents of the car?

A. The statistics that we gave at the start showing that the average loading of revenue freight was different in the local trains from the loading of the through trains show that that was taken into consideration.

Q. I understand it is shown in your statistics, and that is where I got the figures: but what I am asking you is to point out to me where you take into consideration in dividing the train expense be-

tween local and through trains—I mean the contents, I am
3267 not talking of the car or car miles—where did you give consideration in your formulas to the weight of the contents of the cars that make up the two classes of trains?

If it is there I want you to point it out; that is what I have been trying to ascertain.

A. Division No. 7 of Exhibit K, page 7, explains how the division was made between the two classes of trains, after the expense of the two classes of trains had been determined, as previously explained in this exhibit. That division was made on the basis of the freight actually handled by the two classes of trains during the month of October, 1907, in the case of the Iron Mountain.

Q. Now, Mr. Ludlam, you have divided the train expense—except two or three items, such as traffic expenses, station expenses, and perhaps one other—on the basis of car miles:

In this method of dividing train costs as between state and interstate ton miles, you simply ascertained what per cent of the total ton mileage of intrastate business is carried on local trains and what per cent of the total interstate business is carried on local trains.

Then you determine what per cent of the intrastate and interstate business, respectively, is carried on the through trains.

Tell me, do you make any distinction in that apportionment or in arriving at the per cents of state and interstate business
3268 carried on those trains? Do you do it in any way with reference to the loading of the cars that make up those two classes of trains?

A. Necessarily the ton miles include that element.

Q. I want to ask you if the 39.10 per cent of intrastate business carried on local trains is not a statement in the aggregate and without any reference whatever to the loading or contents of the cars in which this traffic is carried.

A. 39.10 per cent relates to the proportion of the total freight handled by local trains which are state business and it assumes—and I think this is what you mean to ask—that the cars handled by the local trains, whether they be state or interstate, were equally loaded.

That is to say, if the local train carried, we will say two car loads of stone, one going across the borders of the State and the other stopping within the State, that they were both loaded to the same capacity.

Q. It assumes that?

A. Yes, sir.

Q. Whether on local or through trains?

A. It assumes that on each class of train.

Q. Whether through train or local train.

Now, if it is a fact that the cars in the through train are loaded more heavily than the cars in the local train, do you not in
3269 that apportionment disregard that distinction?

A. No, sir, it does not affect the difference between the loading of the cars in the through train and the loading of the cars in the local train, but if there was a distinction between the loading

of the state cars in the local train and the interstate cars in the local train, and a difference between the loading of the state cars in the through train, and the interstate cars in the through train, it would ignore that difference, but it would not ignore the difference between the loading of the cars in the local train and the loading of the cars in the through train.

Q. Can you give me, when we assemble after recess, the cost per ton per mile of state and interstate freight as shown by the exhibits filed in this case by Mr. Wharton?

A. I will look and see if we have that worked up, Mr.
3270 Moore.

Q. If there are ten cars in a local train and ten cars in a through train, under your method of division—car mileage—the total expense would be divided equally without regard to the contents of these cars, between the local and through trains, would they not?

A. The ten cars carried on the through train would be applied to the through train, and the ten cars carried on the local train would be applied to the local train, our division of expense being made between the cost of the local train and the cost of the through train. That would not be applied to the whole factor, as your question would imply.

Q. But the total expense of those two trains, in your method of division, would be divided equally between the two, would they not?

A. No, sir. The total expense of each class of trains is divided over the business handled by each class of train.

Q. I am not speaking about the business, but the division of train expense to local and through trains:

If you have two trains and one of them is a local train and one of them is a through train, each one containing ten cars, would not the total train expense as between those cars, under your
3271 method of division, be divided between them on the basis of the number of cars in each train?

A. Certainly, the expenses are apportioned on car mileage basis.

Q. I mean those expenses that are apportioned on a car mile basis: would that not be the case?

A. No, sir, because we make certain allowances for the car mileage made on local trains.

Q. I understand that, but after you have made your allowance and in that way obtained the number of car miles then you would divide the expense in proportion to the number of car miles in each train, would you not?

A. With what we allow to equalize.

Q. On the first sheet of Exhibit K, the total number of car miles is 8,470,636; of that 1,438,038 car miles is for the local and 7,032,-598 car miles for the through trains:

You have obtained the per cents of the car mileage on each class of trains with reference to the total car mileage and apportioned the expense on that basis, have you not?

A. After adding 50 per cent to the engine mileage of local trains to provide for the switching.

Q. Does that not apply to both state and interstate freight on the local train?

3272 A. Oh, yes, the local train carries both state and interstate.

Q. Now, for the present purpose we will eliminate that and we will assume that you make the allowance; what I want to get at is, after making that allowance that you spoke of, how have you divided the total mileage between local and through trains, as you have stated?

A. On a car mileage basis.

Q. Then you divide the expense of maintenance of way and structures on the ratio of the car mileage in each class of train to the total car mileage: is that correct?

A. Yes, after making specific allowance for station switching of local trains.

Q. And that is done, is it not, without regard to what the contents of the car may be, or whether some of them or all of them are empty, or some empty and some loaded?

A. Yes, sir.

Q. We will say then that on one of those trains—to illustrate I will take a local train—five of the cars contain ten tons each of state freight and five of them contain twenty tons each of interstate freight:

That is one hundred and fifty tons, of which fifty tons are state freight carried on five of the cars, and one hundred tons are interstate freight carried on five cars:

When you come to apply your ton mile theory of division

3273 to that, how do you apportion that expense?

A. The ton mile theory of division to the total expense of the local——

Q. Of that train, yes. I have described the train: now apply your division of the expense on the ton mile basis, telling what per cent you would apply to the state business and what proportion you would apply to the interstate business.

A. Assuming that the local train had fifty ton miles of state freight, and one hundred ton miles of interstate freight, we would apportion one third of the cost of the local train to the state business and two thirds of the cost to the interstate business.

Q. You would do it on the ratio that each ton of freight on the train bore to the total tonnage of the train, would you not?

A. Total ton miles, yes, sir.

Q. Mr. Ludlam, in that case now you are charging to the interstate freight on the five cars two thirds of the train expenses, are you not?

A. On the basis of the case that you mentioned.

Q. In other words, you depart from your car mile theory there—you have ascertained the train expense on the basis of the car miles—you depart from that and you distribute that expense

3274 as between state and interstate business on the ton mile basis, thereby charging the greater part of the expense to the interstate freights carried on that train: that is the case, is it not?

A. We do not depart from it in our exhibit. We depart from it in the hypothesis which you suggested.

Q. Do you not do it in your exhibit?

A. No, sir. Our exhibit does not show anywhere that on the——

Q. If that should happen to be the relation of the loading as between the state and the interstate tonnage carried on the local trains, it would result in that in your exhibit, would it not?

A. If that should happen to be, yes sir.

Q. Does it not follow, Mr. Ludlam, that these train expenses are divided, the state and interstate business, without regard to the loading of the cars?

A. No, sir, because it is divided on the actual ton mileage of the two classes of freight. If you assume that it takes two cars to carry the same ton miles of state freight that one car can carry of interstate freight, then that would be the case, but we make no such assumption.

Q. Does your exhibit in division 7, your method of dividing train expenses, assume that each car carries the same load?

A. That each car on the local train carries the same load and that each car on the through train carries the same
3275 load.

Q. You say in explanation of your method of dividing train costs, that during the month of October, 1907, 39.10 percent of all the intrastate ton miles, and 8.70 percent of all interstate ton miles of freight were handled on local trains—that is shown on page 7 of Exhibit K:

When you get down to the division you charge to the intrastate business 39.10 percent of the ton miles, do you not, of all local business?

A. Yes, of the business handled by local train.

Q. That is what I mean. And you charge to interstate business the corresponding percent that I mentioned above, 8.70 percent?

A. Yes, 8.70 percent.

Q. You assume in that that the cars in the local train all have the same loading, do you?

A. We assume in that that the cars of state freight and the cars of interstate freight handled by the local train are equally loaded.

Q. Is it not a fact that the interstate loading is heavier than the state loading?

A. I should say that the loading of the cars on the local train would be the same whether the freight was state or interstate.

In the case in Missouri, in a test that we made extending
3276 over quite a period of time, Missouri Pacific, we found that the state freight cars were considerably more heavily loaded than the interstate cars.

Q. I know you did, but didn't that grow out of the fact that there was a very large movement of stone in local trains from nearby points into the City of St. Louis?

A. My recollection is that it grew out of that.

Q. Didn't that cover a short period?

A. That does cover a short period.

Q. I wish you would think a moment, because I am informed that that is the case; refresh your memory and see if it did not grow out of the circumstances to which I have called your attention, that is, that there was a heavy shipment of stone from nearby points into this City.

A. No, sir, I do not recall that it did. In fact, I do not recall that we analyzed freight to see what it did grow out of.

We simply took the freight as shown by the way bills and found that over a certain period of loading the cars used for state business was considerably heavier, as I recall it, about 20 percent heavier, than the cars handling interstate.

Q. The same basis of distribution is adopted as between state and interstate business, that is carried on through trains, is it not, Mr. Ludlam?

3277 A. Yes, the same basis.

Q. Is it not true that these railroads run package cars at stated times, two or three times, or once a week, from St. Louis to points in Texas, and that those cars go out loaded to their capacity?

A. I cannot say in this case, but our examination of the through cars on the Missouri Pacific of package freight, showed that they went out loaded very lightly; an average examination covering several days showed that those through cars of package freight carried on an average of six tons, very light, as I recall it.

Q. I am speaking, of course, in my reference to package, to less than car load freight.

A. Oh, yes.

Q. Did you answer with reference to that, Mr. Ludlam?

A. Yes, sir.

Q. Is not six tons heavy load for less than car load, is it not above the average that you have used?

A. Exhibit "I" shows that the average loading of revenue freight, considering all cars during the month of October, 1907, on the St. Louis, Iron Mountain & Southern Railway, in Arkansas, amounted to 16.1 tons on the through trains which carried these through cars of package freight.

Q. Is that car load or less than car load?

A. That is everything carried on the through train. That

3278 would include these package cars that you speak of, which would tend to reduce the average. The average would naturally be higher if those lighter cars were not included.

Q. What percent of it is less than car load, four percent is it not, four or four and one half percent?

A. 3.81 percent of the total ton miles handled by through trains is less than car load.

Q. How is it on the Cotton Belt? Have you that before you?

A. Yes, the less than car load ton miles handled by the through train amounted to 7.55 percent of the total ton miles handled by through trains.

Q. What is the average loading of through trains?

A. The average loading of revenue freight, considering all cars

on the St. Louis Southwestern Railway in the month of October, 1908 was 12.33 tons.

Q. Mr. Ludlam, are you familiar with the manner of distributing local or intrastate freight in the State of Arkansas, that which is carried on these through trains?

A. Not specifically in the State of Arkansas, and I should say only in a general way, as that class of freight is generally handled by railroads.

Q. Is not that class of freight carried on local trains distributed in a different manner from interstate freight carried on
3279 them?

In other words, a local train will start out on a run of seventy five miles, we will say, and maybe there are eight stations: Will not the state freight under the conditions which generally exist, begin to be distributed and peddled and loaded out of that train earlier?

In other words, is not that likely to be delivered at more stations and to be distributed in a way that will cause a greater reduction of the weight of the state freight than in the interstate freight, as the train moves along?

A. No, sir, I think not. The less than car load freight, both state and interstate, is handled by the same train and frequently in the same car. It is distributed along from station to station according to the points to which it is consigned, and I think that many of those less than car load lots are distributed equally with the state less than car load lots.

What I mean to say is, people buying at a distance are more apt to buy in small quantities than when they are buying at nearby places. A man living in Arkansas will send to New York for some specific commodity he may happen to want, and have it shipped to him by freight to some point in Arkansas; whereas, when he buys at a home market he is apt to buy in larger quantities.

3280 Q. Is there not more local retail purchasing in the country done at nearby, small trade centers like we have in Arkansas, than there is at farther off, large distributing centers, like St. Louis and New York?

A. Yes, I think there is.

Q. Would not that have a tendency to cause a more even distribution of local freights between all stations on the run of the local trains than there would be of interstate freight?

A. No, because in my judgment the amount of less than car load freight purchased at all the outside points would be far greater than that purchased at the distributing points within Arkansas. What I mean to say is, when you not only consider New York, but Chicago and St. Louis, and all the other points—for instance, the statistics show that (Exhibit 26) of all the freight handled by the St. Louis, Iron Mountain & Southern Railway in October, 1907, the trans-state less than car load amounted to 2.04 percent of the total ton miles and that the interstate less than car load amounted to 1.87 percent of the total ton miles; where as the state less than car load amounted to .38 percent of the total ton miles.

Q. Did not those percents very largely grow out of the relative volume of business between state and interstate?

3281 A. Somewhat; but if you reduce it to the actual number of tons, it shows that during the month of October there were 8,482 tons of trans-state, less-than-carload freight; that there were 20,573 tons of interstate, less-than-carload freight, and that there were only 8,031 tons of state, less-than-carload freight; that is to say, if you apply it only to the number of tons.

Q. Have you there what proportion of that interstate less-than-carload freight moved on through trains and what on local trains?

A. No, sir. In our statistics we assumed that all of the state less-than-carload freight moved on local trains.

Q. Have you any information as to the interstate, what proportion of that moved on local trains?

A. No, sir.

Q. Now, if your assumption that the loading of the cars is different, if the same should be correct, then would your basis of distribution on the ton mile be proper?

A. Our basis of distribution is not on the ton mile; it is based on the local and through trains.

If your assumption that the loading of the state freight carried on the local train was different from the loading of the interstate freight carried on the local train, and your further assumption that

3282 the loading of the state freight carried on through trains and the loading of the interstate freight carried on the through trains, was not the same, was correct, our figures would be changed to that extent.

Q. Are those assumptions or have you facts upon which you acted? Have you knowledge and information that your assumption is correct, or is it merely an assumption?

A. I don't think we worked out any statistics to prove that, but there is no doubt in my mind but what that is the fact.

Q. It is in evidence in this case that there is a pretty heavy loss of time of the cars by the difference of the methods of operating local trains in the transportation of the business that is handled on them: Did you take that into consideration in making your division between through and local trains, the loss of time by the cars in the local trains?

A. Yes, we made specific allowance for switching and the other elements that go to make up that loss of time.

Q. Did you make any other allowances than those that you referred to, switching and things of that kind?

A. Nothing other than that which is shown in our report.

Q. Mr. McPherson states in his testimony in this case, at page 353, volume 1, as follows:

"The railway secures less efficiency from its cars used in

3283 intrastate freight traffic, in proportion to the relative tonnage, than in the interstate freight traffic; a greater investment in cars is necessary, and there is a larger cost for maintenance of cars in intrastate traffic than in interstate traffic, in proportion to the respective tonnage."

Was that element of difference between the two kinds of traffic taken into consideration in the preparation of your exhibits?

A. Yes, in the proportion to which those elements to which he refers would refer to the local trains and to the through trains.

Q. You made no other provision for it except that that is referred to as the allowance of which you spoke, switching allowance?

A. Switching and other allowances.

Q. What other allowances have you made?

A. They are shown in our report; allowances for extra stops of cars in local trains. On page 1, under (*a*) "Locomotives" we make an allowance for the extra maintenance expense of locomotives due to the service in the yard.

We also make an allowance for the switching done by road locomotives on local trains ,and also an allowance for extra maintenance on account of the switching which they do.

Under (*b*) repairs of freight cars, we make an extra allowance for the maintenance of freight cars, due to more stopping and starting of cars of local trains than cars of through trains, and also an extra allowance for the terminal handling.

3284 Those allowances having been made and apportioned to the local trains, all items of a supervisory and general character which are apportioned on the basis of the direct expenses, are similarly affected.

Reverting to Mr. McPherson's testimony: he says that the railway secures less efficiency from its cars used in intrastate freight traffic in proportion to the relative tonnage, than in the interstate freight traffic:

Inasmuch as we have apportioned the state traffic and the interstate traffic to the local and through trains in the proportion in which it was handled, that extra expense, if there is one, is provided for.

Q. Now, Mr. Ludlam, referring to your detail statement: does not the first item you mention "locomotives" apply to the use of locomotives and not to cars; and the second, under the item of "Freight Cars" does not that apply rather to the wear and tear caused by stopping and starting at stations, rather than the loss to the use of the cars

A. But the loss of the use of the cars, as I understand it, comes from the fact that the cars are in the local trains rather than in the through trains.

Q. What I have in mind and what was in Mr. McPherson's mind in the statement he made, as shown by the evidence of himself and others, is that owing to the schedules on which local trains are

3285 running and the fact that they only work in daylight, and considerations of that sort, there is a much greater loss in the efficiency and use of the cars than there is in the cars used in the through trains.

It is that kind of loss that I have in mind and what I referred to when I asked you if you made any allowance in these formulas on that account?

A. We have made allowance for the maintenance of the equip-

ment. If there is a loss in the time of the equipment that should be apportioned on the investment, or the proportion of the property of the company that is represented by its equipment, there would not be any allowance made for that unless you apportioned the property on the cost basis instead of the revenue basis; unless it is conceded that the revenue basis makes an allowance for the extra investment required in local equipment or in equipment for the short haul business, as pointed out by Mr. McPherson.

The question of interest on the investment would not enter into the operating expenses, but into the distribution of the property, and if you distributed the property, as I told Judge Hill yesterday, on a cost basis, that would be provided for. On a revenue basis it is not provided for unless the revenue provides for that lost motion.

Q. Is it provided for in your formula? It is not provided for in any specific way in your formulas?

3286 A. No, it is not an operating expense; it is an interest on the investment.

Q. I am speaking now of the efficiency of the cars: I do not mean the loss and wearing out, but the efficiency of the cars in use?

A. The efficiency of the cars is represented by the maintenance and operating expense, and in my judgment, is fully provided for by our formula as worked out in our exhibits. The investment loss is not provided for unless the distribution of property on a revenue basis takes care of that, and that is a matter of opinion; but if the property was distributed on a cost basis, then it would be provided for, in my judgment.

Q. You have stated since you have been on the stand, that it is a well recognized accounting principle that you arrive at the most correct results obtainable by apportioning indirect expenses which cannot be specifically allocated in the ratio of direct expenses which can be specifically allocated:

Now, if that proposition is correct, and I do not doubt it, why does it not apply to the 90 per cent of expense of "Maintenance of Way and Structures" which is attributable to the elements and not to any use made of the tracks, buildings, fences, etc., by the engines and cars?

A. I don't think that is relative at all. I think that is an

3287 expense the total of which can be specifically apportioned to the operation of the trains. I would not call that an indirect expense in any sense. I think that is a direct expense absolutely applicable to the operation of the train.

Q. Is not the damage by the elements an indirect expense, as much so as "supervision and general expense"?

A. No, sir; I don't think so.

Q. Are they not all pretty largely the same character, not attributable to any particular part of operation, but to other causes?

A. No, sir; I don't think so.

If a tie rots from the weather and has to be taken out and a new tie put in the track, it is put in the track for the specific use of that track. But you cannot apportion the superintendent's salary, if you please, or the president's salary, to any specific ties, because it

applies to all ties and all items of expense. The tie I referred to applies specifically to the running of trains.

Q. Superintendents and their assistants are just as essential to the operation of a railroad as any other element connected with it, are they not?

A. Yes, sir.

Q. Why is the expense charged on that account any more an indirect charge than that expense growing out of depreciation that is not produced by the running of trains, but is produced by natural causes from the elements?

3288 A. So far as the superintendence of maintenance of way and structures applies, that is all apportioned to the "Maintenance of Way and Structures" because the time of the superintendent is entirely given to them, but in the case, for instance, of the "Supervision and General" expense of the maintenance of equipment, you cannot say whether his expense is applicable to repairs of locomotives; repairs of freight cars; renewals of freight cars; or repairs of work equipment or renewal of work equipment. Items of that nature you cannot specifically locate as applicable to the specific items, and therefore it is distributed over all of the items in proportion that the items that you can locate, amount to.

Q. You cannot say that the deterioration resulting to structures, fences, telegraph poles and to the roadbed itself, from the elements, is chargeable to either state or interstate freight, can you: To the movement of interstate freight, I mean, or to the movement of intrastate freight?

A. No, sir; we don't attempt to.

Q. I know you do not.

Is it not an expense brought about by unavoidable causes, which ought to be met by the general revenues rather than by charging it to any feature or branch of operation, unless it was brought about or charged by that branch of operation?

A. No, sir; I would not say so. I would say that your total maintenance of way and structures should be charged to the

3289 purpose for which your way and structures are maintained.

It is not the question of what causes the expense that determines whether it is direct or indirect. It is a question of whether you can allocate that expense to a specific purpose.

To revert to the tie again, it is not a question of whether a tie is worn out by the trains running over it or by the elements. It is there for a specific purpose and therefore it should be charged to the specific purpose to which its use applies.

However, in the case of the salary of the superintendent of maintenance of equipment, he is there to give his attention, as stated, either to repairs of locomotives, repairs of freight cars, or repairs of work equipment.

Q. Is not a station just as essential to the transportation of freights and their handling and distribution, as the right of way is to the movement of the train?

A. Are you referring to the station building or station expenses?

Q. Station expenses.

A. Station expenses are applicable to the movement of freight, yes, sir.

Q. You do not apply that on the same basis that you do other transportation expenses, do you?

A. No, sir; because we think that the station expense
3290 is more specifically applicable to the freight originating and terminating at the station to which the expense applies.

Q. Speaking of "station expenses," Mr. Ludlam, you have charged that to all classes of freight without any regard to the service that may be rendered to that part of the traffic which we denominated as "trans-state:"

That consists of the services of agents, clerks, cashiers, stenographers, and employés for handling freight about the station house, as I undertand:

Why should any part of that be charged to trans-state traffic?

A. Why should any part of the station expenses——

Q. Which consist of such services as I have enumerated, as I understand it: why should any part of that be charged to the trans-state business?

I am distinguishing that from "terminal" expense. I am speaking of "station" expenses, as distinguished from "terminal" expenses.

A. We have assumed in that division that all of the interstate freight, both trans-state and what might be designated as second-class interstate, on the average uses one terminal in the state of Arkansas, as compared with the state freight using two terminals.

Of course there is some trans-state freight—since you refer specifically to that—into and out of Memphis, that would really have a terminal expense.

3291 There is also a large amount of interstate—what you might call second-class interstate—in and out of Memphis and Fort Smith, that would have two terminal expenses in the state.

There is also, as I understand the testimony in this case, a large amount of grain, lumber and cotton, that would have two or more terminal handlings in the state.

And there is a large amount of the straight trans-state freight that would be received from and delivered to connections in the state, to which there would attach a considerable expense.

So we think, that taking all those things into consideration, a fair apportionment would be to assume that all interstate traffic, on the average, *have* one terminal, that is, one station expense, and that all state traffic has two station expenses. That is an assumption.

Q. Now, there is a very large volume—and that is recognized in the statistics in this case—of the business of these roads, that consists of trans-state traffic, and on the basis that you have mentioned you propose to charge, and you have charged all of that traffic with an equal proportion of station services, as you have the interstate traffic which begins or ends in the state of Arkansas?

A. I would hardly say an equal proportion, but on the average we have charged all interstate tonnage with one station handling,

recognizing that the so-called second-class of interstate would
3292 have more handlings than the trans-state, but that on the average it would all have one handling.

Q. What have you done in regard to terminal expenses, in regard to that class of traffic, both the interstate and trans-state—all interstate traffic? What allowance have you made for that?

A. What terminal expense do you refer to? "Terminal" expenses have been used in so many connections in this case that I am a little mixed up.

Q. What I had in mind was "yard" expense, Mr. Ludlam?

A. Those have been divided between local and through trains on the basis of the number of cars handled at terminals.

Q. Do you think that is a fair method of dividing that expense, as to the freight that was passing through those yards or division points?

A. Yes, sir.

Q. If a car of trans-state freight is set out at Hoxie or Traskwood, you would attach just as much terminal expense to that as you do to any other car?

A. Yes, sir.

Q. Do you believe that is a fair apportionment?

A. On the average I think it would even up.

Q. Do you believe it is proper to impose the same charge, terminal charge, at intermediate stations, as you do at terminal stations that the movement originates at or——

A. After you have provided for the so-called station expense, I believe that is proper.

Q. What has station expense to do with trans-state move-
3293 ment?

A. The station expense would have a good deal to do with a trans-state movement originating or terminating in Memphis.

Q. That is a very small amount compared with the entire movement in Arkansas?

A. Station expenses would have a great deal to do with trans-state freight delivered to or received from a connecting line in the state of Arkansas, of which there is a large volume of business.

Q. What is the comparative expense at intermediate terminals and at originating terminals?

A. Why, if you separated the so-called "station" expense part of it, I should not say there was any.

Q. Not any difference?

A. No, sir; on the average.

Q. I want to call your attention to your testimony in the Missouri Rate Cases, at pages 1889 and 1890:

Your attention was called on that occasion to the statement you had made that there were two terminals in the case of purely state freight, and you thought in the haul of 222 miles or the haul of 237 miles, as the case might be, there would be more than two terminals; you explained that by saying that there would be a division point in the course of that haul, where there would have to be some attention paid to the freight:

3294 And then you were asked:

"Do you mean to say that at each of those division points it would be equivalent to a full terminal expense at the point of origin or the point of destination?"

And your answer was:

"A. No, sir, the intermediate terminal expense would be much less than the terminal expense at the point of origin or at the point of destination."

Mr. Taliaferro, the representative of Haskins & Sells, in the conducting of the state case in that litigation, at page 2212, testified:

"Q. What I want to know is, whether it is a fair result of your testimony to say this: that so far as the Missouri Pacific Railway is concerned, the terminal expense is three times as great where it is an originating or terminal expense, as it is where it is a mere passing through expense?

A. If you confine that to the business that the Company itself is taking through that terminal, I think that might be a fair relation between the two.

Q. That is the proportion you assume, that it costs three times as much to do that one-third of the business that you estimate terminated or originated at Kansas City?

A. Yes, sir."

Q. Now, in view of those statements in that case, can you maintain now that the intermediate terminal expense is about equal?

A. There would be two answers to that question: It would require two facts to reply to the question:

In the first place, the expenses of the Kansas City Terminal were very much larger, probably, than the expenses at any terminal in Arkansas.

3295 Furthermore, the terminal expense in the Missouri Case includes the station force. Here the station force is separated.

The "station expenses" on the Iron Mountain in the state of Arkansas are shown to amount to $233,626.94 as compared with "Yard and terminal" expenses of $236,262.07.

That is to say, that in this instance in the Arkansas Case, we have specifically apportioned one-half of the expenses that were considered as a whole in Kansas City.

Q. But are not the number of tons handled there a matter to be considered and would the unit of expense be such as you applied when you come to consider the volume of business and number of tons handled at those large stations?

A. From my study of the situation at Kansas City—and we made rather an exhaustive study of that terminal expense—we reached the opinion that it would cost about three times as much per ton for a shipment originating or terminating at Kansas City as it would cost for a shipment passing through, but that included not only what is known in this case as the "Yard and terminal expense" but also what is known in this case as "station expenses."

In this case we have separated the "Station expense" from the

other expenses and apportioned the "Station expenses" specifically to the tonnage handled.

Q. But in view of the fact that the character of the service that is embraced in the "Station expenses" is not applied or ren-
3296 dered to trans-state business, how can you bring that into it as an element?

A. I have already attempted to explain that we apportioned one station handling to all of the interstate freight on the assumption that while there was some trans-state freight that might not have the use of the station expenses, other than the telegraph and items of that nature, that there was so much of it that had not only one terminal handling but two terminal handlings, or more, that we thought that would be relatively a fair apportionment and it is an apportionment, an arbitrary apportionment, and we believe, approximately correct.

Q. Now, assuming, Mr. Ludlam, for the purpose of the question, that as a foundation for the basis which you say you acted upon in regard to station expense—that is to say, you assume that there was some interstate service there that was a little extra: would that justify you in charging a ton of trans-state freight the same amount of terminal service that you do a ton of other freight, when the terminal cost at intermediate stations is only ¼—and that embraces all trans-state business in Arkansas—of what it is at the originating stations? Do you not lose sight of the difference and do you not do an injustice to the trans-state when you make a division on such a basis as that?

A. Where do you get the figures?

Q. From your testimony in the Missouri Case.

A. That the intermediate expense is only ¼ of the
3297 originating terminal expense?

Q. From the testimony I have just read to you?

A. But I told you the situation and figures are entirely different. One has no relation to the other.

The President of the Pennsylvania Railroad Company stated some years ago in one of his reports in 1894, that on all freight that the Pennsylvania Railroad Company hauled from New York to Pittsburg and west of Pittsburg, they had on the average to haul it, I think, 90 miles west of Pittsburg, from Jersey City, to earn enough to pay the expense of getting it across the Hudson River, but the cost of getting it across the Hudson River would have no relation to the terminal expense in the state of Arkansas, and the expense of the road at Kansas City has no relation, particularly so as the items entering into what was known as "Terminal expenses" in Kansas City is separated here between "station expenses" and "Yard expenses".

I might say incidentally, Mr. Moore, that as I recall it the railroads in the Missouri Case attempted to apportion all the expense of the Kansas City terminal to the business originating and terminating at Kansas City and assumed that none of it appertained to the through business, their contention in that case being somewhat as it is in the state of Arkansas, that the through business had practically no expense connected with it. They did not apportion any of the Kansas City terminal expense to it.

3298 Q. Are you not mistaken in your statement that in the Missouri Case you did not separate "Yard service" and "Station service" and in that connection I will call your attention to Exhibit 35, which I understand is one prepared by Haskins & Sells and used in that case:

Please look at that and then state.

A. We did in this exhibit, but we did not——

Q. What is that exhibit?

A. Exhibit No. 35.

Q. Was that an exhibit in the Missouri Case?

A. I think so, it is marked "Exhibit 35". I couldn't tell whether it was the Missouri Pacific or the C. B. & Q.

Q. Was it filed in that case, or the original of it? This is the exhibit that was filed by you in that case, is it not?

A. I presume it is; I don't know.

Q. It was prepared by Haskins & Sells?

A. That exhibit was, undoubtedly.

Q. Mr. Ludlam, in the exhibit prepared by your firm, you have charged 19.33% of "Traffic expenses" to mail and express:

What connection is there between mail and express and traffic expenses that would justify that charge?

A. We have apportioned the traffic expenses on the revenue basis.

3299 Q. Why should any part of traffic expenses be charged to mail and express in a division that you attempted to make in detail?

A. Because we have not attempted to apportion the traffic expenses, but have accepted the railroad company's apportionment of those expenses.

Q. I know that was based on a general division on the basis of the revenue, but now you are attempting to dissect it and deal with it in detail:

Doing that do you believe it is proper to charge any part of the traffic expenses to mail and express?

A. We have not attempted to dissect or apportion the traffic expenses.

Q. In other words, you apply the revenue theory when it is profit.

A. No, we applied the revenue theory when we had no other basis that we thought was equitable or that we could give a correct result from an approximately correct result.

I said we applied the revenue theory. I meant we accepted the railroad's distribution when we had no basis that we thought would give an approximately correct result.

I might say that the classification of operating evpenses as prescribed by the Interstate Commerce Commission, includes under its instructions as to what shall be charged to traffic expenses, the provision for the salary of the general express agent.

3300 Q. Is not that on railroads where the railroads maintain their own express and the express is not operated by a separate company.

A. It would depend on whether a railroad had such an officer.

Q. Has the Iron Mountain or the Cotton Belt such an officer?

A. I don't know.

Q. Was not that a pertinent subject of inquiry before making a charge for any part of that expense?

A. If we had made the charge we would have looked up the basis, but not having a basis to go on, we accepted the company's distribution.

In my judgment, traffic expenses are pretty hard to apportion. I should not think though, that the same per cent would apply to mail and express business as would apply to the freight business.

The salary of the general mail agent would also be charged to the traffic expenses if there was one, I think.

Q. How is that divided in your accounts, Mr. Ludlam, the salary of the general mail agent?

A. If it is charged to the "Traffic expenses" I think it is—all the traffic expenses are divided by the railway on a revenue basis, and we have accepted their distribution.

Q. Do you know where that mail agent's salary is charged in the accounts of the Iron Mountain?

3301 A. No, sir, I do not.

Q. In the accounts filed in this case by the Iron Mountain?

A. I do not.

Q. I think, it is charged to the "General expenses"?

A. (After examining document) Yes, sir.

Q. Among the objections urged by you to the revenue as a proper basis of dividing expenses, I notice you state here it assumes that the efficiency of the car, we will say, delivering less than a carload of freight, was only one-half as great in the case of the interstate as in the case of the state because they would receive only one-half as much per ton per mile on the movement of the freight.

Q. Now, it is a fact that the statistics in this case show a difference in the length of haul, in one case the ratio being one to five and in the other one to three.

Does not that difference in length of haul have a very material effect on the matter to which you were referring in that testimony?

A. In my opinion it has a far more material effect on the revenue per ton per mile than it has on the cost per ton per mile.

Q. One of your objections as I understand your testimony, is that it shows that only one-half of the effeciency of the car delivering one kind was only one-half as great in the interstate as it would be in the case of the state freight:

3302 Is that not a very mild assumption? Is there not more than that difference, really?

A. It is approximately one-half. That is a broad assertion to say a thing is worth what it will earn—that 15 tons of state freight will earn the same as 30 tons of interstate freight; it is apparent that a car carrying 30 tons of state freight is earning——

Q. What becomes of that objection to the revenue theory?

A. Because the rates are not universally uniform.

Q. What does the statement that you prepared for me at the noon

recess show to be the average cost per ton per mile, between state and interstate?

A. The average cost per ton per mile on the figures shown on our exhibits, for the six months ended December 31, 1907, amounted in the case of state freight on the Iron Mountain road, to 8.22 mills.

In the case of interstate freight on the Iron Mountain road, it amounted to 4.38 mills.

In connection with state freight on the St. Louis Southwestern road, it amounted to 11.78 mills and in the case of the interstate freight on the St. Louis Southwestern road it amounted to 4.47 mills.

3303 Q. You testified you spent much time in the investigation of the questions that arose in the Missouri case in which your firm was engaged for about three years; didn't you testify in that case that the difference in the cost in the handling of state and interstate freight, would or might run from ten to twenty-five per cent?

A. I think so.

Q. You have found from investigation in this case, that your impression from which you testified in that case was mistaken?

A. No, sir, not at all; I have found that he cost was not the same in the State of Arkansas as I thought it was in the State of Missouri.

Q. Do you account for that difference in the two statements, one made here now as a result of these formulas, and the statement contained in your testimony in the Missouri case, on the difference in the conditions in Arkansas and Missouri?

A. I should estimate, if I was making an estimate now in the State of Missouri, that the state freight would cost about 30% more than the interstate, rather than 25. My testimony in the Missouri case, as I recall it, was that it would not exceed 25%; I should raise it now to make it about 30%, and the difference between than 30% increased cost in the State of Missouri and the increased cost in the State of Arkansas, as shown by these exhibits, reduced to a ton mile basis, in compliance with your request, would

3304 be accounted for in the difference in the traffic; you must remember that the Missouri Pacific has an immense state traffic through the State of Missouri, between St. Louis and Kansas City and Kansas City and Joplin, and St. Louis and Joplin.

Q. Were you testifying in making that statement, with reference to any particular road engaged in the litigation or with regard to the conditions generally with reference to all parties engaged in it, in the testimony which I have just read. I understand there were 18 different roads engaged in that litigation; upon the face of it, this testimony is general and is not confined to any particular line of railroad.

A. My recollection is that was testified as to the Missouri Pacific or the C. B. & Q., that they were the figures I had before me at the time.

Q. Let me call your attention to the question:

"From your knowledge of the general situation of railroads"—

evidently referring, I imagine to the railroads engaged in the litigation—

"both as an operative and expert, what would you say was the increased expense if any, in handling the average ton of state freight as compared to the average ton of interstate freight?"

And your answer was what I called your attention to awhile ago; that seems to have been general in relation to the subject generally.

3305

A. What page is that?

Q. Page 924.

A. I was referring specifically to the handling of freight in the State of Missouri because that was the only state I had ever gone into that question *in*.

Q. But you were not referring to any specific railroad?

A. I am inclined to think I was referring to the three roads that were specifically examined in the State of Missouri, The Chicago, Burlington & Quincy, Missouri Pacific and Wabash, but I notice a little farther on, I stated that in many instances of short hauls, the two terminal expenses might exceed 25%; I say, "it is very hard to form a definite opinion for the reason that there are many conditions where there would be no increase in expense where the revenue would be greatly increased, and in many cases of short hauls, two terminal expenses might exceed 25%."

Q. What is the average haul in the State of Missouri, compared with Arkansas on these two lines?

A. The average haul of state freight on the Missouri Pacific Railroad in the Missouri case, was 52 miles, and the average length of haul of interstate was 105 miles, making the haul of state freight about 1½ that of the interstate. On the Chicago, Burlington & Quincy, the total haul of state business is 81 miles, and of all interstate business, 135 miles in the State of Missouri.

3306

Q. Speaking of a charge for depreciation, to which you referred in your examination in chief, where you stated that the railroad companies are required by the Interstate Commerce Commission to charge specifically against their operating expenses for depreciation on their equipment, I want to ask you if the order of the Interstate Commerce Commission does not relate alone to rolling stock?

A. Yes, sir.

Q. And do the regulations of the Interstate Commerce Commission not require that expense incurred for renewals shall not be charged to operating expenses—that is, shall not be charged to repair accounts?

A. You mean the replacements?

Q. Yes?

A. Yes, sir.

Q. So your statement would only be applicable to repairs on rolling stock, your statement about the depreciation under those rules?

A. Yes, during the period covered by our report.

Q. Mr. Talliaferro, the representative of Haskins & Sells, in the Missouri cases, testified did he not, that you cannot sep-
3307 arate the cost of running a passenger train between the cost of carrying the passengers and the cost of carrying mail, express, etc.—page 457 of the printed record?

A. I haven't that testimony here; will you read it to me in full?

Q. I will show it to you.

A. I believe he so testified.

Q. And yet that is what you have done in the formulas filed by Haskins & Sells in these cases, isn't it?

A. Yes, sir, we have records and data here that we did not have in that case.

Q. That data was as easily accessible in that case as it was in this?

A. I presume it could have been worked out.

Q. You were engaged longer in that case than you were in this?

A. Yes, sir, but we profited in this case by our experience in the other case.

Q. You read the rates from St. Louis to points in Texas from a tariff sheet to which you referred this forenoon. I want to ask you if you are acquainted with the relative values of the several commodities between which you made your comparison as to rates?

A. Only in a general way.

Q. For instance, you compared the rate of 43 cents on
3308 excelsior with the rate of 55 cents on bar iron, do you know the relative value of those articles?

A. Not the relative value of the two articles, but I know their relative casualty risk in transporting them on a railroad.

Q. But does not the value enter very largely as a controlling factor in the rate?

A. It has been testified to here that it is an element, but in the case quoted there, it is an element where the value would conflict somewhat with the density.

Q. But is not bar iron of far greater value than excelsior?

A. I should assume so. I do not know in that case, which the traffic man was considering, whether the density or the value or casualty risk.

Q. Take beer in glass and bar iron, how would they compare in value. You quoted those rates at 48¢ for beer and glass, and bar iron 55.

A. The casualty risk on the beer would, in my judgment, be much greater; the lost space on beer would also be greater. As to the actual commercial value of the two articles, I would not care to express an opinion.

Q. Take potatoes and horse shoes, there is a relation of value there that might account for the rates you mentioned?

A. I think it would take a very good traffic man to explain just what would account for the difference.

Q. I am not going any further into this, but I want to call your attention to that for the purpose—I am questioning you about these

matters for the purpose of calling your attention to the rela-
3309 tive values; is there not a difference there which is recognized as a difference in rate making?

A. I do not think that had anything whatever to do with the making of that rate. I do not think it was considered. The traffic men have told us that casualty risk was considered; it was one of the first things; that the density was considered; that the value was considered; I would say, speaking generally, from the little knowledge I have of rates, that the main consideration in making rates, was the basis of what the traffic could pay.

Q. Yes, we understand that, but isn't the value the most important thing to be considered by a traffic man in making rates?

A. No, sir, the value would have no relation to the traffic man, except as to the casualty attached thereto might control.

Q. How about that element you have just mentioned?

A. That would have a great deal to do with it; the more valuable the article, the more freight it can afford to pay.

Q. Now, there are some of these that are necessities of civilized life, preserves in glasses and things like that, what influence would the fact that those are necessaries have with the rate making man in fixing his rates?

A. I don't think I am qualified to state.

3310 MAURICE WRIGHT, being first duly produced, sworn and examined, deposed as follows:

Direct examination.

By Mr. HILL:

Q. Please state your name, age, residence and occupation?

A. 35 years, occupation, accountant, Webster Grove, Mo.

Q. What is your present occupation or employment?

A. I am employed as an accountant by the firm of Hamilton Brown Shoe Co.

Q. Before you were employed by Hamilton Brown Shoe Co. were you employed by the Arkansas Railroad Commission working on the accounts in this case?

A. Yes.

Q. Prior to that what were you engaged in?

A. I was engaged in the railway service?

Q. For what road?

A. For the Missouri Pacific System.

Q. What was your service?

A. That of Travelling accountant.

Q. Commonly called travelling auditor?

A. Yes, sir.

Q. What was your territory as travelling auditor?

A. Just at the time I discontinued my service with the
3311 Iron Mountain Railway Co., my territory was from Hoxie to Texarkana and the Camden Branch.

Q. State generally how much experience you have had as travelling auditor on the Iron Mountain in Arkansas?

A. I was employed seven years, and I interchanged territories so that, in that time, I travelled over the entire mileage of the Iron Mountain Railway Co. in Arkansas frequently.

Q. In the discharge of your duties?

A. Yes, sir.

Q. How long were you travelling accountant for the Iron Mountain — Arkansas?

A. Seven years.

Q. What familiarity did that work give you with the movement of trains in Arkansas?

A. My work as travelling accountant required that I use both freight and passenger trains in going from station to station. I frequently used freight trains both local and through, so that I gained considerable familiarity with the movement of freight trains.

Q. Are you familiar with the tracks, and side-tracks, and generally, the line of the Iron Mountain in Arkansas?

A. Yes, sir.

Q. Are you familiar with the method in which they handle through and local freight trains?

A. Yes.

Q. Pretty near lived on them for about seven years, didn't you?

3312 A. Yes.

Q. In the exhibits that have been filed by Mr. Wharton in this case, he has divided the maintenance of way and structures expense on freight traffic between local and through train service on the basis of the engine and car miles of each class during a given period, and in arriving at the number of engine and car miles, he has added 50% to the engine mileage for station switching.

I want to call your attention to that proposition, after he has added 50% to the engine mileage for local switching,—I will ask you if you are familiar with the station switching done by local trains in Arkansas, and were you familiar with that condition in 1907?

A. Yes, sir, I was familiar with that condition.

Q. I will ask your opinion, from your familiarity with it, as to the correctness of the 50% being added to the engine mileage on this account?

A. I know of no method of determining accurately what mileage the local engine makes in station switching, but it is my opinion that is can be determined with reasonable accuracy and that 50% is high. I think that 40% would be more nearly correct.

Q. Have you made any calculations to verify your opinion on that subject?

A. Yes, sir.

Q. I wish you would state the methods you have used in

3313 arriving at that and illustrate it with the different freight divisions with which you are familiar.

A. In my work as travelling accountant, it was necessary that I check all the records of stations where we had agents. It was necessary in checking to check each waybill covering freight consigned

from that station; also, to check each waybill covering freight consigned to that station. In doing that for a number of years, I became familiar with the average business handled at those stations. I also am familiar with the length of the side-tracks as they are known—passing tracks and unloading tracks. Also, the greater number of industries located on those tracks. Being thus familiar, I have worked out, taking as an average all the cars set out and picked up, or that there is a possibility of being set out and picked up, in the movement of the local freight each day. One division is that from Newport to Little Rock.

Q. Just take that in detail, and explain how you worked that out and the result of it?

A. I will state, if there was more than one car to be set out on a siding, and they occupied positions in the train intermediate with cars destined to other stations, as many additional trips of the engine would be necessary as there were cars to be set out, although it would not be necessary that the engine trips be the entire length of the siding; that is, it would not be necessary that the
3314 engine trips should be more than 75 feet long;—what is known in railroading as "making a kick" of the car to be set out, and replacing the intermediate car going to another station, back on the main line by another kick, and by a short movement, kick in the other car on the side-track, and then he might make the entire run of the siding, placing the car where it was desired to be placed.

Take the town of Olyphant, the average receipts and shipments from that station would not be more than one car per day, that is for one train; in setting out and picking up that load, the engine might make four trips the entire length of that siding, which is 2400 feet, which would be 9600 feet.

Grand Glaize is the next station; one car set out and one picked up, four engine trips the entire length of the siding, would be 4800 feet; that is, 4 times 1200.

Bradford, two cars set out and two picked up, eight trips of the engine, or 3,000 feet would be 24,000 feet.

Russell, the next station, one set out and one picked up, would be four trips the length of the siding; 1500 feet would be 6,000 feet.

Bald Knob, set out five and pick up five, ten trips of 2100 feet, would be 21,000 feet.

Judsonia, two set out and two picked up, eight engine trips, 21,600 feet.

3315 Kensett, 4 set out and 4 picked up, ten engine trips, 27,000 feet.

Higginson, one set out and one picked up, 4 engine trips, 10,800 feet.

Garner, 1 set out and one picked up, 4 engine trips, 10,800 feet.

McRae has no passing or side-trick, but they have a spur about 150 feet long; if necessary to set out or pick up a load there, it would not be necessary for the engine to move more than 300 feet.

Beebe, 3 set out and 3 picked up, 12 engine trips, 28,000 feet.

Ward, none set out and one picked up, 2 engine trips. In my

familiarity there with Ward, I have only allowed one pick up; there are no cars unloaded there, not more than two or three a year; I have allowed two engine trips, 6,000 feet.

Austin, one set out, one picked up, 4 engine trips, 10,800.

Cabot, 3 set out, 3 picked up, 12 engine trips, 28,800 feet.

Holland, one set out, one picked up, four trips, 11,800 feet.

Jacksonville, 1 set out, 1 picked up, four trips 12,000 feet.

McAlmont 1 set out; there is nothing picked up there hardly; two trops 2100 feet, would be 4200 feet.

3316 That makes a total of about 40 miles.

Q. That is the mileage on that division made in station switching? What is the total mileage?

A. It is 84 miles from Newport to Little Rock. On that basis, which is high for this reason, in setting out four cars as I have stated before, it would not be necessary to make the entire run of the sidetrack; it would be a series of short forward and backward movements of the engine, although I have allowed for the entire run of the sidetrack.

Q. You have made the allowance there for the maximum switching that would be done for that service?

A. I have endeavored to do so.

Q. And have taken the average service performed at each one of those stations, based upon your experience in checking at those stations?

A. Yes, sir.

Q. That would give what per cent?

A. About 50%.

Q. Now, take some of the other divisions, without going into the details; you have them here if Mr. Moore wants to question you about them; I will save time by having you give the results of your figures, unless Mr. Moore wants them detailed as you did that one; you have two or three others there, representative ones?

A. Yes, sir.

3317 Q. You have it in tabulated form?

A. I have the main line from Little Rock to Texarkana, and the Arkansas Division from Pine Bluff to McGehee, and Central Division from Van Buren to Little Rock.

Mr. MOORE: If you will let us have that memorandum, it will not be necessary to go into the details of it.

Mr. HILL: Al- right.

Q. Just state generally what the percentages are on each one of those divisions?

A. On the local run from Argenta to Malvern, I have figured 45%; from Malvern to Texarkana, 35%, from Van Buren to Russellville, 32%; from Russellville to Little Rock, 50%; from Pine Bluff to McGehee, 40%.

Q. Are those divisions you have given, in your opinion the heaviest divisions of the road?

A. Yes, in my opinion they are the heaviest local divisions of the

Iron Mountain—the heaviest is between Russellville and Little Rock.

Q. That is the one that runs 50%?

A. Yes, sir. The others are as heavy as there are in the state, the ones that I have used; the White River Division is very light, and the Valley, between Little Rock and Pine Bluff, is very light.

Q. How about the Memphis Division?

A. The Memphis division is about the same as the Arkan-
3318 sas Division from Newport to Little Rock.

Q. About the same as the main line?

A. Yes, sir.

Q. Did you check that in any other way than what you have given?

A. I have made a comparison according to the Missouri Pacific time tables of the time required or rather the time allotted to trains 96 and 98, local trains, running between Texarkana and Little Rock, and the schedule time of that train is 13 hours and 45 minutes. #56, which is one of the Red Ball freight trains running between Texarkana and Little Rock is scheduled at ten hours and 30 minutes.

There you will see there is about 40% more time allowed the local train than there is the through train to make the same distance; that would tend to support the statement.

Q. It would look like the man that made the time card figured about like you did?

A. It would tend to support that belief, yes, sir.

Q. Have you any familiarity with the Cotton Belt road Mr. Wright?

A. I have some, but not very much.

Q. You wouldn't know the stations on that line as you would know the stations on the Iron Mountain I presume, and the handling of freight at each station?

A. No, I have never had occasion to know the amount of
3319 business done at Cotton Belt stations, except at Little Rock.

Q. Do you think the average that you have allowed for these stations in making these calculations fairly represent the business done at those stations, during representative periods of the year?

A. I think it is high; this table I have worked out would only represent one train; the other train moving in the opposite direction under that same service would not double the number of cars, and I think I have given the maximum amount of business that is handled at these stations.

Q. I don't understand your reference to double the number of cars?

A. In working by this schedule, I have only taken the train going in one direction; if the train moving in the opposite direction performed the same service, for instance, at Homan, that would represent four set outs and four pick ups for that day.

Q. It would represent double the movement of just what one car would represent?

A. Yes, sir.

Q. You think taking one car and estimating that the other train would do the same work coming back, would represent the business of the local both ways?

A. I think it would be a very high average, yes, sir.

Q. You have attempted to make an average that would be liberal, and so there could not be any just criticism
3320 of it?

A. I have attempted to do that.

Q. In this exhibit, under maintenance of freight cars, there is an assumption that a local train makes a stop every five miles, and each through train makes a stop every twenty miles, and it is assumed on the testimony of expert witnesses that the stopping and starting of trains is a cause of injury to the car equipment, and in order to get at the relative stopping and starting of the two kinds of traffic, some inquiry has been made upon that subject.

I wish you would state what would be your opinion of the relative stops of the two trains from your observation of those trains?

A. Taking the Iron Mountain system in Arkansas, I think that five miles average stops for local trains is very nearly accurate, and that twenty miles for through trains is a very fair average; that is my opinion, based on having frequently ridden on through freight trains and very frequently on local freight trains.

Q. There is another item in here somewhere of an assumption, I don't remember the head, but I can state it, that the interstate passengers make use of the Pullmans, compared with the interstate passengers in the proportion of 25% to 75%. In other words, one-fourth of the passengers that ride in the Pullmans are state, and three-fourths of them are interstate passengers. That is made on the passenger mileage basis.

3321 What is your opinion from your riding on trains through the state, as to that division, from your observation?

A. It varies on different divisions; what is known as the Valley Division from Little Rock to the State line——

Q. Going south?

A. Yes, going toward Louisiana—Alexandria—or going in the opposite direction, those day trains known as 105 and 106, the state travel—each train carries one Pullman car—the state traffic on those cars is known as intrastate traffic, is probably 50%, I would guess; from frequent riding on that car and observation of passengers getting on and off.

On the main line, known as the Arkansas Division, I have ridden frequently on all the trains except one, that was running during October, 1907, and my opinion is that on those trains, 85% at least, is interstate business.

That is based on both having ridden the trains and by having been with the agent when he was selling tickets, and by getting on the train at Texarkana and finding the Pullmans already occupied by passengers coming from the south and southwest.

Q. How about the Memphis Division?

A. Practically all of the Memphis Division is interstate business;

the passengers between Memphis and Bald Knob, the way the trains would run—I never observed that they used the Pullman
3322 car, but all the business between Memphis and Little Rock is interstate; I would say that at least 85% of that business is interstate.

Q. From where?

A. On the Memphis Division trains, running between Memphis and Little Rock.

Q. Nearly all those are either going to Memphis or coming from Memphis?

A. Yes, sir.

Q. How about the Ft. Smith division?

A. The day trains do not carry Pullmans, and the night train, one of them as I remember, is an interstate train, that is, running between Little Rock and Fort Smith, and one of those trains, one running interstate to Ft. Smith, I would say that 85% of that business was interstate, but on the other train running between Ft. Smith and Little Rock, I believe runs over the Frisco Bridge, probably would be 75% of those passengers would be interstate passengers; that many ride between Ft. Smith and Little Rock.

Q. What about the White River Division, they carry Pullmans on them, don't they?

A. They operate a Pullman intermittently there; I don't know whether they operate it regularly at all; it was taken off for a great many months.

Q. That was for through service?

A. Yes, sir.

Q. Was there any state traffic to amount to anything on
3323 that train?

A. No, sir, very little state business on that train.

Q. Taking it as a whole, what is your opinion of what percentage of state passengers would ride in Pullmans, and what percentage of interstate?

A. Between 80 and 85%.

Q. You mean are interstate?

A. Yes.

Q. You think this estimate here of 75% is very liberal to the interstate traffic?

A. I think it is.

Cross-examination.

By Mr. MOORE:

Q. When did you quit the employment of railroads?

A. August, 1909.

Q. What have you been doing since then?

A. I was employed by the Arkansas Railway Commission from about August 1st to March 1st. Since that time, I have been employed by Hamilton-Brown Shoe Co.

Q. In what capacity were you employed by the Arkansas Railroad Commission?

A. As investigator of the records and accounts of the Railway Company in the Arkansas rate litigation.

Q. What were your duties during the time you were working for the Railroad Co.?

3324 A. My duties were that of travelling accountant, or travelling auditor, as they are commonly called.

Q. Were you engaged as travelling accountant all the time you were employed by the Railroad Company?

A. No, sir, I was employed by the Railway Company from December, 1895, to August, 1909. In the greater part of the time, I was employed as an accountant; I was station accountant at Little Rock part of the time, and was travelling auditor; prior to that time, I was station accountant and cashier at Little Rock.

Q. What were your duties then during the time you were travelling auditor?

A. The duties of travelling accountant on the Iron Mountain are very numerous. The principal duty is to check accounts of station agents, and to make transfer of station accounts from one agent to another.

Q. You were going, in the discharge of your duties, to the various stations on the railroad?

A. Yes.

Q. And you were checking up the accounts?

A. Yes.

Q. What part of the accounts was it that you checked up?

A. We ascertained that the revenue, as far as it could be ascertained, had all been accounted for, and to ascertain as far as possible that all the cars that had been set out or picked up at that station, had been properly waybilled, and to check the warehouse to

3325 see that freight was on hand for all the bills that the agent was claiming credit for as being on hand freight, and dispose of over and short freight that might be at the station at the time, and a great many other things.

Q. The first one you enumerated was to check up the receipts and see that all the revenue that came into the hands of the agent was accounted for?

A. Yes.

Q. I suppose you would take his books or different records he kept, showing the receipts, and compare that with either the disbursements he had made and the cash he had on hand—I don't mean the disbursements—the remittances he may have made. That was the way you did that?

A. Yes.

Q. You say you also checked the waybills. Tell me just what you would do in connection with that?

A. That was necessary to check them?

Q. That was necessary, in looking over the accounts of the agent with reference to his receipts, was it? That is to say, the waybills were the foundation of the freight station agent's receipts; it was from that receipt you had to check them up?

A. Part of his receipts.

Q. In other words, your purpose was to verify the accounts and keep track of the cash that had come into the hands of the agent, wasn't it?

A. Yes.

Q. And in verifying the accounts, you checked up the
3326 waybills?

A. Yes.

Q. Your duties in regard to keeping accounts of cars that were set out and waybills, was also for the purpose of making a check on the revenues handled by the agent, wasn't it?

A. Yes.

Q. And also the check on the freight that was handled in and out that you spoke of a moment ago, you kept a check on the freight on hand, that is, I suppose you mean by that, you would determine from the waybill what had come into the station and by looking over what was on hand, you verified the showing made on his books as to what had been delivered and paid for. That is what you mean?

A. Yes, sir, if it wasn't in the cash books, it was supposed to be on hand, either carload or less carloads.

Q. The over and short freight was on hand?

A. The freight over at the station that the agent didn't know was in his warehouse, which was commonly the case, that you would find freight in the warehouse the agent didn't know was in there; that was part of the duties of the travelling accountant, to see that freight was properly taken care of, and forwarded to destination, or reported to the freight claim agent.

3327 Q. All those duties and various acts performed by you in the discharge of your duties, were for the purpose of checking up the accounts and moneys handled by the station agent?

A. That was the purpose, yes, sir.

Q. Did you have anything to do at all with the operations of trains or cars or engines on the road?

A. No.

Q. You had no duties to discharge in connection with them?

A. No, the only duty that the travelling accountant ordinarily has with a freight train, is, frequently to check the conductor's waybills to see that he has waybills for every car he has in the train.

Q. Where do you make that check at?

A. Make it on the train.

Q. You meet the conductor on the train and while you are on the train you make that check?

A. Take the number of his cars, and then check his waybills.

Q. That is clerical work of course? Have you any other duty to perform on the train, or of that character, in connection with the contents of the trains?

A. I frequently accompanied the local freight train to see that agents were careful about checking the freight unloaded at their station with the conductor, to see if any discrepancy existed between the agents' and conductors' figures, that they were properly noted.

3328 Q. Your duties were all clerical and none of them had anything at all to do with the operation of the trains or anything of that sort?

A. No, sir.

Q. And what you learned about the movements there at the stations or anywhere else, you gathered from observation like anyone else that happened to be along could make?

A. I acquired that information for a purpose though. I wanted to inform myself as much as possible of the operation of freight trains.

Q. You acquired what information for a purpose?

A. As to how the conductors did their switching, and how the agents gave their orders to conductors to do switching, to see that it was done to make the least possible delay in movement of local freight trains.

Q. What was your purpose?

A. That was my purpose in observing how the switching was done, it was not merely casual observation, it was observing with a purpose.

Q. Was it your duty to do that?

A. Yes, sir.

Q. Was it your instructions to do that?

A. Yes, sir, to do anything you could to see that the business of the company was properly handled.

Q. Did you make any reports as to the manner in which switching was done and engines were handled by the engineers?

3329 A. Yes, I have made verbal reports to the superintendents of the divisions on those matters; I did not make any written reports.

Q. Who was the superintendent of the division during the time you were discharging those duties?

A. Among them was——

Q. Who did you confer with or report to?

A. I was reporting to the general auditor.

Q. Who is the General Auditor?

A. S. B. Schuyler; I was a subordinate reporting to the General Auditor, but at the same time, I conferred with the superintendents.

Q. Were your reports to the general auditor made in writing?

A. Yes.

Q. Whom did you confer with? What superintendent?

A. There were a great many at that time; among them was John Cannon, Mr. M. M. Ritchie, Mr. J. A. Swagart—there have been a great many; I don't know that I can recall them all.

Q. What was the nature of your conferences with those gentlemen, tell me what they related to?

A. They related to the stations, as to the station agents, the performance of their duties, and also any other things that might be of interest to the superintendent, anything relative to the operation of freight trains, that would be necessary or was of advantage to him to know, and I knew it, I would tell him about it.

Q. Tell me just how you made your estimate that there was 4500 feet of switching at Grand Glaize station?

3330 A. As I stated before, my duties in checking those stations gave me a knowledge of about how many cars it might be possible that they would have set out at their station or loaded ready to be picked up at their station by the local freight train. It is a siding at Grand Glaize or passing track or unloading track, as it was commonly called; the length of it is 1200 feet; that is the entire length. If the local train had a load to set out at Grand Glaize, if he was going south for example, he would pull down to the station, uncouple his train, or cut it next to the load that he had to set out, he would open the switch and back that car onto the switch; it might be necessary for him to place that car back to the opposite end of the switch, or make a movement of 1200 feet with that load, although it would be very improbable that it would be done; it was more than likely to move 600 feet or half way into the switch, but it is possible that it might move 1200 feet. It would be necessary then for him to move his engine back from the north end of the switch or south end or 1200 feet again; that would be 2400 feet, and if he had a load to pick up—I should probably have stated that clearer—if he had a load to pick up, he would have taken out the load first; he would have uncoupled his train and gotten the load that he had to take from the station, and kick the load he had to sit out, kicking it back there; there would be four trips, four trips at 1200 feet would be 4800 feet. That is the movement I
3331 have referred to and the method I have used in all these illustrations.

Q. Suppose he had two cars to set out?

A. If he had two cars to set out, and they occupied consecutive positions in his train, the same movement I have described would set out those two cars, but if they occupied positions in the train intermediate with the loads that were going to other stations, it would be necessary for him to make a short movement in addition to the four movements or two movements I have just stated, and I have allowed for that; I have even allowed for him moving the entire length of the switch.

Q. Suppose he had two cars to set out from different parts of the train and both of them at intermediate points in the train, how many movements would he have to make then?

A. If he had the two loads only to set out, it would be necessary for him to make—if those two loads were to be set at the opposite end of the unloading track in the direction in which the train was going, it would be three short movements of the engine, and two long ones; it would be two entire lengths of the siding and three, not necessarily more than 75 or 100 feet.

Q. Work of that kind to be done at stations varies constantly on different trains and at different times, according to the character of the season and character of the business?

A. Yes, it varies, sometimes there would not be anything
3332 and sometimes there would be more.

Q. It varies as the train varies and sometimes varies on different trips?

A. Yes.

Q. You made a general statement as to the average percent of switching between Argenta and Malvern, and between Malvern and Texarkana, between Van Buren and Russellville, and between Russellville and Little Rock and Pine Bluff and McGehee, have you worked that out as you did between Newport and Little Rock?

A. Yes, I have worked it out on the same formula.

Q. You said that you made these comparisons according to the Missouri Pacific time tables of trains 96 and 98, what are those trains?

A. They are local trains.

Q. Where do they run?

A. 96 runs between Texarkana and Malvern and 98 between Malvern and Little Rock.

Q. What is the time of 96 between Texarkana and Malvern?

A. 9 hours and 30 minutes.

Q. What is it between Malvern and Little Rock?

A. 4 hours and 15 minutes.

Q. You also made your comparison on train #56, what is that?

A. That is a Red Ball train, running between Texarkana and Little Rock.

Q. What is the time of that?

3333 A. 10 hours and 30 minutes.

Q. How many people do you find travelling on the Pullman car on the Valley Division between Little Rock and McGehee usually?

A. I have ridden on that car when every seat was full, and also when it was not so crowded; it varies.

Q. Conditions vary?

A. Yes.

Q. Your estimates are of the percent of state passengers that ride on these Pullman cars, that is just based on the same kind of observation, from riding back and forth on them?

A. Yes, it is partly a matter of observation.

Q. You have never counted them for the purpose of making a correct apportionment of them?

A. No, sir, I never counted them for the purpose of making any such division as that.

Mr. HILL:

Q. Have you ever counted them at all?

A. I have no recollection of ever having counted them.

Mr. MOORE:

Q. Did you have the same means of observation as to the passengers who were state passengers on Pullmans and those who were interstate that the superintendents or officials of the road who were making a study of that subject would have had?

Question objected to and sustained.

3334 Q. What opportunities did you have of knowing about the destination of passengers who were on the Pullman cars?

A. It was necessary that I check the accounts of the agent at Little Rock, which is the heaviest Pullman office in the State, and I know that the greater part of the Pullman tickets sold are interstate.

Another source of information I had, as I very frequently came from Texarkana on all the fast trains of the Missouri Pacific, I would find those cars pretty well filled up with passengers coming out of Texarkana.

Q. What means of knowledge did you have from riding on the trains as to the destination of the passengers on the Pullmans, whether they were state or interstate passengers?

A. In riding on trains, I would see—if I was riding on the Valley Division, I would see passengers get on and get off.

Q. Do you mean to tell me that you made it a rule to make observations of that sort for the purpose of measuring up in your mind, the number of men that were state passengers and the number that were interstate; do you mean to tell me you did such a thing as that?

A. I have discussed it many times with——

Q. You can answer my question, can't you. Just answer my question, do you mean to say you were in the habit of making an estimate of how many men in the Pullman car were state passengers and how many interstate?

A. No.

3335 Q. What means did you have of knowing, what interest did you have in it?

A. I had the interest of an employé of the railway company, in knowing what the condition of their business is.

Q. Was it your business to keep account of the state and interstate passengers that travelled on a Pullman car?

A. No, sir, but it was interesting to me.

Q. What reason was there for your concerning yourself with that subject then?

A. It is of interest in this way, that an employee is interested in the revenue of the railway company he is working for, and when he is checking tickets, he will observe what number of tickets have been sold at long distances, and what have been sold to short distances.

Q. I am not asking you what you did or observed when you were checking tickets. I am asking you your interest in the observation of passengers between state and interstate trips—I am not asking your motive in checking tickets, I am asking you what interest you had in making observations when you were travelling on these cars as to how many were state and how many interstate, you say you had no duties to discharge in connection with it. What interest was it to you?

A. It was the interest, as I have just stated, of an employee being interested in the longer route the passenger travels, because

3336 the railway company is paid more revenue then. It was interesting to me to know that.

Q. You were not charged with the duty of making any estimates based upon that knowledge were you?

A. No.

Q. It was not in the line of your duty?

A. No.

Q. Did you obtain any information upon which to base your calculations from checking the tickets you spoke of, checking the tickets—you spoke awhile ago about information upon this point obtained by you in checking the tickets for the passengers, didn't you?

A. The ticket cases, the sales of the ticket agents.

Q. Tell me just what duty you performed in that respect that would give you means of making this apportionment of passengers on the Pullman between state and interstate?

A. It was necessary to make up the report both to the Pullman Co. and to the Railway Co., of the price of tickets sold and the revenue derived therefrom, with the destinations of the tickets, and in making up that statement, I would naturally observe how many were sold to points within the state and how many were sold interstate.

Q. Where did you get the information from, in making that checking?

3337 A. The information is in the office of the ticket agent; the tickets are printed, a great many of them, with their destinations.

Q. Did the ticket agent keep an account of the state and interstate tickets he sold?

A. He kept an account of the destinations.

Q. What I want to get at is this, did he keep such accounts and records as would enable you to tell whether a man that bought a ticket from Malvern to Little Rock, passenger ticket, railroad ticket, also bought a Pullman ticket and whether a man who bought a railroad ticket from Malvern to Poplar Bluff, Mo., bought a Pullman ticket?

A. No.

Q. How could you tell anything about it then from the tickets?

A. I would tell from the Pullman ticket; they were not permitted to sell a man a Pullman ticket who has not proper railroad transportation to the same destination, or at least, as far as the destination of the Pullman ticket.

Q. Do local passengers on Pullman trains buy tickets from the station agent?

A. No, sir, not many of them.

Q. They pay their fare to the conductor?

A. There is a Pullman office at Pine Bluff which sells tickets and at Little Rock——

Q. Don't you know that the great mass of local passengers

3338 going short distances in the daytime, who occupy simply a seat in the Pullman car pay the conductor?

A. Yes.

Q. How could you make any comparison between state and interstate passengers—the station agents reports wouldn't show that?

A. I know that is a very small portion of the business, compared with those who buy tickets and go long distances.

Q. It is a fact that nearly all of the local intrastate passengers, nearly all of the state passengers, who ride on Pullman cars, pay on the Pullman cars and do not buy tickets at local stations?

A. If they are going short distances, yes.

Q. Don't you know you can't go to the records kept by the station agents and make a comparison between passengers who travel in the state and those who travel interstate, from that record, don't you know that?

A. I know you couldn't go to the records of the station agents and determine that.

Q. How do you mean that you had means of information from checking the station agent's accounts?

A. I said that was part of the sources of my information.

Q. Could it be any part that could be relied upon if a large per cent of one class of tickets was not sold there or in there—could any sensible man act upon the per cent made from the information obtained at the station, wouldn't it be misleading if he attempted to do it, don't you know that?

3339

A. I don't know that it would, not in connection with all the other information that I possess.

Q. Now, tell me again just what your duties as traveling auditor were. I want to get you to state them all—all your duties as traveling auditor; all the duties you perform and especially your duties with regard to the checking of the accounts of all those employés whose accounts you had to check?

3340

A. The duties of a traveling accountant of the Iron Mountain are primarily, to check accounts of station agents.

In making that statement "the accounts of station agents" that covers a very broad ground of duties. Among those duties is to count the cash of a station agent; to check his way-bills inbound; to check all of his outbound way-bills and his dray tickets to see that his prepay and advance charges are properly accounted for; to check his ticket cash to see that all of the tickets he is charged for have been accounted for, both Pullman and passenger tickets; to make an accurate check of the warehouse and of his yard; in fact, all the accounts of the station agent should be gone over by the traveling accountant.

In addition to that, he is supposed to keep a general lookout for the performance of the duties of other employés. That is, the traveling accountant is rather considered a moral influence in the service of the railway company and if he sees anything that he thinks is contrary to the best interests of the company he is working for, he should note it and report it to the proper official.

His duties are also to occasionally check the way-bills of local and through freight trains to see that all the cars that are carried in that train have way-bills, which are the instructions of the general officers.

3341

Q. Did you have anything to do with the checking of the expense account?

A. To what expense account do you refer?

Q. Any expense account?

A. If you will tell me what you mean by any "expense account" in that case, I will try to answer your question.

Q. Did you have anything to do with checking the expense of operating trains?

A. Why, I have done such a thing, yes.

Q. I did not ask you if you had done that: I asked you if that was within the line of your duty as traveling auditor at the time you speak of?

A. No, it is not a part of a traveling auditor's duty.

Q. Was there another auditor who did that?

A. There might be. I might be called upon to do so but it was not a part of my duty; I might be specially delegated to do so.

Q. I asked you if there was a traveling auditor who checked operating expenses during the time you were acting in that capacity for the purpose of checking revenues?

A. I don't know.

3342 Q. Would it not be a little remarkable if there should have been a man engaged in that character of service along with you and you would not know about it?

A. I don't know. There might be.

Q. Do you mean that there was not, or do you mean that if there was you did not know it?

A. If there was, I did not know it.

Q. Did you check the operating expenses?

A. I did not.

Q. You had nothing to do with that, did you?

A. Nothing at all.

Q. Your duties were wholly in connection with revenue?

A. As I stated, I might have been called upon to do it, but it was not a part of my understood duties to do that.

Q. Your duties were connected with the revenue, were they not?

A. I have stated what my duties were.

Q. Was that connected with the revenue or not?

A. It all might be connected with revenue. You might speak of it in that way.

Q. You spoke of relative time of through and local trains: did those local trains as a rule keep on that time and make that run within the scheduled time, or were there a good many delays?

A. They were supposed to make it on schedule time.

3343 Q. I am not asking you what they were supposed to do; you have testified here as to having a great deal of knowledge based on information: now I ask you if from your observation——

A. I have ridden on them——

Q. Let me finish my question: If from your observation did the local trains lose a good deal of time from their scheduled time in making their runs?

A. My observation is that about one-half the time, probably, they are on time, and probably one-half the time they may be late.

Q. How does the loss of time on local trains compare with the loss of time of through trains, speaking with reference to the schedule time of each class of trains?

A. They are just about the same.

Q. You think there is as much loss of time from the schedule time on the through as on the local trains?

A. That is my observation.

Redirect examination.

By Mr. HILL:

Q. Mr. Wright, as I understood your answer on cross examination about the percentage of state passengers on the Pullman, you base that upon the various matters that you mention, examining the Pullman tickets in the ticket office and also your riding on trains, your general knowledge of trains?

A. Yes, sir, that statement was made from accumulated knowledge from various sources.

Q. No one of which you answer from, but from all of them?

3344 A. All of them combined.

Q. You spoke of reporting to the auditor in writing and that answer was in connection with some other question that Mr. Moore asked you about writing to the superintendent the various things:

Did you report in writing to the Auditor anythng except in regard to your check of the accounts of the station?

A. Yes, sir, there might be matters of a private nature that were interesting to the superintendent, that I would also report to the general auditor.

Q. That would go to the auditor as well as the superintendent?

A. Yes, I would make him a copy of it.

Q. I don't know how you got the length of those side tracks: did you explain that?

A. I believe I did.

Q. I believe I will ask you to state it again.

A. It is based on the information given in the railway company's time cards. They give the capacity of the passing track as so many cars based on an average of the length of 30 feet to the car: that was the way I arrived at the length of the side track.

Q. You have taken the average length of the car and used that as a factor with the number of cars to be handled on given tracks?

A. Yes, sir.

3345 T. F. WHARTON, recalled, testified as follows:

Redirect examination.

By Mr. HILL:

Q. Mr. Moore called for a statement from you the other day, Mr. Wharton: have you it prepared?

A. Yes, sir.

Q. Mr. Wharton, Mr. Moore called your attention to a statement you had made in an affidavit before Judge Van Deventer, a statement of your firm as to the ton mile being the best basis to use in dividing expenses between state and interstate traffic:

Have you had occasion to study that question more thoroughly since you made those statements?

A. Yes, sir.

Q. What is your view about it?

A. At the time the affidavits were made that was the best basis we had been able to work up to that time; but the whole difference in the cost between state and interstate business being based almost entirely on the cost of local and through service, we thought it advisable to get at the cost of local and through service and make our apportionment of expenses on that basis instead of the ton mile basis.

Q. Believing it was more nearly accurate than the ton
3346 mile basis?

A. Yes, sir.

Q. You had no such statistics as are in this case before you in the Missouri Case, had you?

A. No, sir, not as to the relative handling of freight on local and through trains, car miles, etc.

Q. Mr. Wharton, Mr. Moore questioned you as he did other witnesses, as to the justice of charging the trans-state freight with terminal expense:

You have given your reasons why you thought it was right, I will not go into that again, but I will ask you if you made a calculation showing the difference in cost if you would charge it as his questions indicated it should be, that is, not to allow any station handling for trans-state business.

A. Yes, sir.

Q. Then the question was asked about the terminal handling of trans-state cars: have you made an exhibit showing the difference it would be if you would concede the point and reduce that 25%?

A. Yes, sir.

Q. Mr. Moore questioned you and Mr. Ludlam about the basis of traffic expenses which you put upon a revenue basis, and I want to ask you if you have made a calculation to show if you would use a ton mile basis what effect that would have upon these sta-
3347 tistics?

A. Yes, sir.

Q. I believe you stated in your testimony that you thought the gross ton mile basis instead of the car mile basis would be the

nearest accurate for "maintenance of way," and that you did not make the calculation upon that basis because you had no statistics of the Iron Mountain and you preferred to make both roads upon the same basis:

Attention was called to the fact that there were Cotton Belt statistics: have you worked up what difference that would make if you used the gross ton mile, so far as the Cotton Belt is concerned?

A. Yes, sir.

Q. I will ask you to attach to your testimony the statistics showing these various matters concerning which I have inquired?

A. Yes, sir.

The paper referred to last is marked "Defendant's Exhibit "X," T. F. Wharton, June 3, 1910, M. J. C." and is in the words and figures as follows to-wit:

For Exhibit "X," see Volume 9, page 5840.

3348 Q. I will ask you if you have made similar statistics except as to the gross ton mile, as to the Iron Mountain road?

A. Yes, sir.

Q. I will ask you to attach those calculations to your testimony as "Exhibit Y."

A. Yes, sir.

The paper last referred to is marked "Defendant's Exhibit Y, T. F. Wharton, June 3, 1910, M. J. C." and is in the words and figures as follows to-wit:

For Exhibit "Y," see Volume 9, page 5843.

3349 Q. Mr. Wharton, there was some question yesterday asked as to whether in your exhibits apportioning the expenses between state and interstate on freight business you had taken care of the extra expense for the difference in the length of haul of the two classes of traffic:

I wish you would explain how you have taken care of that extra expense, if you have taken care of it?

A. The station expense constitutes a considerable portion of the extra expense due to the short haul of state business as compared with interstate business, and that is taken care of by apportioning it upon a tonnage basis without regard to the length of haul.

Q. There would be no question of length of haul on that station expense, would there?

A. No, sir.

Q. That is actual handling of the tonnage itself?

A. That is it at the stations. The terminal handling of cars is charged up respectively to the local and through trains in proportion to the cars handled, which takes care of that expense so far as it is local and through; that could not be separated between state and interstate business for the reason that it would be very difficult to tell how the cars were loaded, or whether they were loaded or empty, or whether they were handling state or interstate, or a mixture of both; so that is divided between local and through upon the basis of the number of cars handled for each service.

3350 Q. That is an actual account of the cars?
A. Yes, sir.
Q. And the proportion finally taken care of in the ton mile?
A. Yes, sir.
Q. In what other respect have you looked after that phase of it?
A. Well, all expenses that we have divided between local and through have been divided, aside from those, practically on a car mile or train mile basis, which takes into consideration the length of whatever haul there is in each class of service.
Q. Now, there is shown to be a difference in the length of haul on the Iron Mountain and Cotton Belt: has that been taken into consideration?
A. The statistics show that on the Cotton Belt the local trains are run about one-half the distance, on an average, that the through trains run; while on the Iron Mountain the local trains run almost the same average that the through trains run. That is taken into consideration in the division of the maintenance of cars' expense and the proportion of that expense due to the terminal handling, where on the Cotton Belt we have allowed four handlings for cars in local service and one handling in through service; and on the Iron Mountain for two handlings of cars in local service and one handling for cars in through service.
3351 Q. In that way you think that every element of difference in the length of haul where there is material difference, has been taken care of?
A. Yes, sir.
Q. Mr. Wharton, have you prepared a table of comparison of revenue and expense per train mile for years ended June 30, 1897 and 1907, as shown by the Interstate Commerce Commission reports for those years?
A. Yes, sir.
Q. Will you file that table as Exhibit "Z?"
A. Yes, sir.

The paper last referred to is marked "Defendant's Exhibit Z, T. F. Wharton, June 3, 1910, M. J. C." and is in the words and figures as follows to-wit:
For Exhibit "Z," see Volume 9, page 5846.

3352 ST. LOUIS, *June* 16, 1910.

T. A. HAMILTON, a witness of lawful age, being duly produced, sworn and examined on the part of the defendant, testified as follows:

Direct examination.

By Mr. HILL:

Q. State your name; age, residence and occupation?
A. T. A. Hamilton; 36 years; Webster Groves, Mo., I am an accountant in the employ of Haskins & Sells, Certified Public Accountants, of New York.
Q. How long have you been connected with Haskins & Sells?

A. Since June, 1906.

Q. In what capacity have you been connected with that firm?

A. As an accountant.

Q. Your work has been entirely that of an accountant?

A. Yes, sir.

Q. Prior to your connection with Haskins & Sells, in what line of work were you engaged?

A. For seventeen years in railroad work.

Q. I wish you would state your experience in railroad work, beginning at the first railroad work that you did and state consecutively the various railroad positions you have held and the
3353 nature of your duties in each?

A. I began in 1889, at the age of 15 years, as a messenger boy in the office of the District Passenger Agent of the Canadian Pacific Railroad, at Toronto, Canada.

My duties were such as ordinarily falls to the lot of a messenger boy in an office of that kind. I stayed in that position several months, and in 1890, the Fall of the year, I went to Detroit as a junior clerk in the office of the Assistant General Manager of what was then known as the Chicago & Grand Trunk Railway, part of the Grand Trunk system. I was employed in minor clerical capacities around that office for seven or eight months.

In April, 1891, I came down to St. Louis and went to work for the Missouri Pacific road in the office of the General Auditor.

Q. What was your position there?

A. First I was employed in assorting and filing, in station order, the impression copies of way-bills furnished the Auditor by the Freight Agents on the road, so that they might form the bases of his freight accounting checks of various kinds.

In the spring of 1892 I left the employ of the Missouri Pacific and went to the Southern Pacific at Houston, Texas. I spent three months there in the local freight office, assisting the car accountant, keeping record of the cars in and out of the yard, and on
3354 hand, and the various duties that fall to the lot of a car accountant in a local freight station.

I came back after three months to the Missouri Pacific at St. Louis, going back into the office where I had formerly been employed, and I was employed for sometime thereafter, compiling the auditor's abstracts of freight way-bills in what are known as the "freight journals" of the Company, for the purpose of affording a basis against which to check agents' freight, received reports and other similar reports.

I do not recall exactly how long I was employed in that character of work, but it was not a great while, and after that I was a general utility man—if I may use the term—for the Chief Clerk of freight accounts, a position that now carries the title of auditor of freight receipts of the road.

Q. Is that still with the Missouri Pacific?

A. Yes, sir; and my duties there were practically every line of work in the department, excepting the revising of way-bills. I took the place of men who were sick, men who were over-burdened with

work, and served in various capacities in practically all the work of the department.

One of the duties regularly assigned to me was the handling of the freight auditor's end of freight claims giving the freight
3355 claim agent the settlement as shown by our records that he might know how to properly dispose of the claim.

I stayed with the Missouri Pacific until July 1900, and at that time left the service of the Company and went to the Illinois Central Railroad at East St. Louis, serving that Company as bill clerk for approximately a year—I do not carry those exact dates in my head. My duties with the Illinois Central Railroad were the making of way-bills for transportation of freight over the Company's line and over the roads with which they had connections; the rating of the freight, applying to it the proper rate for its transportation as indicated in the tariffs which were furnished us for that purpose; the classifying of the freight and the making of the way-bill which was to carry it over the road.

After about a year with the Illinois Central, I went to the Louisville and Nashville at East St. Louis, and for about three months, or thereabouts, served in the capacity of bill clerk, performing practically the same duties as I had performed for the Illinois Central road.

At the end of that period I was appointed Chief Bill Clerk for the Company—for the Louisville & Nashville—having charge of the entire outbound freight movement from East St. Louis.

We had a peculiar organization there for a local freight station—at least it appeals to me as such. The chief clerk divided his
3356 organization up into four parts, inbound; outbound; claim and miscellaneous; and accounting, which included the cashier.

He turned over to the man in charge of "outbound" (who, at this time, was myself,) the entire supervision of the moving of freight from the Company's terminals in East St. Louis, making it a charge upon me as soon as it hit the company's track connection or was unloaded on the company's platform. While I did not personally supervise the platform, the platform foreman consulted with me as to the loading of his merchandise cars and was governed by me, largely, in that matter.

The yard-master consulted with me in the moving of freight when there was a question of giving preference to one car over another.

It was also my duty, and the chief part of my duty, to see that way-bills were properly made to cover the freight forwarded from East St. Louis by the Louisville & Nashville. In doing that it was necessary for me to keep up the entire tariff file at the station. We handled freight and had through billing to practically all the points East of the Mississippi and South of the Ohio and Potomac rivers. We operated two "fast freight lines" into Eastern seaboard territory, one all rail and one a rail and water route, which necessitated the keeping of a large tariff file.

3357 It was also my duty to assist in general work of the desk; educate new men as to the handling of the Company's tariffs, and the making of way-bills.

After serving in that capacity from early in 1901, until the Fall of 1903 or 1904—I am a little mixed on that year, I am not quite sure whether it was 1903 or 1904—I was loaned by the Louisville & Nashville to Mr. Peyinghaus, who was at that time the agent of the St. Louis Iron Mountain & Southern Railway at East St. Louis. The Iron Mountain had just secured possession of what was known as the "St. Louis Valley" a line running from Valey Junction, just outside of East St. Louis at that time, to Gale, a connection with the Cotton Belt transfer service to the Missouri side of the Mississippi River. The road now runs to the east end of Thebes Bridge.

Mr. Peyinghaus was about to take charge of the station at Bixby, which was then intended to be the north terminal of what is now known as the Illinois Division of the Iron Mountain road, and inasmuch as the Iron Mountain was reaching practically all its connections at East St. Louis through the medium of the L. & N.—they had leased trackage rights from the L. & N. from Illinois Transfer Junction to East St. Louis—he wanted somebody who knew the east side terminal situation from an L. & N. standpoint, to help him organize his office, the terminal end of it and possibly the yard end of it, and as a matter of personal accommodation to him, the L. & N. loaned me to him for a stipulated time, which was to be two

3358 months.

I went out to Bixby. The yard was not quite completed, but they were about ready to turn it over for transportation purposes and operate it. I spent two months out there as chief clerk to Mr. Peyinghaus, and subsequently to Mr. Kell, who succeeded him, assisting in the organization of that terminal, and handling of freight in and out, and endeavoring to get things in working order.

I went back to the L. & N. at the expiration of that time and resumed my duties as chief bill clerk, continuing in that capacity until the spring of 1905, when I was appointed chief clerk to the general agent at the traffic department of the L. & N., at St. Louis.

My duties as chief clerk to the general agent at St. Louis were practically the conduct of the entire business of the office, aside from the solicitation of freight. I handled the general agent's correspondence; kept up the company's tariff file in that office; quoted rates—I had a bill of lading clerk, but I quoted rates in his absence. It was also my duty to investigate such claims as were filed with our office by patrons of the road. The L. & N. traffic department handles its own claims. That is, the freight claim agent—at least in those days—reported to the General Freight Agent.

A great many claims were filed with us, which made it necessary for me to investigate the loss and damage of freight on the

3359 L. & N. rails, and in the case of stuff going to or received from connecting lines, to make an investigation up to a junctoion point on the L. & N. rails.

I was empowered, over the signature of the General Agent, to

voucher loss and damage claims up to a certain maximum figure, after having satisfied myself of their justice and reasonableness.

I was empowered to pay overcharge claims in any amount, provided I could verify the through rate claimed by the shipper or the consignee, as the case might be. I used to handle some 600 claims per month in that manner. In doing that I became fairly familiar with the workings of the railroad, in addition to the knowledge that I had gained in my local freight office service and my transaction of business with freight agents of the road, in that capacity.

I left the L. & N. in June of 1906, to enter the employ of Haskins & Sells, by whom I am still employed.

Q. Since you have been employed by Haskins & Sells have you had railroad work to do with? If so, what has been the character of that work that you have done?

A. I assisted Mr. Taliaferro, then of our staff, in the Missouri Rate Case, gathering statistics of various kinds; making various investigations in the offices of the Missouri Pacific, Burlington, Wabash, Santa Fe, Kansas City Southern and other roads; compiling various statistics and doing various work outlined by Mr. Taliaferro;
3360 and prepared data necessary to compile our exhibits in that case.

The largest single piece of work that I undertook, was the preparation of a statement of the tons, ton mileage, and revenue on the Burlington road, for the month of September, 1906, the object being to classify the traffic of the road in Missouri, between state and interstate.

The preparation of that statement took about four and one-half months, as I recall it, from early in November, 1906, to about the middle of March, 1907, or the early part of March, 1907.

Q. Where was that statement prepared? I mean, in what office?

A. In the office of the General Auditor of the Chicago, Burlington & Quincy Railroad, at Chicago. The work was done by Burlington clerks, the actual detail. The number of men employed on the work varied from 10 to 30, all that could be spared for that work, but the entire conduct of the work was turned over to me by Mr. Sturgis, General Auditor of the Company and was left solely in my charge, his men doing the work under my instructions. In fact, I had to take the force of green men he had available for the work and educate them as to how it should be done, in the first instance.

Q. I did not quite catch the nature of the statistics.

A. It was a classification of the Company's freight traffic in Missouri, tons, ton mileage, and revenue, as between state and interstate business, for the month of September, 1906.

3361 Q. As shown by the General Auditor's books?

A. The statement was made from the original records of the Company. The Burlington's general auditor has on file the original way-bills covering the traffic on his line, where the way-bill rests on his line.

That was the largest single piece of work I undertook.

Q. What was the other kind of work that you did in connection with the Missouri Rate Case?

A. I assisted in doing some similar work in the General auditor's office of the Missouri Pacific. The period covered in that statement was the month of October, 1905. I assisted in checking the various figures submitted by the various railroads in the litigation and spent a great deal of time compiling such a variety of statistics that it would be almost impossible to tell you in detail now what they were.

Q. Outside of your work in railroad offices and the Missouri Rate case, have you done any other railroad work as an accountant, and if so, what has been the character of the work.

A. Yes, sir. I have assisted on the audit of some of the largest railroads in the southeast, who are clients of our firm. The nature of the work done by me in those audits was largely the verification of revenue accounts, having to do with the agents' accounts,
3362 largely. That was in the summer and fall of 1907, during a hiatus in the Missouri Case.

I have done other railroad work for clients of ours here in St. Louis, in the preparation of statistics from books and records of the companies and assisted our Chicago office on railroad work where the question of taxes was in controversy between the Government and the railroad, based on the gross earnings of the railroad.

I think that is about the scope of my railroad work for Haskins & Sells.

Q. What other character of work have you done for Haskins & Sells since you have been employed by that firm?

A. I have assisted in the audits and have conducted audits myself of various manufacturing concerns; steel plants; boot and shoe manufacturing concerns; concerns manufacturing clay products; banks; brokerage houses; trust companies; coal mines, concerns manufacturing electrical apparatus; public service corporations, and a good deal of miscellaneous work that usually comes in our year's business.

Q. Have you established or assisted in the establishment of cost accounting systems for various mercantile and manufacturing industries?

A. I have assisted senior accountants who were preparing systems, preparing the ground for them and working with them. I have given quite a little thought to the matter, but have never as
3363 yet been in charge of an engagement where we were called on to put in a cost system.

Q. Are you familiar with the cost accounting systems that are installed by your accounting firms and other accounting firms, and the principles involved in them?

A. I have made some study of the matter and have had considerable discussion on subjects of that kind.

Our organization carries on a campaign of education for its staff pretty near all of the time. We get the best thought of the entire organization along these lines, and we think we keep fairly well up to date in that way.

Q. I wish you would state what relation you occupy to the present litigation?

A. When our firm was retained by the Railroad Commission of

the State of Arkansas to assist in investigating the statement submitted by the railroads in this matter, and to prepare figures to support the state's side of the case and secure the necessary data for that purpose, I was assigned to take charge of the field work in the matter for our firm. That is, I was placed in direct charge of the work in the railroad office.

Q. About when did you begin that work?

A. July of last year; I think about the 11th of the month, if I remember correctly.

Q. You have been a guest of the railroad offices, I believe, pretty continuously from that time down to the present time, have you not, Mr. Hamilton, and practically lived in their accounts?

3364 A. Yes, with one or two short intervals, that is true.

Q. Are you familiar with Exhibit 26, filed by the Iron Mountain Railroad, showing a statement of trans-state interstate and state freight handled within the month of October, 1907, and the statement in Exhibits 19 and 20, filed by the St. Louis Southwestern Railroad, showing ton miles of commercial freight handled on through and local trains in the state of Arkansas, and the revenue, divided between state and interstate, during the month of October, 1908, and the miscellaneous train statistics shown in Exhibit 20, for the month of October, 1908, on the Cotton Belt road?

A. Yes, sir.

Q. Are you familiar with the method of compilation and the results shown therein?

A. In the case of Exhibit 26, I have pretty largely verified the method which Mr. Roth stated he employed, and in the case of Mr. Kimbell's Exhibits, I am familiar with the way in which those figures were obtained, from hearing Mr. Kimbell state it. That was a train test made on the trains.

Q. I call your attention to Exhibit No. "I" filed by Mr. Wharton, being the freight statistics of October, 1907, on the St. Louis, Iron Mountain and Southern Railroad Company, and ask you if you are familiar with the same?

3365 A. I am.

Q. Did you compile this or was it done under your direction?

A. The exhibit itself was compiled under Mr. Wharton's direction, with my assistance, largely. That is, the making of the various calculations and the framing of the exhibit, but most of the basic data contained in the exhibit was compiled either by me or under my direction.

3366 Q. Now, Mr. Hamilton, take up that exhibit and give thoroughly and in detail, a history of the compilation and the methods pursued by you in reaching the results that are shown therein.

A. The first item on the exhibit is "Ton miles of freight carried" subdivided between local trains and through trains. We worked up the figures shown in the local train column.

Before explaining the method, I will say that that work was done by myself, jointly with the employés of the Arkansas Railroad Com-

mission, and at times some small assistance from members of the staff of Haskins & Sells, where we needed a man and could use one to advantage temporarily.

The bulk of the work, however, was done by Messrs. Wright and Dutlinger, and myself. We had some assistance from other employés of the Commission, but the major portion of the work was done by us.

Q. While you are on that and before you go into it further, Mr. Hamilton, I wish you would state, generally, the ability of these various men who assisted you in this work, and their experience and training to fit them for the work done.

A. Mr. Wright, who has been on the stand in this case, and who, I think, has given his railroad experience rather fully, I do
3367 not think needs much comment from me, except to say that in my judgment he is a very capable railroad accountant and a very thorough worker.

Q. He has had such experience as would enable him to do the class of work he did in this case?

A. Yes, sir. We found his local knowledge of the situation on the Iron Mountain in Arkansas was invaluable to us in getting these figures together, he having been close to the ground down there, as Traveling Auditor—I think for seven years—and knowing, as I recall he put it "all the landmarks along the road", was of great help to us.

I understand Mr. Dutlinger had some years' local freight office experience with the Iron Mountain road. I know this, of course, only as he tells me, but I think that the character of the work he did bears out his statement that he was well qualified for that class of work.

I understand that he was for some time located in the local freight office of the Iron Mountain, in Little Rock, and after that time was employed by Mr. T. H. Bunch as his traffic man, handling the railroad end of his grain business in Little Rock, and getting pretty closely in touch with the railroads of the state in that way.

We also had with us a Mr. Reichardt, whose services were largely in a minor clerical capacity. He copied figures, assisted in footing figures tabulated by us and did work of that character, for a short time.

3368 The real work of compiling these statistics, however, was done by Mr. Wright, Mr. Dutlinger and myself, with the occasional assistance of some of the Haskins & Sells men.

Q. Was Mr. Wright competent to do the work you imposed upon him?

A. I think very thoroughly so, yes, sir.

Q. And the men from Haskins & Sells' who worked upon this matter, were they competent to do the work imposed upon them?

A. Yes, sir.

Q. In other words, you regarded the staff that worked under you as competent to do the work that was done by them?

A. I think so, yes, sir.

Q. Now, Mr. Hamilton, detail how that was compiled, stating it in your own way and giving a connected and detailed history of it.

A. The first item on Exhibit "I" is "Ton miles of freight carried."

The first column on the exhibit gives the statistics for local trains. We worked up the figures that are shown in that first column all the way down the exhibit.

Q. How did you work them up?

A. Beginning with the ton miles of local and mixed freight trains operating on the Iron Mountain in Arkansas during October 1907——

3369 Q. How did you get them?

A. Why, it is quite a long story, how we got the ton mileage. That is the gist of the whole thing.

Q. I thought you were referring to taking exhibit 26?

A. No, sir. We classified between state and interstate in a manner that I will describe, for your information.

We first made an examination of the railroads' official timecards, which are issued solely for the government of employés, to ascertain what local trains and mixed trains were scheduled to run in the month we had under review, and between what points they were scheduled to run.

We next examined the dispatcher's train sheets. The dispatcher's train sheet is the report he makes daily to the Transportation Department, of all trains of all classes, moving over the piece of road within his jurisdiction; the dispatcher, of course, having sole charge of the movement of trains while they are on the road.

An examination was made to see what local freight and mixed trains had been annul-ed or canceled.

We first had the schedule showing what should have been run and then we examined the dispatcher's sheets to see what, according to his record, had not been run.

We did not finally accept the dispatcher's sheet as evidence that any local train or mixed train which did not appear on it,

3370 had not run, but we went further than that. Where a train was missing that was scheduled to run and the dispatcher did not show it had been run, and did not make the plain statement that it had been annul-ed or canceled, we had recourse to the wheel reports for that date, on that division.

Q. I wish you would explain the wheel report, if you have one here.

A. I think I can explain it better later on.

We went to the wheel reports made by the conductors on that division and examined them to see if, perchance, some train had been run to do local work, but not run under the local's regular scheduled number. Oft-times they run a train as an extra, under the engine number; for reasons known to the dispatcher he does not run it under the regular number. If we found such an extra train which, in our judgment supplanted the local, we took it as the local train serving that piece of road that day.

In determining that we ascertained first whether that local freight train had handled less-than-carload peddling merchandise, neces-

sitating stops from station to station, and whether it had made an extraordinary number of pick-ups and set-outs for carload business, more so than a through train would normally make. Finding a train of that character, we went still further to the pay-roll and time books (that was done later on, but was done eventually) to
3371 find that the crew had been paid the rate of wages which under the Company's contract should be paid a local train crew——

Q. You mean the Company's contract with its employés?

A. Yes, sir. We then determined that was a local train.

Now, to go back to your question about wheel reports:

The wheel report is the report which the conductor in charge—I speak now of freight wheel reports—in charge of the freight train, renders to the transportation officials of the road, as to what the train under his charge had done. In other words, it is a train performance sheet.

Q. That is the physical performance?

A. The actual performance of the train as reported by the conductor.

Q. That does not include the business, the freight that is hauled on it——

A. It includes some tonnage figures. Perhaps I can really tell you better by describing what it does include. It does not take in any revenue figures.

Q. That is what I had in mind: it takes in none of the revenue?

A. No, sir. It shows first the points between which the train runs and the district and division over which it ran; the name of the conductor in charge of the train; the number of the train; the engine number or engine numbers, if two engines pull the train or if they change engines en route; the names of the engineer
3372 in charge of those engines; the time of departure from and arrival at the termini of its run; also some information as to tonnage rating, estimated for the use of the operating department. I think that figure is used to estimate the percentage of its rating which the engine is hauling. It also gives the number and initial of each car in the train at any time during its journey, or during a train's journey; the kind of car—meaning by that whether it be a box car, a flat car, a furniture or stock car, etc.; the marked capacity of the car in tons, that is, its loading capacity; the station at which the car was taken by that particular train and the station at which it was left. (I am giving the basic information that the report affords). The conductor also inserts the car mileage between the points at which the car was taken and left and to amplify that he divides his car miles between loaded and empty cars—divides his car mileage between loaded, empty and work car miles. If he obeys instructions, he should give on his wheel report the weight of the contents of each car in net pounds, as shown by the way-bill. I believe that applies to carload business and that certain estimates are given him on the back of the wheel reports for merchandise, less-than-carload, he should show the tons gross—that is, the weight of the car and the load, supposedly the tare weight taken from the

side of the car and the billed weight of the car's contents, or,
3373 if the way-bill shows that the car has been sealed, the gross weight obtained on the scale, which includes the car and the load; he should show the contents of the car as indicated by the way-bill; the final destination as indicated by the way-bill (although in my experience, that class of information from a conductor does not amount to much); he should show the seals on the car, both sides and ends; that is, the seal protection applied by the agent loading the car or at some intermediate station as it became necessary.

Having that information, the wheel report gives the entire performance of the train.

Q. Have you a blank form of a wheel report before you?

A. I have one handed me by Mr. Johnson this morning.

Q. I wish you would file that as an exhibit.

A. This is a new form and is slightly different from that which was in use in 1907, but in no vital particular.

Q. If you can get one of the others later, I would prefer it: However, you may file this now.

The wheel report last referred to is marked, "Defendant's Exhibit A-1, T. A. Hamilton, 6/16/10, M. J. C." and is in the words and figures as follows:

For Exhibit "A-1", see Volume 9, page 5848.

3374 The WITNESS: I had explained how we had determined what trains were local trains before we began to analyze their performances in ton miles, and I digressed to explain what a wheel report was, as that was one of the bases on which we worked.

Having located the trains performing local freight service—and in fact, I included the mixed trains for freight service in the matter I have outlined—we took off an abstract of the conductor's wheel reports for those trains for the entire month. Our abstract included the number and initial of all full carloads, the stations at which each car was picked up and set out by the train; the ultimate destination of the car's contents as shown by the wheel report. We took that information, not because we believed it was absolutely accurate, but because we thought it would be of material assistance to us in running down the way-bills to cover the cars later on, and it proved to be so——

Q. You say they were not used for any other purpose: Did you not get some of your ton mile statistics and car miles from the wheel reports?

A. I did not refer to the wheel report. I said we abstracted from the wheel report what the conductors said was the ultimate destination of the freight; that information appears on our sheets and I just included it for that reason. We figured the car miles
3375 made by less-than-carload or package freight cars, direct from the wheel reports, taking the point at which the car was shown to have been picked up and the point at which it was set out by that train, and figuring the difference between based on the mileage shown in the Company's official station list, which I am informed is the basis of all their mileage statistics.

We figured the mileage of the empty cars in the same manner. The mileage figures for the less-than-carload and empty cars were entered by us on our abstract sheets in totals, for each train, each day. What I am getting at is this: we set up each individual full carload. We made no attempt to set up each individual less-than-carload or each empty car, and for the reason that we were not going to attempt to classify the less-than-carload freight between state and interstate. I will explain in a few minutes why that was. One empty car was the same to us as another. Therefore, we got the mileage of the less-than-carload and empty cars, and entered them in separate totals for each class on our sheets, for each day.

3376 After we had our sheets abstracted in that way, we started out to locate the waybills to cover the freight in full carloads; I have a copy of an Iron Mountain blank waybill.

Q. I wish you would explain fully what a waybill contains, what it is, and what its office is in handling freight?

A. This form I have here is the form for the billing of ordinary freight. There are other forms, cotton waybills, forms for red ball freight, live stock, and waybills of various sorts, and sizes, but vitally, this is the standard form of waybill used now by practically all railroads in the United States, so this will serve as a type of all the others, although there are some differences.

A waybill serves both the Transportation Department and the Accounting Department of a railroad. Its functions in the Transportation Department are to cover the transportation of freight on the company's trains. In other words, it is the conductor's authority, issued to him by the Company's agent, for the transportation of freight in his train. It is a rule on most railroads, that no freight shall be transported without a waybill, there are some variations of that to expedite traffic, but that is the general rule. The waybill, from the transportation point of view, shows where the shipment was billed from, and where it was billed to, how it is to be routed, to its destination, the car number, the number and initial of

3377 the car into which the freight is loaded, the name of the shipper or consignor, and other originating references, the marks of shipment, consignee, its final destination, description of the articles covered by the waybill, and any necessary classification conditions, or rules under which they are shipped. The weight of the shipment is also given on the waybill.

Q. Who makes out the waybill, and where does it finally go?

A. That comes in on the accounting side of the proposition. That is practically all of the data that is of interest to the Transportation Department; it fully describes the shipment to them, informs them what is to be done with it, its nature and weight, and gives them all the information necessary to have in its transportation or movement; that is the idea of the waybill. It is just like a ticket for a passenger, only the passenger is able to talk and take care of himself, and you have to make a waybill to take care of the freight.

As an accounting vehicle, it affords the general auditor of the company, his basis for ascertaining that the company is receiving

its proper freight revenue for shipments transported over its rails; all of the information which I have outlined as being useful to the Transportation Department is of interest to the auditor, necessarily so. He goes further, however, and interests himself in the rate charged for transportation of freight, as shown by the way-
3378 bill, sees that the proper rate is assessed which entails the proper classification of freight—that proper freight charges are collected by the company's agents, and that all accounting regulations for the transportation of freight and its accounting, are taken care of.

The waybill also furnishes the basis for practically all of the company's freight statistics; it is a history of the company's freight movement in detail. It is made out by the station agent, or his force at the station where the freight is received by the Company from the shippers or turned over, that is from the shipper or turned over by a connecting line or perhaps on the company's rails intermediate, where re-billing is necessary; it is made by the station agent, and in any event, it accompanies the freight to destination, except in a few instances, and becomes a basis upon which the receiving agent delivers the freight and assesses the freight on it.

Those are, in a general way, the functions of a waybill.

Q. Having digressed to get an explanation of waybills, into the record, I wish you would proceed with your method of work?

A. I want to add to that:

The waybill should give, after revision by the auditor, before it is finally taken into the company's revenue accounts, at
3379 headquarters, a pretty complete history of the shipment.

By the way, I omitted another function that the waybill has, while that is an accounting function, it affords the claim agent a basis for his investigation of freight claims.

Q. How does it find its way into the auditor's office?

A. The practice varies on different roads; on the Iron Mountain, the auditor gets an impression copy of the waybill, of all waybills made by his own agents, whether the waybill be headed to a station on his own line or headed under a through billing arrangement, to a station on another line, he gets an impression copy or he takes pains to see that he does if it is not sent in; he gets an impression copy of all waybills in which his line performs the intermediate haul, when the waybill goes over his rails, but originates and *and* terminates on other lines. He has in his possession, the original waybills covering all interline shipments, made on other lines to stations on his road; those waybills resting on his road are in his possession, those originating on his road, destined to his road, and over his road.

Q. The general auditor's office then, should contain waybills showing the movement of freight—every ton of freight—on its line?

A. Yes, sir.

Q. Either the original or an impression copy of the origi-
3380 nal, as the custom might be on different roads?

A. It necessarily must, if the company is to get revenue for the transportation of freight.

Q. Attach that copy as Exhibit B-1.

(Exhibit B-1 is set forth in Volume 9, page 5851.)

A. I will do so; it was those impression copies, or the original waybills, as the case might be, that we started out to locate, covering the cars we had listed in these local trains, and speaking roughly, I think there were approximately 24,000 full carloads on those trains, in the month of October, 1907, making it necessary for us to locate about that many waybills. I have not made any special count of it, except by the size of the abstract sheets, how full they were, and the number of lines, a line being given to a car.

When we set out locating the waybills, these I refer to, we first had recourse to reports of cars weighed on the company's track scales. Those reports are rendered to the general auditor by the weighmaster, in charge of scales. The scale reports on the Iron Mountain road, and the Missouri Pacific too, give the number of the car, the name of the station from which it was waybilled, and number and date of the waybill, and the station to which it was billed.

Now, the station from and to are not in all cases—accurate—I speak now entirely of the heading of the waybill; we proceeded on the theory that in accordance with the usual practice, the
3381 cars received scaling service, if possible, at the first track scale they crossed.

Q. Explain what you mean by "scaling?"

A. The scaling consists of placing a car on the track scale, and ascertaining the weight of the car and load, and then on the scale report, that is shown as the gross weight; the stenciled tare weight, meaning the weight of the car itself, as stenciled on the side of the car; that is deducted from the gross weight, and in that way, the net weight of the contents of the car is arrived at.

A car is usually scaled at the first track scale it passes over—not always, because it is not always practicable to do it. We proceeded on that theory, if we found it, al- right, we had the waybill. If we did not find the car on the first scale record, we followed it on the route that it would possibly traverse; it may have gone more than one way, over Missouri Pacific and Iron Mountain rails, and we examined the reports from every scale that it could have passed and endeavored to find who had made the waybill for it.

Failing to locate the waybill made to cover the cars in that manner, we next had recourse to the waybills made at the station where the conductor said the car was picked up by him, on the chance that the car might have originated there.

Failing to find that the case,—which would indicate that
3382 the car had not originated there, but came from another point, we examined the waybills made at Missouri Pacific and Iron Mountain stations beyond the point where the car was picked up in the direction from which it moved, endeavoring to find the waybill for the car in that way.

We also examined the junction reports made by the Iron Mountain agents, of cars received from or delivered to connecting lines at

junctions which the car could have passed on its journey, should it come from beyond the station where it was picked up.

Those junction reports—passing reports I believe they are called in the Iron Mountain auditor's office—give the car number and initial, number of and date of the waybill covering the car, billing station and station to which billed, also the car's contents, although that was of no moment to us; we were simply looking for the waybill number.

Some cars were found in that way. Failing to locate the cars in that manner, we had recourse to the auditor's abstract of waybills known as freight journals. On these freight journals, the auditor's office force compiles a record of the waybills according to heading; by heading, I mean, say for instance, from St. Louis to Malvern, the shipment might be destined to Hot Springs, but would be headed to Malvern, but the waybills to the stations on the Missouri Pacific and Iron Mountain systems, the waybill headed to those
3383 stations would be charged to the agent at that station, and it is necessary for him to collect the charges there. For that reason, the auditor groups these waybills according to the stations to which they are headed, and again groups them according to the stations at which they are made, in rough geographical order.

We had reference to these journals, which in a great many instances show the number of the car, enabling us to locate the waybills covering some of the cars we had on our sheets.

I might illustrate how we did that; if we had a car on our abstract sheet, which the wheel reports showed had its final destination at Little Rock, we might or might not find it on that record—in theory perhaps it was headed there; say a car was picked up at Newport, I would endeavor to find that car weighed on the Newport scale; failing in that, I would try to find it weighed on the Little Rock scale; failing in that, I would look at the billing at Newport station where the conductor got the car. Failing to find it there, I would proceed up the main line of the Iron Mountain towards St. Louis, and over the various branches of the road, looking for waybills; perhaps we went over the Missouri Pacific, if in our judgment we thought the commodity could have come from Missouri Pacific rails. Failing in that, we would go to these journals—I would go to the Little Rock Journal in this instance, and look to the group from Newport and see if we could locate that billing. Fail-
3384 ing in that I would go up north of Newport, looking through the journal for points beyond Newport. You can readily see how the grouping of waybills in that way, in geographical order, made it practical to trace the car back over the road it might have been traversed on its road to Little Rock. Of course, it is not always true, that the information given by the conductor that the car was destined to Little Rock is right; sometimes, that was a mistake, and we had to go to the journal south of Little Rock, all the way to Texarkana and Alexandria, or west to Ft. Smith, to find its destination.

All of these methods were an index to the number of the waybill

covering it, which enabled us to go to the waybill for the tonnage of any car and classify it accordingly.

On inter-line business, that is business which the Iron Mountain and another road handled jointly, we referred to the settlement sheets, settlements of account rendered by the foreign lines to the Iron Mountain; that was on business forwarded by the Iron Mountain to those lines.

If we found a car in a train and the conductor said it was destined to San Francisco, we looked on the Southern Pacific settlement sheet, knowing that was the way it would go, and in that way got the waybill number, and went back to the waybill for our information as to the tonnage, or if we found the conductor said it
3385 was going to New Orleans, the natural inference was it was turned over to the T. & P. at Alexandria—the Texas and Pacific. Failing to locate it on the junction report, we went to the account rendered to the Iron Mountain by the T. & P. That is what we refer to as the settlement sheets, such giving an index sheet to the waybill covering freight that the Iron Mountain has the originating haul on, or where the Iron Mountain had the intermediate haul between two roads.

We found too, in numerous instances, that the seal protection on the car, as shown on the conductor's wheel report, was a direct index to the station which had billed the car, and we were enabled in that case to go direct from the wheel report to the waybill covering. Explaining what I mean by seals on cars, it is customary to protect the doors and all the openings, not only the doors but all openings on all closed cars, with either lead or tin seals; that is, the door is sealed with a lead impression, seal, or tin seal, which locks the door, and in closing the impression seal, the impression on the lead seal, the station agent will impress on that seal, the number of his station, the seal die would have that number on it. For instance, in a local freight train running between Wagoner and Van Buren into Arkansas, we find a car on one side of which was a seal,
#4160, reported by the conductor, that being the number
3386 of Wagoner Station in the Company's official list; that would indicate to us, that perhaps that car had been loaded at Wagoner; we would go right to the Wagoner billing for a few days previous, and locate the car in a great many instances; a car might have been sealed 3930, Van Buren Station; we would go through the same process in the Van Buren billing, to find the waybill that covered the car. Very often, various seals, placed on the cars at different stations, were on various openings of the car, indicating there was only one door opened at the last loading station. When we found that, we went to all stations whose seals were on the car, unless they were so remote it was evidently a very ancient seal.

Having located all the waybills—I say all, there were some few we didn't—having located the waybills to cover the cars in this manner, we classified the tonnage, the weight of the shipment on each waybill, as between state and interstate; we made a sub-division of interstate into trans-state and interstate, but generally speaking,

we classified it between state and interstate. We did that as we located each waybill, so there was nothing to do but to lump it all, at the end of the process.

Q. You say there were some few of the waybills you didn't locate out of the month's business? How many were there?

3387 —. I haven't the exact figures here, and I would like to refresh my memory before I make a positive statement; not a great many though.

Q. Will you give us the exact number?

A. I will, yes, sir.

Q. Go ahead with your explanation.

A. Having classified our tonnage in each car between state and interstate, in the manner I have described, we proceeded to make ton miles out of it. Our abstract sheets show for each car, at that stage of our work, the number of the car, where it was picked up, where it was set out, its weight in pounds, divided between state and interstate. We took the information given, which was derived from the wheel reports as to where the car was picked up and set out, and figured the mileage between those two points: that is the mileage which that car and its contents travelled in that local freight train. We placed that mileage on our sheets, deriving it from the company's official station lists,—that typifies the process. Of course, it was an immense amount of work.

We then, to cut directly to the result, multiplied the weight of the cars' contents by the mileage made in that train, and in that way, got the pound miles *the pound miles* of state and interstate traffic on those trains; I speak now entirely with reference to the carload business.

3388 We reduced that by a single calculation, of course, to ton miles, that being, of course, the accepted unit for statistics of that character, being the easiest way to handle it.

That explains how we got the ton miles, state and interstate of carload business. Those trains also carried less than carload business, and as I stated previously, we made no attempt to classify that between state and interstate, and for a very good reason—at least it appeals to me as such. To begin with, although that had nothing to do with the reason, I think Exhibit 26 shows in the month of October, 1907, the month we were interested in, the total L. C. L. tons, state and interstate, and trans-state, handled in Arkansas by the Iron Mountain was but 5.77% of the total tons, and expressed in ton miles, that traffic was but 4.29%. The last line of Exhibit 26, shows those figures in columns 2 and 7; but the principal reason for which we determined not to analyze the contents of those cars, was this: We could not be at all sure that we had located all the waybills for those cars, and not being able to locate them all—I speak of L. C. L. cars—we did not try to locate any.

The reason it is impossible to locate all of those waybills—perhaps impracticable would be a better word—is this: It is a common occurrence at way stations out on the line, and I think it is a

3389 pretty good plan from the agent's point of view, to make waybills for his freight that is to go forward by local train or

any other train, but in this case, for local L. C. L. freight, before the train arrives; he does that so he may go out on the platform, help load the freight, help unload it, check it in and out, be on the ground to watch for damage to freight, and make the necessary notations on the waybill. He is busy on the platform and should be, unless he has a very large station with assistants to attend to this; he makes his waybill beforehand for that reason, and he takes his impression copy for the auditor's file beforehand for that reason, and having taken the impression, he does so without the car number on the waybill, because he cannot know in advance of the arrival of the local freight train, what car his package freight is going to be put in. Therefore, he omits necessarily, the car number from the waybill and from the impression copy; the alternative is, to make out the waybill, take the impression of it and let the local train stand there while the impression copies are being made, and I know from examining the original waybills in the Burlington statistical matter I spoke of a while ago, that of L. C. L. waybills made at way stations, fully 50% are without car numbers, unless it be a station of sufficient size to originate a carload of local freight, which would be loaded before the local came in. As we went through the im-
3390 pression copies furnished the auditor at the time, naturally the waybill had no car number on it because of that. Therefore, we did not attempt to classify any L. C. L. freight between state and interstate.

Q. How did you classify that?

A. We had worked up, as I explained previously, the car miles made by these package or L. C. L. cars, getting the total of that figure, we multiplied it by four, that being the average loading of merchandise cars in the Cotton Belt test, as on file here as Exhibit for the month of October, 1908.

Q. Multiplied by four—just give the figures to show where you got that four?

A. I would like to amend that statement I got mixed on it; that figure is shown in our Cotton Belt freight statistics, exhibit for October, 1908, and is the result of calculations based on Mr. Kimbell's Exhibit- 19 and 30, simply reducing the figures to the average loading for that class of car.

Q. That is, it is loaded four tons to the car?

A. Yes, sir, we took that figure which represented the average loading of such cars on the Cotton Belt and applied it to L. C. L. freight car miles on the Iron Mountain.

When I say average loading, the assumption there is that that loading was in the car upon an average, every mile that the
3391 car travelled, while it might have had ten tons to start and one at the end, still the average loading was that.

Q. From your examination of the Cotton Belt and Iron Mountain waybills, what is your opinion as to accepting the Cotton Belt figures and applying them to the Iron Mountain? Is there any differences in the conduct of that business between the two roads?

A. That would be a matter of opinion purely, because as I said, we did not analyze these Iron Mountain merchandise cars; we figured

on the Cotton Belt basis, which was the result of an actual test; Mr. Kimbell's men rode the train. It appears to me that with the grater density of traffic on the Iron Mountain, with proper economical management on account of that density, that it would at least load the cars as heavy as the Cotton Belt loaded them.

Q. If there was any error, it would be an error against the State?

A. Yes, sir. I had not quite finished my explanation of what we did. We got a total figure of L. C. L. ton miles on that basis, L. C. L. car miles, compiled by us as I have described, multiplied by this average figure of four, which was deduced from the Cotton Belt figures prepared by Mr. Kimbell, that gave us the total L. C. L. ton miles exclusively for local trains.

3392 We didn't know how much was state and how much interstate; we took Mr. Roth's exhibit 26, which shows that the total L. C. L. ton miles of state traffic was 459,204, that is line 8, column six, Exhibit 26, and we used that in making our Exhibit I. Every ton mile of L. C. L. intrastate freight shown in this exhibit, being placed on the local trains, and deducting that figure from the figure arrived at as I have explained, the car miles multiplied by four, said that the balance then was the interstate L. C. L. ton miles on the local trains.

I think that when we place all of the state L. C. L. ton miles on the local trains, we have worked an injustice to the state business, in compiling our statistics based on Exhibit I.

Q. What information have you on that, which makes you think you do an injustice to the state business?

A. My reason is this, that it is practicable to haul state freight in Arkansas a maximum of 305 miles—I think that is the correct figure, and the average local train run is about 1/5th of that, and I cannot conceive of railroad management that would permit package state freight, moving that distance, to work its way along in five local trains when it could move first in the local and be hauled in a through train between division points and then be peddled out.

3393 Q. You think there was some L. C. L. freight moved in through trains.

A. Yes, sir, supposing we had a shipment say from McGehee, on the Valley Division, 102 miles south of Little Rock, to Van Buren, I don't think it is conceivable under the orderly operation of a railroad, for that freight even if it passed Pine Bluff in the second local train, to pass Little Rock in a local; they would certainly unload it at Little Rock and put it in a Van Buren car and then it would move in a through train. At least, that would be good handling, in my judgment, of the shipment.

Q. What does the Cotton Belt test show on intrastate L. C. L. freight on through trains?

A. Approximately 20%, as I recall it. Exhibit #20 shows commercial ton miles L. C. L., that means revenue freight—I have been talking about revenue freight all morning—on the through trains. —this is all L. C. L.—80%, and on the local trains, 20%.

Q. Ten the Cotton Belt carried 20% of L. C. L.

A. Of all its L. C. L. business.

Q. On the local trains?
A. Yes, sir.
Q. L. C. L. state business?
A. The exhibit says commercial ton miles L. C. L.; the segregation is not made there; ton miles, L. C. L. of revenue freight, state, 17% on through trains and 83% on local trains; those figures are
3394 taken from Mr. Kimbell's Exhibit #20.
Q. Then instead of having 83% of the L. C. L. intrastate on the local train, you have carried 100% in the Iron Mountain exhibit, which you have made?
A. Yes, sir, we have loaded it all on to the local.
Q. And for that reason, you think there is some figure, whether it is 17% or some lesser figure of that freight, which should have been carried and was in fact carried, on through trains?
A. Yes, sir.
Q. But owing to your inability to get at that accurately, you have put the full 100% on local trains?
A. Yes, sir. It resolves itself into this, if that is an error and you take any of that state freight off the local and put it on the through train, and if by our estimate of four tons per car mile you give the local all the L. C. L. it carries, you would have to give the local train interstate ton miles to make up for the state you take off.
Q. Whatever error there is on that, it is against the state business?
A. Yes, sir, because you put more on it than is there, and our figures show that is the most expensive train.
Q. Proceed with the balance of your work there?
A. Having got at the ton mileage of local trains, carload and less than carload, interstate and intrastate, in the manner I have described, we deducted that figure,—that is this first column on
3395 Exhibit I, where it refers to ton miles, from the total figures of exactly similar character shown on Mr. Roth's Exhibit #26, those total figures assuming to show the total traffic on all trains for that period, for the period for which we investigated, deducting our figures from Mr. Roth's total figure, we said that the balance of the ton mileage was on the through trains, and we have shown such figures in the proper column of Exhibit I.
The next item on Exhibit I, that was a matter of investigation by myself and the gentlemen under me, comes under the head of mileage statistics.
The first item is car miles: I explained that at the outset, how we had to list each car—each loaded car— on our abstract sheets, and place the mileage against that, in order to make ton miles of the freight in the cars, and how we had figured the mileage of L. C. L. and empty cars from the wheel reports, the distance between picking up and setting out, as shown by the conductor's reports, reduced to miles by us on the basis of the company's official station list. I used those figures incidentally, in getting our ton miles except as to empties, so it was just a matter of totalling our sheets and taking off those figures and that total is the car mile total. That includes the total carload mileage revenue and Company freight,

total L. C. L. mileage and the total empty car mileage. It
3396 includes the mileage of any work equipment that may have been moving in these local freight trains, although there was very little of it.

Q. Take your next item.

A. The item of engine miles was figured on the basis of actual distance traveled by the engine, pulling the train between the stations, indicated on the wheel report.

When we had the wheel report before us, I stated that it showed the stations from and to which the train ran. That, together with the Company's official station list, gives us the mileage made by engines pulling local freight trains.

The caboose miles, it will be noted on Exhibit I, are less than the engine mileage. As an ordinary proposition, every freight train on the road, every train run, has a caboose as well as an engine, but there is a difference of some ten thousand miles, the caboose being less than the engine mileage; that is the caboose mileage on the mixed freight and passenger trains run by the Company during that month.

We are informed by a gentleman whose duty it is to compile statistics for the transportation department, statistics of that nature, that in their total equipment mileage figure, they include caboose miles in passenger equipment, on the theory that they serve the purpose of a baggage car, and that the mixed train could
3397 very well get along without a caboose, but that it would have to have a baggage car.

Q. You just accept that classification?

A. Yes, sir, for this reason, as you will see, we went later on to apply these local train figures against their total figures, and for that reason, my figures had to comply with the method in which they figured theirs. With that difference, caboose miles are figured on exactly the same basis as engine miles.

Train Miles in the case of the Iron Mountain—Local freights for October 1907—were synonimous with engine miles, for the reason, as we satisfied ourselves by checking of the wheel reports and dispatchers' sheets, that no local trains or mixed trains were double headed during that period,—that is, run with two engines—there were some dead engines, that is, engines not in service or without steam up, hauled in local trains, but that was not actual service movement as far as that train was concerned; it was just like any other Company freight; there was no double headers for that month, and therefore the train miles would be the engine miles.

Having ascertained the train, engine, freight car, and caboose miles of the local and mixed trains in the manner I have described, we deducted that figure or those figures from like totals,—that is from the totals of figures of like character in the company's statistics, covering all the trains, the result necessarily being to
3398 show the balance as the train and equipment mileage of the through train.

I might say in that connection, that those total statistics are compiled by the Transportation Department of the railroads, by

accounting districts, sections of the road, and they so report to the general auditor, and that a given number of those accounting districts make up the mileage in the State of Arkansas, the border districts co-inciding or running with the state line, and we totaled the district figures to get the total for the state, and balanced it in that way. That is the way we got our figures from which we deducted our compilation to get at the through trains, train and equipment mileage.

The number of trains run, as shown on Exhibit I, was arrived at this way; as I said before, we had abstracted the wheel reports for all these trains, all these local and mixed trains, and satisfied ourselves that those we had listed were all trains by reference to the records that I have described. We counted those trains from our sheets, and in that way, got the number of local trains run; then, we took the dispatcher's sheets, on which there is a column headed "through freight trains" and we counted the through freight trains for the month in that column on all dispatchers' sheets.

Now, there were some trains in that classification, which
3399 as I explained before, according to our ideas, were not through trains, but local trains, and we had determined they were local and so classified them, and so counted them with our local trains. Those trains we deducted from the through trains marked on the dispatchers' sheets and got the actual through trains; that is how those two figures were obtained,—the number of trains run.

The number of cars handled in and out of terminals, was ascertained by us——

Q. This says "terminals where yard engines are maintained?"

A. By terminal, I mean a station at which there was a yard engine maintained, the expense of which was charged, of course, to yard expense in the company's accounts.

We were furnished by the Transportation Department of the Iron Mountain, with a list of the stations at which switch engines were maintained during October, 1907, and my reason for selecting those points and no others was this: If a train came along and set out a car the switch engine was there and took the car off, and if a train came along and picked up a car, the switch engine had undoubtedly prepared that car for picking up and delivered it onto the passing track or wherever the proper place was, and those switch engines were there not only to do industrial switching in that particular yard, but to serve passing trains in that way,
3400 and passing trains could only be so served where there was a switch engine kept for that purpose.

Having been informed by the transportation department of the road where these engines were in the service, we took the wheel reports for the entire month, of all through and local trains running into and out of those terminal- or passing them on through, every time we found a car set out at an intermediate terminal by a through train, we charged that as terminal handling of one car by through trains; if we found a car set out by a local at one of these stations, we charged that to the local; we charged that as a

car handled by the yard engines in terminals for local trains, if they picked up a car there, either class of train, through or local, we charged that to them; there was that much service rendered them, expressed in terms of cars handled. Where a train left a division terminal, whatever was the terminus of its run—say a through freight train of forty cars, we charged that through freight train with forty cars out of that terminal; if it took forty cars into the other end of its run, we charged it with forty cars into that terminal. Wherever a through train or local train set out a car at a way station, where there was no switch engine, of course, there was no switch engine expense incurred; that was that much more expnse of that particular train, and we did not take into account such cars, only where engines were kept; that is how those figures were compiled,
3401 covering the entire month and all the trains.

Now, that covers all the basic figures in that Exhibit I; on the Iron Mountain, the percentages and other figures shown are the result of internal calculations based on figures I have explained the compilation of. In the case of the Cotton Belt, still on the freight side of the house, their statistics being for October, 1908, the ton miles, car miles, caboose miles and engine miles shown in our exhibit, were obtained from or based on, Mr. Kimbell's Exhibits 19 and 20.

The number of trains run, both through and local, was furnished me personally by Mr. Kimbell, Assistant General Auditor of the Company, and was obtained by him at my instance, at my request, from their Transportation Department, whose records are kept in Tyler, Texas, and were not accessible here. The figures furnished Mr. Kimbell were turned over to us.

The number of cars handled in and out of terminals, was worked up on the same basis as the Iron Mountain figures, except at the stations at which switch engines were maintained, that was determined from a circular in Mr. Kimbell's possession, which gave that information, and we agreed on that point, I think. And the basis of our figures was not the wheel report, but a copy of it made by Mr. Kimbell's employees, in getting together his Exhibit #19. It served our purpose amply as well; I saw no reason to doubt its accuracy, and so adopted it.

3402 The figures were compiled in the case of the Cotton Belt generally, by Mr. Speed, an employee of the Cotton Belt office whom Mr. Kimbell assigned for the purpose, Mr. Wright and myself, my share of the work being very small. We merely discussed ways and means, and I went back once or twice to see that my instructions were being carried out; the figures made by Mr. Speed and Mr. Wright were agreed upon, I think, and the other figures shown in Exhibit #P, are the result of calculations based on the figures I have referred to.

That takes care of the method of obtaining the figures shown on Exhibits I and P. There are some other figures in these exhibits, which Mr. Wharton referred to in his testimony, as having been gotten by me or under my supervision——

Q. Take those up and explain them.

A. The item of mileage of yard locomotives, which is given on page 2 of Exhibit K is 130,150 miles, was taken direct from the company's statistics; the figures were furnished me by Mr. Aoumock, who is chief statistician in the office of the car accountant of the Iron Mountain road; they were furnished to me as being the mileage of switch engines, compiled on the basis laid down by the Interstate Commerce Commission, and exclude, I am informed and as I believe to be correct, the mileage of entire switching performed by local freight train engines out on the road, at way sta-

3403 tions.

Wages of road enginemen and trainmen, shown on page 5, Exhibit K, amounting to $29,229.30 for local trains, that includes 75% of the pay of mixed train crews, that being the basis adopted by the Company reflected in its figures submitted here for the segregation of mixed train expenses between freight and passenger. This figure, $29,229.30, wages paid local freight train crews, and proportion of wages paid mixed freight train crews, was arrived at by us, by myself personally, in the last analysis, by examining the time books of the railroad company in which an account is kept with each individual employee on each division, showing the service performed by him each day, local freight, through freight, passenger, switching, etc. Those time books were sent in from division headquarters of the road for our convenience, and were examined by us in St. Louis. We had before us copies of the company's contracts with its trainmen, and were thoroughly informed on the subject of trainmen's wages before we began the investigation, and our figures are the result of the compilation of the mileage and time allowed the men in local freight train service, as shown by the time books, applied to the stated rate of pay, which by the way, is also indicated on the face of the time book for each class of service, and the total of the amounts so obtained for each train for the month, gives us the figure for all the trains in

3404 this manner.

I might say that our guide—there is something there that requires explanation—our guide to the employees in the time book was, to begin with, the wheel report; the wheel report showed the engine number; we could locate the engineer on that day by his engine number, the engineer's time being kept in separate books, showing that on that day, he ran on engine so and so; sometimes the train number was given, sometimes not; it should have been given; but in many cases it was not. That located the fireman for us in the same way, in many instances; there were few cases where the engine number did not appear opposite the fireman's name; in those where it did not, we assumed that the fireman made the same time as the engineer; it is true that he might have made more or less, but we assumed that he made the same time, and was paid at the standard rate of pay for the class of engine he was firing.

We located the conductor by name, his name appearing on the wheel report; we located the conductor by name, found what his day's pay was, and charged it to that local train.

The company's contract calls for three brakemen on local freight trains. We located the brakemen in the time books by the conductor's name; as a usual thing, they were shown as running with a certain conductor; where that information was lacking, as it was in some instances, we assumed that there was hardly any-
3405 thing that the brakemen could do on the train that was chargeable to the train service, when the conductor would not be present, so we gave them the conductor's time, with the brakeman's standard rate of pay. I cannot conceive what the brakeman would be doing in the train service except under the supervision of the conductor. In that manner, we came at our local freight train figures.

Those figures were applied against the total wages of enginemen and trainmen, shown by the company's books, speaking of Arkansas figures always, for that month, and the percentage which the local wages was of the total for the six months' period for wages of enginemen and trainmen was obtained, the figures being shown on the company's books; that is, we divided the six months' figures on the basis of the actual location of wages for the month of October, assuming that the service would be relatively the same, and the amount of wages would be relatively the same.

Then we have loss and damage of freight, which I think is the next item. We examined the vouchers, and where necessary, the claim papers on file in the office of the auditor or freight claim agent—on file in the office of the auditor, for all loss and damage freight claims any portion of which was charged to the State of Arkansas by the Railroad Co. during October, 1907.

We examined the voucher for information as to whether the freight lost or damaged and so paid for, was state or inter-
3406 state freight; information as to the movement of the freight and necessary data to so classify it was given in those papers. In fact, we examined the claim papers. The necessary basis for a claim is the paid expense bill or bill of lading, which would still further give it, and copy of the waybill would again give it, and in many cases, the voucher gives it, and in that way we ascertained those figures.

Q. That was the actual amount paid during the month?

A. Yes, sir.

Q. How did that conform to the amount paid during the six months' period?

A. In total, the charge for loss and damaged freight,—I speak now of the total state and interstate together, for the month of October, 1907, shown by the exhibits in this case, was $19,927.58. but $72.42 short of $20,000, and the figures for the six months was $127,000 in round figures. That is just a trifle over a thousand dollars a month more, on the average, than the October figure was. October is pretty nearly one sixth——

Q. It lacks nearly $1,000 in round numbers, of being one-sixth of the total of that item for the six months' period?

A. Yes, sir. On the Cotton Belt, taking up the roads interchangeably, as I strike each class of items—loss and damage to freight

figures were arrived at from the company's records, in practically the same manner as that I have described on the Iron Mountain.

3407 The mileage of yard engines, shown on the Cotton Belt statement, page 2 of the exhibit, namely 7507 miles, was furnished us by Mr. Kimbell, being secured by him at our request from his transportation department at Tyler, Texas, where such records are kept. The road enginemen and trainmen's wages, as is already explained, is an actual division of that expense between local and through trains for the month of October, 1908; it was made by the company, Mr. Kimbell's test, and we used his figures; I just mention that because it has already been explained on the Iron Mountain.

On the passenger side, the only figures there that was compiled by me, that I think need explanation as to the method of their compilation, are the carmile figures.

Car miles passenger—speaking of the Iron Mountain now—used as the basis for division of expenses of passenger service between coach, Pullman, mail and express service, are the result of the analysis of the Company's regular statistics, the mileage of baggage, dining and parlor cars, owned by the Railroad Company, being included by us in the mileage of coaches.

We did that, because we considered that these baggage, dining and parlor cars were either passenger carrying cars or auxiliary to the passenger cars, as they necessarily are.

3408 The wheel reports of the passenger train conductors are considerably different from those of the freight train conductor; as a matter of fact, they only give information in the rough as to the cars they haul. Of course, they give the engine number and so forth, the cars they haul, and where they haul them from and to, the reports of the passenger train conductors showing the equipment of each train and from and to what points it was hauled, were examined by us, for all passenger trains hauled in Arkansas on the Iron Mountain for October, 1907, and the car miles of each class of equipment obtained therefrom. It is the same principle, applying the mileage to the haul between the points indicated on the wheel report, our analysis in detail agreeing in total with the company's statistics; that is, their classification did not have quite the sub-divisions we wanted; we took the wheel reports, showing what class of equipment each car was, and we re-analyzed these figures and balanced it against their totals, in that way; they lump together—I forget the exact classification, but it is not as detailed as ours; it includes in one classification some items we have set out separately.

Q. But your detail corresponds with their general statements?

A. Yes, sir.

3409 In making our analysis, we have divided the combination cars used in two classes of service, on the basis of the lineal feet of floor space ordinarily used in each class of service, namely, mail, baggage, express or passenger car.

The number of lineal feet used in mail service, or which the Government was entitled to use, under its mail contracts, on each

road or train was furnished us by General Mail Agent of the Iron Muntain Railroad, Mr. Mack; the number of lineal feet of lineal space ordinarily used in express service, or which the express company was entitled to use, was furnished us at the request of the railroad company, and along lines laid out by us, by Mr. Guentsch, General Superintendent of the Pacific Express Co., which operates over the Iron Mountain Rails.

The number of lineal feet of space used in baggage and passenger service,—I am excluding now for illustration's sake, mail and express where we had actual figures or approximately so as to the space used, or which could be used,—the number of lineal feet of space used in baggage or passenger service, was estimated by us in the case of combination cars, carrying no mail or express, as 50% to each class of service; that is, in that car, that was half coach and half baggage, or partly coach and partly baggage; it was there for two purposes, to haul baggage and transport passengers; if there was two or three more feet in the baggage space or in the coach space still in our estimation the car ran 50% and 50% for passenger and baggage.

3410 The combination cars carrying baggage, mail and passengers, these we used for the mail, the lineal feet of space in the car which Mr. Mack said would be used for the mail service, and divided the balance baggage and passenger, half and half.

The same was true in the case of baggage, express and passenger; we set out the definitely known express space, and divided the balance half and half.

Cars used exclusively for baggage or exclusively for mail or exclusively for express, were charged direct to each service.

Cars used generally for baggage and express, were charged half to express service or the part to which it was entitled, whatever it might be, as advised by the express company, and the rest was charged to baggage.

Illustrating what I mean by that in this way, take a car running 300 miles, and determining on the basis I have outlined that half of it would be charged to express and half for baggage, that meant in our statistics 150 express car miles, and 150 baggage car miles, half the car the whole distance for each service, or take a car, the combination car, running 300 miles, used generally for baggage, express and passenger service, and determining on the basis I have outlined, that one-third of the space in the car should be assigned to each class, that meant in our statistics, 100 car miles passenger, 100 car miles baggage, and 100 car miles express, one-third

3411 of the car three hundred miles.

On the Cotton Belt passenger statistics, I made figures personally from wheel reports, which were sent in for me from Tyler, Texas, and while I did not have there the information that I had on the Iron Mountain as to the mail routes and express routes, I consulted with the employees of Mr. Kimbell's office, who were familiar with the matter, consulted the equipment guide, saw what were mail and express cars and so designated, saw what the conductor said they were, used for, mail and express or baggage and express, and in

that way, classified them. There were so few combination cars that I contented myself with that method of classifying them, which I believe is very nearly actual.

One other item that I had overlooked in going through this matter, as distinguished between it and the figures in Exhibit K, Mr. Wharton referred to a consultation in which we jointly determined on treating the engine as two and a half cars; I think it is under the head of maintenance of way, and as I recall it, he was asked if he weighed any engines; we didn't as far as I know. The basis for that figure, as I recall our conferences, and he conferred with me in the matter, was this:

A great many Iron Mountain engines are 12 wheelers, by that I mean, the engine would have four drivers on each side, mak-
3412 ing eight; two pony truck wheels, the pony trucks being the small trucks in front of the engine, making four more, which is 12, and the tank, or tender, as it is sometimes called, with eight wheels, making on an engine and its tank, 20 wheels; it is well known that the average box car has eight wheels; therefore, there are 2½ times as many wheels on the engine as on the box cars.

Some engines are ten wheelers—a great many in service in Arkansas are that way, but the relation would not be much disturbed by deducting those two wheels.

That is what guided us in that, with some suggestions that I heard advanced by some very eminent railroad men along that line, in discussing contracts for division of expenses of maintenance of joint track, on the so-called wheelage basis; it was suggested that it was quite the usual thing to treat an engine as 2½ cars, and that is practically the reason for the basis we assumed.

3413 By Mr. HILL:

Q. Are you familiar with the Cotton Belt test of October, 1908?

A. Exhibits 19 and 20, yes, sir.

Q. In what way is that made up, and wherein does it differ in its composition, from the test you made of the Iron Mountain for October, 1907?

A. I understand—I have no personal knowledge on the subject—I understand from what Mr. Kimbell has told us, that the method of securing the information shown on Exhibit 19 was to place men on the local freight trains of his line in Arkansas, for the entire month, whose duty it was to examine all the waybills for all the freight carried on the train.

Q. You mean the local, or all the trains?

A. All the local trains, and make an entire record of the trains' performance as it is detailed in these exhibits, but in the case of the through trains, he posted men at division terminals, I understand, and had them perform that character of work there, obtaining information from the conductor as to any cars that might have been set out in transit.

3414 Q. Wherein would that means of information be different from making those reports from the auditor's office?

T. There is this dierence—in so far as the less than carload busi-

ness was concerned, it was possible by Mr. Kimbell's method to make an analysis of that and divide the ton mileage between the various classes of state and interstate business, but in so far as the carload business is concerned, inasmuch as the men riding the trains and at division terminals, got their information from the way-bills, they were no better situated to obtain the desired information than we were, having access to the impression copies of those waybills in the auditor's office; in fact, it is extremely probable, that in a few instances, the information we got was more nearly actual for—I speak now of local trains—as far as tonnage was concerned, than that that was gotten by riding the trains, and for this reason:

That the men handling the waybills on local train, if the car had not passed over a scale, he would only have the billed or estimated weight, whereas, when we got hold of those things, in the majority of instances, those corrections had been made, and the actual weight applied to the waybill.

Q. That should have been corrected before, it went to the auditor's office?

A. No, corrected in the auditor's office; I a mnot positive about that; Mr. Kimbell's statement may have been adjusted to actual scale weights, but that point occurred to me.

3415 Q. Mr. Kimbell, was that corrected in the Auditor's office, after your men had obtained the information from the trains?

Mr. KIMBELL: It was, yes, sir.

WITNESS: On the item of wages, there would be no difference between the two statements. I am not clear whether Mr. Kimbell's figures are made direct from the time slips or time books, but in either case, the result would be the same.

In the matter of fuel, I understand that Mr. Kimbell's figures were made in this way: That his enginemen took an estimated inventory of how much coal was on the tank at the beginning of the run, kept track of the coal received at coaling stations during the run, and also made an estimate—which I believe they were quite competent to do, knowing the size of the tank—the amount of coal at the end of the run, and in that way got at the consumption for the run.

We endeavored to approximate that on the Missouri Pacific in this way: We took the—we asked the Transportation Department—I made a request in person of Mr. Jewel who was Chief Clerk at that time to the General Manager or Assistant General Manager—I am not quite clear on that point which it was—I asked him to furnish us the fuel tickets; it is the practice on most roads, and I un-

3416 derstand it is on the Iron Mountain, to have the engineer sign a ticket for coal at the coal chutes, for the amount of coal delivered to them, so many tons; we thought those tickets would have given us a very close approximation of the actual fuel consumed, weighing the coal on the tanks at the beginning of the month and the end of the month, but those tickets were destroyed, not available, and we did not pursue that any further.

Q. That is, for your period?

A. Yes, sir.

Q. I believe it is already in evidence, that you accepted the relative proportions between local and through as developed in Mr. Kimbell's test on the Cotton Belt?

A. Yes, sir, I believe so. Mr. Wharton and I, in our consultations about that, construed Mr. Doddridge's testimony to mean that the fuel conditions would be about the same on the two roads, and, therefore, applied Mr. Kimbell's figures, or figures deduced from his, which show that the fuel consumption on the local, per engine mile, was about 3½% in excess of the fuel consumption on through trains.

Q. Then the only practical difference in the method pursued between your test and Mr. Kimbell's, was that he carried forward his test into a separation of the L. C. L.——

A. As between state and interstate.

Q. Which as you explained yesterday you didn't do?

A. Yes, sir. There are a great many other statistics here that we did not attempt to compile—shown on Exhibit 20, such

3417 as the dead weight——

Q. I am speaking of actual figures you reached; each of you went to the way bills, that was the basis for both of you?

A. Yes, sir, in so far as the ton mile figures; the labor figures and fuel figures, that is a comparison between the two methods; there were other statistics which we could not get without riding the trains.

Q. Does Mr. Kimbell's exhibit show that he took the actual figures on loss and damage to freight?

A. Mr. Kimbell's figures simply give you the total loss and damage in Arkansas, for the month.

Q. I mean a separation between state and interstate?

A. No, sir, I understand it was divided on the revenue basis.

Q. You went ahead and made an actual division by investigating the claims actually paid?

A. Yes, sir, and when necessary went to the claim papers.

Q. How many cars were included in his month's test, including interstate, trans-state and intrastate?

A. I don't know how many cars—I can tell you how many trains there were.

Q. I thought his exhibits showed.

A. Not the number of cars; I don't so understand; it gives the car miles.

Q. Have you got the number of trains?

A. Yes, sir.

3418 Q. How many were there?

A. It is not shown in Mr. Kimbell's exhibit, but it was furnished to us by him, having been obtained from his Transportation Department records at Tyler, Texas. The figure was 450 local freight trains, and 639 through freight trains, total of 1089 freight trains.

Q. How many freight trains did you work up in your month's test—local freight trains on the Iron Mountain?

A. On the same basis, 1116.

Q. His included all trains and yours just the locals?

A. Our exhibit shows also the through trains obtained in the man-

ner I described yesterday; our local figure is 1116; the Cotton Belt local figure is 450; the Cotton Belt local and through is 1089.

Q. Mr. McPherson testified in this case, (page- 343-4, vol. 1, printed record.)

"Strictly speaking, no part of the yard organization cost, nor of the service of switching engines, is chargeable to trans-state traffic.

"There is nothing to be done with trans-state traffic passing through the State but to give it straightaway movement. The trains must be broken up at these division terminals, incidental to taking off the state and interstate traffic, as may have its destination at such points, or, on lines radiating therefrom.

"To increase the efficiency of operation and give the potential tonnage to locomotives, other cars must be added and these may
3419 be intrastate, interstate or trans-state cars. This brings about, of course, the physical handling of this trans-state traffic in these classification yards, and at times other trains may pick up trans-state traffic that has been set out because of blockade, embargo or some disarrangement of the orderly course of procedure, such as wrecks and washouts. This, however, is not due to any requirement of the trans-state traffic. It arises from physical conditions in the State of Arkansas; either from floods, casualties, or other disturbances of the orderly movement of businss."

Mr. Doddridge on page 12, vol. 2 of the printed record, referred to trans-state freight being transported across the state as upon a bridge.

I will ask you if you have made any investigation from the records, of the facts in regard to this theory upon which these gentlemen have spoken, as to trans-state business passing through the State as upon a bridge, and if you can, give us the results of your investigation upon the facts, as opposed to the theory upon that subject?

A. I have here a record of about three thousand cars, 1454 in October, 1907 and the balance, 1560 in March, 1907, a spring month and fall month.

Q. Describe how you got at that movement and the result of it?

A. In endeavoring to see just how long it took this trans-
3420 state freight to go through Arkansas, and how long it was on the company's rails, in Arkansas, in completing its journey across the state, and how long it remained inside of the state, we had recourse to the waybills for what we thought were typical movements of that character of freight. That is, we took in the October month, billing from Texas roads, going to the Iron Mountain at Texarkana, and moving via Little Rock and Van Buren and on out into Oklahoma and beyond, destined to Kansas City points, in that territory or beyond.

We took the movement from Louisiana, crossing the state line some distance below McGehee, and leaving the state five miles above Van Buren, destined to Kansas City and points in that territory.

We took the movement from Memphis, via the Memphis division, main line and the White River division, the last terminal in the state being Cotter, going to Kansas City and points in adjacent territory.

We took the movement from beyond Texarkana, straight up the main line into Missouri, the last terminal in Arkansas being Hoxie.

We took the movement originating in Louisiana and moving via McGehee, Little Rock, Hoxie and into Missouri, and the movement originating at Memphis or beyond, moving via Bald Knob, Little Rock and Van Buren, and so out of the state to Kansas City and adjacent points. By the way, that movement from Texar-
3421 kana to Hoxie, if I said that was headed to Kansas City, that was in error; it was to St. Louis.

We took the movement southbound from the White River Division, main line, Little Rock, and out into Louisiana by the way of McGehee, that being the last terminal.

The movement from Van Buren, coming from beyond, and going out into Louisana through McGehee.

The movement coming down the Main Line from Missouri and going off into Texas at Texarkana.

The movement from Missouri and beyond over the White River Division, Main Line and Memphis Branch, to Memphis and beyond.

We went to the billing without knowing where we were going to find the movement of the cars, abstracted all the cars for a period of fifteen days, then traced the cars into the first terminal in Arkansas, and out of the last terminal in Arkansas, most of them being very close to the border, because the only record we could get was at the last terminal.

The record we have of their movement is actual, it is taken from the wheel reports, showing the movement in trains into the first terminal, and the movement out of the last terminal; the intermediate time was spent in Arkansas.

All those cars, on the movement from Texarkana through
3422 Van Buren, a distance of 298 miles, the schedule time for which movement, linking up the through freight schedules, without any terminal delay, is 28 hours.

Q. Where did you get that?

A. From the company's official time cards for the ordinary freight. The company classifies its trains between Red Ball, Green Ball and ordinary, and this is the slow time.

On that movement, there were 100 cars, which consumed in total, 1477 days, on an average of 14.7 each; some of the cars might have gone through quicker, some took a longer time; in fact, our detail shows it did; it amounts to the same thing whether one car spent 14 days or one hundred cars spent 1400 days. The lost usage of cars is there just the same.

Q. What was the excess over the 25 hours which the cars visited in the State of Arkansas?

A. 14 days—about 12 days, lacking 4 hours.

Q. They found the climate inviting down there on their transstate flight?

A. I don't know as to that; this is what the wheel reports show on the movement through Louisiana and McGehee and Van Buren, a distance of 256 miles, the schedule time for which, on the same basis

as I mentioned, was 26 hours; a movement of 28 hours consumed in total 340 days, an average of 12 days per car.

Q. Without going into too much detail, what did that dif-
3423 ference in run make?

A. On the 1454 cars?

Q. No, on that particular item?

A. The difference was practically 11 days, less two hours.

Q. You don't catch the point I want; one would be delayed two days, and one 20 days, something of that kind, just give us a few instances of the two extremes, the longest and shortest and then give us the average, I don't want too much of the detail, but I want some of it.

A. One car got through in three days, and 7 cars got through in 4 days.

Mr. MOORE:

Q. Can you give us the number of the cars as you go along, so they can be identified?

A. That detail is available; I cannot give it right now; I can get the car number, if you desire, the time, date and the hour in and out of the state and the train numbers; I have it but I haven't it with me.

I found one car consuming 3 days, 7 cars, 4 days, 3 cars taking nine days; four cars taking 25 days, one car 43 days.

Q. Just give us a few illustrations, I just want to see how they were running?

A. That is the movement between McGehee and Van Buren, which were the first and last terminals; the movement from Memphis and beyond, going out of the state through Cotter on the
3424 White River Dixision, a distance of 240 miles, the schedule time for an ordinary freight train, the entire distance, is 23 hours.

I find 134 cars consumed 772 days, an average of five days per car.

Q. Against what is the schedule?

A. A little less than one day, 23 hours; we have one car that got through in one day, 28 cars that got through in 3 days, 12 cars in 9 days, six cars that took 14 days, one car that took 22; there were other cars.

Q. That is the division—we had some testimony that those grain trains went through like greased streaks of lightning.

A. Yes, sir. I might say in that connection, in locating the billing for the White River Division, that is the division we speak of, for October, 1907, and on some of their local trains in the state, we found a great deal of that wheat moving on local trains.—I say a good deal, I haven't the number of cars, but it is obtainable from our memoranda.

Q. When that export wheat came through on local trains, it didn't go through like a greased streak?

A. No, sir, it couldn't when it got on that local run.

Moving from Texas, through Texarkana, and up the main line

through Hoxie into Missouri, a distance of 264 miles, I am giving the distances between the first and last terminals in the state,
3425 and not from state line to state line.

Q. Some of those cars might have gotten lost after leaving the terminal?

A. Yes, sir, but these are pretty close to the state line, and I suppose they got across.

264 miles, Texarkana to Hoxie, schedule time for ordinary freight trains, 27 hours, movement of 166 cars, consumed 932 days, five days per car, and between Texarkana and Hoxie are but two through freight divisions, through freight trains should run, Texarkana to Little Rock, and Little Rock to Hoxie. That would indicate to my mind that the schedule time of 27 hours for two through freight divisions, where five days were consumed by this number of cars, that they must have been in a yard some place, or a passing track.

Q. They would hardly be on the main track during those five days?

A. Not if they ran any other trains.

Q. I understand the main track was about all this trans-state freight needed?

A. The figures speak for themselves.

The movement from McGehee, by Little Rock, and through Hoxie into Missouri, a distance of 221 miles between McGehee and Hoxie, schedule time for ordinary freights, 35 hours; 98 cars consumed 635 days, an average of 6 days per car. McGehee to Little Rock is one through freight division, and Little Rock to Hoxie is another; the same remarks would apply there as on the Texarkana-
3426 Hoxie movement.

Q. Add a few of the shortest and longest movements as you go along?

A. From Texarkana to Hoxie, where the average was 5 days per car for 166 cars, I found that made it on the schedule, got through in time.

Q. That was one of Mr. McCutcheon's onions?

A. I don't know the contents of the car now; I found 46 cars that got through in 2 days, 20 cars in 4 days, and 43 in 3 days, 14 that took 5 days, 3 that took 23, 2 that took 25, and 1 in 66 days,—that car must have been in bad order.

On the movement from McGehee to Hoxie, 98 cars an average of 6 days apiece, I find 10 cars made that run in 2 days, 27 in 3 days, 18 in 4 days, 2 of them in 14 days, and the maximum is one car which consumed 56 days, and the one immediately preceding that, being 1 car in 34 days. The movement from Memphis to Van Buren, a distance of 305 miles, via Bald Knob and Argenta, schedule time 31 hours, 25 cars 195 days, average of 7 days per car; I find that out of those cars, that 5 took 4 days; that is the minimum, 4 took 5 days, 5 took 6 days in transit; the maximum was 1 car 16 days; ranging from 4 to 16 days or an average of 7 days.

I might say, in stating those averages, that we dropped the fractions; that really figures 7.8 to split hairs on the proportion; it might really be called eight.

3427 Moving in the opposite direction, from north of the Missouri-Arkansas line, via the White River Division, via Bald Knob and Wynne and McGehee out into Louisiana, and beyond, a distance of 281 miles from Cotter to McGehee, the schedule time for ordinary freights is 39 hours; I find 138 cars consuming 930 days, or an average of 6 days per car.

Q. That is the greased streak of lightning road I believe?

A. That was the way export grain you refer to was handled, that is, if it was off the White River Division.

Q. I think there was some testimony that that was the route it used.

A. I find the minimum was 4 days, 8 cars consuming that much time; 32 cars, 5 days; 38 cars 6 days, 31 cars 7 days, 9 cars nine days, 1 car took 23 days, moving southbound between Van Buren and McGehee, originating beyond Van Buren in Oklahoma or beyond and destined to Louisiana, a distance of 256 miles, schedule time 22 hours, I find 291 cars consumed 2004 days, an average of 6 days per car.

Q. That is on October?

A. Yes, sir, still on October; the minimum on that movement was two days, between Van Buren and McGehee, 2 cars consuming that much time; 28 cars 3 days, 73 cars 4, 41 cars 5 days, 45 cars, six days, going up, 21 cars nine days, 13 cars 11 days, runs
3428 on up to 12, 14 days, up to the maximum of 32 days consumed by one car.

The movement from Hoxie to Texarkana, originating in Missouri, destined to Texas a distance of 264 miles straight main line over two through freight divisions, schedule time in that direction, 24 hours; 216 cars consumed 670 days, or an average of three days per car, or exactly three times the schedule time—24 hours. In that movement, is included 14 cars that got through on schedule time, 86 cars took twice the schedule time, 76 that took three times, and 22 cars that took four times, speaking in round numbers; the maximum was one car consuming 19 days; that car was perhaps in bad order.

From Missouri and beyond, via White River Division to Memphis and points beyond, that should come from Cotter to Newport, on the White River Division down the main line to Bald Knob, across to Memphis, a distance of 240 miles, schedule time 24 hours; 258 cars consumed 823 days, an average of three days per car; in that movement, we find 55 cars that got through on schedule time, out of 258; 76 cars took twice the schedule time, 45 cars took three times the schedule time, 37 cars took four times, and the maximum time consumed was 15 days by one car; that is the October movement.

Q. Have you a summary of the October movement there?

A. Yes, sir, totalling it all, 1454 cars, averaging 6.03 days, in round figures six days; the schedule time averaging it all, would have been 1.1 days per car; it consumed almost five days in excess of the schedule on the average.

3429 Q. I reckon those cars liked Arkansas pretty well, when they got down there.

A. That is the detail of the movement.

Q. I believe you stated you took those as you came to them?

A. We took the trans-state billing to and from certain territories, with no previous knowledge of how the stuff moved; we took all the billing for the period we examined.

Q. It is not just selected billing, but all of the particular period, from particular points?

A. Yes, say we took the Kansas City waybills to Texas, or from Texas to Kansas City, we took the whole bunch in that book.

Q. There was no selection, you just took the territory as you investigated it, as you found it?

A. Yes, sir, we took the tissue book and took all the waybills we found in that book, for instance, for the Kansas City territory.

Q. And without making any selection of the waybills?

A. Yes, sir.

Q. Give us the March movement, it was made the same way, I presume?

A. Yes, sir, we took a spring month for comparison with a fall month; I find that while I have the recapitulation for March, I haven't it by cars; I have the summary.

Q. We will bring that in later.

3430 A. In March, I have a movement from Texas to Missouri, Texarkana to Hoxie on the main line, the first and last terminals being Texarkana and Hoxie; the distance is 264 miles, and the schedule time is 27 hours on ordinary freight. We found 127 cars which consumed a total of 449 days, an average of 3½ days. I see this is carried out to fractions here; to make it consistent, with the other, I will drop those and make it three days.

Q. If you have the fractions read them into the record.

A. The movement from Louisiana points to St. Louis and beyond, McGehee being the first terminal in Arkansas, the cars travelling through Little Rock and up the Main Line to Hoxie, which was the last terminal, a distance of 221 miles—shall I repeat all these schedules?

Q. Yes, give it in full.

A. We had 104 cars which consumed a total of 486 days, an average of 4.6 days; the schedule time was 35 hours.

From Louisiana to Kansas City territory, McGehee is the first terminal and Van Buren is the last, 256 miles, and the schedule time is 26 hours; 38 cars, 137 days, an average of 3.66 days.

From Texas points to Kansas City, an adjacent territory, moving via Texarkana, and Van Buren, a distance of 298 miles, schedule time is 28 hours; 84 cars consumed 313 days, an average of 3.7 days per car.

3431 Southbound from St. Louis to Texas points, via Texarkana, the first terminal in Arkansas being Hoxie, distance 264 miles between those terminals, schedule time 24 hours. I found 391 cars consuming a total of 2170 days, or an average of

5½ days a car; that is a little over four days above the schedule time.

Moving from Kansas City via the White River Division, Main Line and Memphis Division to Memphis and beyond—that is Kansas City and territory—it is not all from Kansas City—distance 240 miles, schedule time 24 hours. I find 376 cars consuming 1009 days, averaging 2.7 days per car.

Kansas City territory to Louisiana and Texas, via Van Buren and Texarkana—some Louisiana stuff went that way—298 miles, between Van Buren and Texarkana, schedule time 22 hours, 355 cars consumed 1566 days in transit, average of 4.4 days per car.

Kansas City territory to Louisiana points, via Van Buren and McGehee, 255 miles, schedule time 22 hours, 85 cars consumed 296 days, or an average of 3½ days per car. Total schedule time for movement of those 1560 cars, on an average, was a little over one day per car, the actual time consumed averages a small fraction over four days per car.

Q. They found the spring months almost as inviting as the fall?

A. We found about the same condition: the averages are a little longer in October than in March, but the delay was there in

3432 March; that covers a total of roughly speaking, 3,000 cars.

Q. Have you the detail of that, giving the waybill, car number and everything, to show the data upon which these tabulations were made?

A. It is in our possesion, the detail back of these recapitulations.

Q. Have you that all ready so if these gentlemen want to investigate it, it is ready for their investigation?

A. I think it is in shape so it can be easily handled, yes, sir.

Mr. HILL: I will state, Mr. Moore, if you want to go into it, we will furnish you all the detail you may want to investigate it.

Q. There has been a good deal said in this record, about the division handling of cars; there seems to be quite a marked theoretical difference between the handling of trans-state, interstate and intrastate, have you investigated the question of handling of cars at terminals?

A. Yes, sir.

Q. Have you got any data worked out as against these theories, about the handling of them there?

A. We have made an investigation; I have the result of it here.

Q. State generally the methods that you have pursued, and what you have there, and then we will take it up somewhat in detail.

3433 A. I have a set of figures here, representing the condition of affairs that we found at all the through freight division terminals in Arkansas for five days in the month of October, 1907; the first five days—we stopped at the fifth day because it was an immense task; the cars were standing around the terminals so long it was a superhuman task to find some of them going out, and we didn't attempt to get more than the five days; I say all the terminals; I discovered this morning that the Little Rock figures had not been recapitulated although they had been compiled; that is being

done now, and I will have to omit that for the present, and I will get it for you a little later.

Q. What are the division terminals?

A. On the main line, Hoxie, Little Rock and Texarkana; speaking of the through freight divisions; there are locals mixed up between.

On the White River, Cotter and Newport; Newport is a junction of the Main Line and the White River; on the Helena Branch—that is the line from Knobel to Helena, Paragould and Wynne.

On the Memphis Branch, Memphis, Tenn.

On what was known as the Little Rock & Ft. Smith line—Central Division, Van Buren and Little Rock.

South of Little Rock on the Arkansas and Valley Divisions, McGehee.

On the Warren Branch, Warren, the terminus of the branch.

3434 Q. Did you mention Texarkana there?

A. Yes, sir, Hoxie, Little Rock and Texarkana—the main line—that was where I started.

Q. Give us the result of your investigation, take them up by division points?

A. We got at our figures in this way, taking Hoxie as an example; I can explain it by reference to a particular terminal better than I can by an abstract example.

We took all the trains shown on the dispatchers' sheets, as through trains, moving into Hoxie from the North; we listed each train, showing all the car numbers, the hour and date of their arrival at Hoxie, and as a little further guide, what the conductor said was the final destination of the car, in some cases the contents; having listed all the train as it came into the terminal, by car number and initial, we proceeded to trace those cars leaving the terminal, our plan being to find them going out in another train; that information being derived from the wheel report of the train that took them out of that terminal, and of course, when the cars were not in the care of the train crew going into the terminal or going out of the yard, they were charged up as being in the yard.

Q. May be they were out on the main line if they were transstate; did you find whether passenger traffic had been interrupted by storing them on the main line?

A. Of course, that wouldn't be good railroading to leave the main line blocked.

3435 Q. So you have assumed that they didn't leave that transstate freight on the main line?

A. No, sir, there is no question but what they were put away, stored somewhere.

Q. Then what did you do?

A. Deducting the hour and date of arrival in the terminal, from the hour and date of departure of the car, the lapse of time was the time the same was in the terminal, or the time in which the car remained in that terminal.

Q. From that dispatcher's sheet, you got the time it went into the terminal and the time it went out?

A. From the dispatchers' sheets we located all the through trains that went into the terminals, and then we took the conductors' wheel reports of those trains and the car numbers, and the hour and date of arrival of the train, and the hour and date of departure in other trains.

Q. From what the dispatchers' sheets or what the wheel reports showed?

A. From the wheel reports; we used the dispatchers' sheets as an index to what through trains came in that terminal, so we might know whether we got them all.

Q. Go ahead and explain what you have found?

A. Taking the Hoxie terminal—these figures cover all trains for the first five days of October, 1907, into Hoxie from the
3436 North, during that period, there were 23 through trains, hauling a total of 842 cars, 830 loads and 12 empties; the caboose is excluded from all these figures; it is a service car and is necessarily taken off at the division terminal.

Of those 842 cars, there remained in the Hoxie yard quite a long time—I will state the average first; I found that those 842 cars, the cars in that individual train went south from Hoxie in from two to seven other trains, and remained in the Hoxie yard from one hour and twenty minutes to two hundred and twenty-five hours and fifteen minutes.

Q. That is a nice place up there at Hoxie.

A. We found seven cars that stayed there 121 hours and 20 minutes; seven cars that stayed there 6 hours and 5 minutes; 2 cars, 52 hours; 2, 45 hours; four cars, 36 hours; 10, 34 hours; 35, 19 hours; 14, 22 hours.

Q. Was there any discrimination between the visitation at Hoxie, of trans-state, interstate and intrastate cars?

A. The only information we have on that is what the conductor said was the destination of the freight, and that is not very good, because we found they were not reliable on that; we didn't go to the waybills.

Q. You just took the wheel reports?

A. Yes, sir, he might have said it was going to Texarkana, and it would stop at Little Rock.

Q. You used whatever might be indicated on the wheel
3437 reports for whatever probative force it was worth; is it indiscriminate between the classes of traffic?

A. In the case of these trains coming from Hoxie from the north, through Missouri Division trains running all the way from Piedmont most of them, as we understand, are through trains; they may make some pick-ups and set outs, but with the exception of that, all of it was interstate; I wouldn't say all of it was, but the major portion of it was.

Q. It would be necessarily all interstate except what might be pickel up between the state line and Hoxie?

A. Yes, sir, some sixty miles of road.

Q. I believe you stated you haven't the Little Rock figures here?
A. Yes, sir.
That was stuff from the north into Hoxie which we traced out southbound; of the trains from the south into Hoxie, we found 13 trains, carrying 572 loads and 78 empties, total 650. Those cars went out in from three to seven other trains, remaining in the yard a period varying from 1 hour and 20 minutes to 103 hours and 40 minutes; we found 14 cars that stayed there 1 hour and 20 minutes, and 40 cars, 12 hours; 27 cars, 16½ hours; 34, 11 hours, and there are some cars that stayed there but two hours,—19 of them.

Q. Did you get the averages of that?

3438 A. They went out in from two to seven other trains; I have no average here in days; they can be figured from this data.

Q. Going out on the different trains was what I was asking you about; it was from two to seven?
A. Yes, sir; that is, the consist of any one train, went out in not less than two trains and some went out in seven trains; I mean the cars carried by the train.
Q. You mean that of the cars coming into Hoxie on those known trains, instead of going through on a bridge, they would go out on from two to seven trains?
A. Yes, sir, one train going into the terminal, the cars in that train going out in perhaps two trains, perhaps seven, that is the widest range, none less than two and none more than seven.
Q. You didn't find the unbroken train there?
A. Not at that terminal.
Q. I believe you did find that onion train somewhere else?
A. We found a train some place, I will get to it presently.
Q. Go ahead.
A. At Texarkana, we made no figures, because Texarkana is the end of the road; all trains are made up there or taken apart there, unless they should go over the T. & P. solid; I don't know as to those conditions; we had no means, without having access to the records at Texarkana, to check the deliveries from or to the T. & P.;

3439 a great many trains are taken apart there and put together there, that is the assumption.

Q. Proceed with the other divisions?
A. Beginning at the north end of the White River—Cotter terminal, trains coming from the north, we found 11 of them, hauling a total of 135 cars, 122 loads and 13 empties; one of those trains came through without a break, got through Cotter.
Q. Did it get through Newport without a break?
A. I can't say as to that; that was a train consisting of 9 carloads when it came into Cotter, stayed in Cotter yards from 9:40 P. M. until 8:35 P. M. the next day; that is the train, first 253 of October 4.
Q. How about the others in the Cotter yard?
A. I want to state that I got those figures backward; the cars remained in the yard there from 1:05 P. M. until 9:40 P. M. One train got through; the others went out of Cotter in from two to

three trains, some in two, some in three trains; the time which the cars remained in Cotter yard varied from one hour and 35 minutes to 147 hours and 50 minutes; 23 cars got through in an hour and 35 minutes; 5 got through in 1 hour and 40 minutes; next, 15 in 3 hours and 40 minutes; 10, 28 hours; 11 in 42 hours; 2 cars in 53 hours—there are others in between.

Moving through the Cotter yard in the reverse direction, coming up from the south, coming from the direction of Newport,
3440 we found 7 trains, 87 loads and 18 empties, total 105 cars; those went out to the north from Cotter in from three to six other trains, consuming in the Cotter yard time ranging from 1 hour and fifteen minutes to 181 hours and 50 minutes; six of them stayed there an hour and fifteen minutes; the next I find is 14 in 8 hours; 6 in ten hours; 16 in 18 hours; 12 in 21 hours; 9 cars in 58 hours and some few minutes.

Newport is a through freight terminal for the White River Division, although it is not a through freight terminal on the main line, as I understand it; coming down the White River Division from the north into Newport, during this period, I found six through trains, carrying 76 loads and an empty, 77 cars, which went out of Newport in from one to four other trains; here is a train that got through unbroken; it has twelve cars in it.

Q. It wasn't the same train you had up there at Cotter, because that had only 9 in it?

A. They may have added some up the line; they might have added some at Diaz or Batesville. The time consumed was from 3 hours and 20 minutes to 25 hours and 16 minutes; 13 cars, consumed the minimum time; 12 cars the maximum—in between, I find 3 in 12 hours, 20 in 17 hours; 15 in 3 hours and 40 minutes.

In the reverse direction, I find some trains that ran up the main line into Newport, set out their whole train there; they were exceptional, however, because Newport is not a through freight terminal of the main line, as I understand it.

3441 Those trains of which there were four, hauled a total of 66 loads and 20 empties, total of 86 cars; they went out in from one to eight other trains; here is one train consisting of 37 cars that was sent out in eight other trains; the train that came out solid, got through Newport, without being taken apart, consisted of 19 cars.

In that connection, I have here before me an abstract of the wheel report of train #254 into Newport, Oct. 3, 1907, ordinary freight, a train of 37 cars; it is my understanding, the conductor in listing his cars, puts it down in his train book and subsequently copies that and makes his wheel report; he will check his train beginning at either end of the train, at the engine or caboose, I don't remember which; when I used to come in contact with that, he used to begin at the head of the train, taking the numbers, and the yard clerk took the seals, and he came in and made up the wheel reports in that order and called for waybills; this copy of the report would indicate to me that this particular train was listed by the conductor

in that manner, or it had to be switched around a whole lot or virtually pulled to pieces.

Q. It was not governed by the "touch not, taste not, handle not," that some of them testified to?

A. I just mentioned that in passing; there were cases where two or three cars were switched together, but other cases where
3442 the individual cars were switched several times.

That disposes of the White River Division.

I have the stuff coming from the north into Van Buren, I found a total of 12 through trains, hauling 389 cars, 359 loads and 30 empties; they went forward in from two to nine other trains, and remained in the Van Buren yard from 2 hours and 35 minutes to 235 hours and 50 minutes.

Q. That is a nice country up there, I don't blame them for staying. Give us some of the instances there.

A. 15 cars, stayed 66 hours, in round numbers; 17 stayed 67 hours; 4, 80 hours; 12, 82 hours; 4 cars 174 hours; they range in between; here are 16 that stayed 2 hours and 40 minutes; 20 that stayed 14 and a half hours; 12 cars that stayed 39 hours.

Q. That was all necessarily interstate traffic, coming into Van Buren?

A. Yes, sir, I don't see how they could pick up any state business between the state line and Van Buren.

Q. There are no stops between Van Buren and the State line?

A. No, sir; that is between Van Buren and the state line, which came into Van Buren from the South.

Q. I thought you said from the north?

A. If I did, I was mistaken about it.

Q. That which would stop there would probably all be state business, and that which went out was necessarily all interstate?

A. Yes, sir.

3443 Q. Have you anything showing how much of that stuff stopped at Van Buren?

A. Yes, sir, 19 cars.

Q. Out of how many?

A. I don't know whether they were loads or empties.

Q. How many did you have, including the empties?

A. 389; 359 were loads.

Q. 19 of them were probably state business, if it didn't originate beyond the state coming into there, and the balance of them was necessarily interstate?

A. Yes, sir, if they left Van Buren, they were necessarily interstate.

In the other direction, coming into Van Buren from the north, I find 17 trains hauling a total of 372 cars, divided between loads and empties, 360 and 12 respectively. Those trains went out in from one to eight other trains; three trains got through unbroken.

The minimum time consumed in the Van Buren yard by those cars was 2 hours and 55 minutes, and the maximum 233 hours and 30 minutes.

Q. Those greased streaks of lightning took 2 hours——

A. They stayed in the yard 2 hours and 55 minutes, practically three hours; in between, I find 4 cars, 106 hours; 4, 136 hours; 26 cars, 33 hours; on the other hand, I find 18 cars that took 2 hours and 55 minutes; 13, 3 hours and 25 minutes; 18, 12 hours and a half; ten cars 22 hours, 12 cars 28, and so on.

3444 South of Little Rock on the Valley Division, I have the McGehee terminal, going into McGehee from the north, I find nine through trains, hauling 240 cars; 198 loads and 42 empties; those cars went out in from two to nine other trains out of McGehee; they remained in the yard a minimum of 6 hours and 55 minutes; a maximum of 127 hours and 15 minutes. I find in between, 6 cars, 98 hours; 2 cars 118 hours; 21 cars 58 hours; on the other hand, 4 cars got out in 12 hours; 19 cars got out in the minimum time,—6 hours and 55 minutes, virtually 7 hours.

In the other direction, coming up from the south, into McGehee, I found seven trains, pulling a total of 224 cars, 219 loads and 5 empties, forwarded from McGehee in from two to eight other trains. The minimum time which any car on these trains remained in the yard was three hours and a half, and the maximum, 552 hours and 20 minutes; that was only one car. We find 8 cars that remained 173 hours and 25 minutes; 51 cars, 22 hours; 23 cars, 28 hours; 19 cars, 42 hours; 4 cars, 114 hours.

Paragould on the Helena Branch, is a through freight terminal for trains coming down over the leased track of the Cotton Belt, the Illinois Division trains.

Q. They are all interstate going south and going north too?

A. Yes, sir, I understand the track being leased, I under-

3445 stand the Iron Mountain would not have the right to do local business on that track, and all of it is leased between the State line and Paragould.

Q. Necessarily all those figures are interstate?

A. Yes, sir. I found 7 trains—I would like to qualify that in this respect; in case some stuff came from the south in a through train, it might have been that the stuff was going on north of Paragould on the Helena Branch, to Knobel or Corning, which might have been State business, but so far as stuff coming from the north into Paragould is concerned, your assumption that it is all interstate, is correct.

Q. Something originating in south Arkansas, coming up there, might be diverted over to the Main line or Branch line west of Paragould?

A. Suppose we had a car at Wynne, destined to Knobel, a state shipment, and a train for Paragould made up largely of Illinois Division freight, perhaps the engine was short of her rating, the tonnage was light, they might very properly put the Knobel or Corning car on that train, take it off at Paragould and put it on the local, and that would be state freight, but the reverse movement coming from Missouri into Paragould terminal, must necessarily be all interstate.

Q. Do you know whether that movement that would be diverted there could be of any considerable extent?

A. There is not a great deal of track left to serve between
3446 Paragould and the Missouri-Arkansas State line, via Knobel, and I should not imagine there could be a great deal of it.

Q. About how much track is there of that?

A. About 81 miles.

Q. Necessarily all which is northbound freight would be interstate, except that possibly there might be some cars serving that territory of 81 miles?

Mr. MOORE: I object to that, that is a very unfair assumption, to my mind—necessarily all of it going north would be interstate freight.

Mr. HILL: I say except that which might be diverted on this 81 miles of track?

WITNESS: Perhaps, I did not make that clear, Judge; I will: what I meant to say was this, that a train going into Paragould from the south, moving up the Helena Division, unless the freight was destined to Paragould proper, or to some other station on the 81 miles of track between Paragould and the Missouri-Arkansas State line, it would necessarily be interstate freight; for this reason, it would only be hauled to Paragould for delivery there to the Illinois Division or for delivery to some station on this 81 miles of track in Arkansas, or for delivery to the Illinois Division, which operates north out of
3447 Paragould and over the leased track, and as on that leased track, the Iron Mountain has no right to do local business, and it has none, it would have to haul trains across the Missouri-Arkansas State line intact,——

Mr. MOORE:

Q. How many stations are there north of Paragould on that branch?

A. I said that also included the main line between Knobel and the State Line; I am assuming also that they would not haul any stuff up to Knobel and backhaul it; there might be a little of that.

I find between Paragould and Knobel, two stations at which agents are maintained, and 4 stations at which no agents are maintained.

Mr. MOORE:

Q. Isn't Jonesboro one of those stations?

A. It is not on the Iron Mountain; it is on the Frisco and Cotton Belt.

Q. Isn't that right off the Iron Mountain's line?

A. It is south of Paragould on the Cotton Belt; I meant to cover all that by saying the car destined to Paragould,—as far as the Iron Mountain is concerned, a car destined to Jonesboro would be taken to Paragould, and there delivered to the Cotton Belt.

Q. If there was a shipment on the Iron Mountain to Hoxie,
3448 it might be delivered there.

A. That is back haul stuff, I should say, down to such a point as the mileage would equalize the distance by Bald Knob and Wynne.

Q. Those are important stations——

A. Yes, sir, but there are no important stations on that line between Wynne and Paragould to ship anything from.

Mr. HILL:

Q. If it originated in Memphis, where most of that stuff originates, how would it go?

A. It ought to go to Bald Knob and up the main line, because they would have to back haul it the other way, if they did not send it that way.

Mr. MOORE:

Q. What stations are north of Knobel in Arkansas?

A. I haven't included Knobel, it was the junction; I will take that in now as a main line station; do you want them by name?

Q. It is immaterial.

A. The only station of any size is Corning, then Moark; those are the stations at which agents were maintained.

Q. Is Moark in Arkansas or Missouri?

A. It is a mile and a half south of the line; including Knobel, there are three stations shown with station agents, and seven stations without agents.

Mr. HILL:

Q. A through train is not supposed to stop where there is
3449 not an agent?

A. I don't know, sir. Those trains into Paragould would carry cars going to those stations at times.

Referring to Mr. Moore's question, whether there might be some stuff originating south of Paragould, and destined to Knobel, that would have to be back-hauled, I should say it would be a very rare occasion where that stuff would be hauled in through trains, and it is through trains I am discussing; it would be locals that would pick up that stuff, in the orderly conduct of the road's business.

Any business from north of Wynne and south of Paragould, which it would be expedient to haul around by Knobel and down the main line south, would be in a local and not a through train, and if it moved from Wynne, the sensible route and usual route would be over to Bald Knob and by the main line; we are only considering through stuff, and if it was destined south of Knobel on the main line, it would not originate on a through train north of Wynne; the local would pick it up and carry it on to Knobel.

Q. I believe you have demonstrated that there was a possibility of some of these negligible quantities being shipped that way?

A. The backhaul stuff if it originated south of Paragould, would not go in a through train; it ought to go in a local, and a local sets out all its cars at Paragould.

From the north into Paragould, that is the other side of the
3450 proposition, coming over the leased track where we have said the business would necessarily be all interstate, I find five trains, 112 loads and 24 empties, total 136 cars, which went out in

from one to seven other trains. Two trains came through unbroken; the minimum time consumed in the Paragould yard was 1 hour and 49 minutes; the maximum, 250 hours and 25 minutes.

Mr. MOORE:

Q. Can you distinguish between loads and empties as to which ones went out?

A. Yes, sir;—that is the detail will give that; I haven't tabulated that; I have just considered a car as a car, whether loaded or empty.

Mr. HILL:

Q. Have you that so you can state that in that connection?

A. No, sir, I would have to make the figures, it can be done if you desire it.

In between those two extremes, I find 22 cars remaining in the yard 12 hours; eight cars, 13 hours; 3 cars, 31 hours; however, there were 21 cars that remained but two hours and a half.

From the south into Paragould, I find seven through trains, hauling 93 cars, 81 loads and 12 empties, which went forward in from two to five other trains. The minimum time which any of these cars remained in the Paragould yard was 8 hours, eight cars staying there that length of time. The maximum is 481 hours;
3451 that was apparently a bad order car, or was held for some extraordinary reason. I find two cars, 59 hours; 21, 26 hours; 12 cars, 27 hours; others in between, ranging from 10 hours to 25 hours.

Mr. MOORE:

Q. Did you say 7 trains with 93 cars?

A. Yes, sir.

Q. Isn't that a little unusual?

A. Yes, sir, they were light, but I have the car numbers and initials; that is all we found.

The Wynne proposition is rather negligible; I have some figures here; most of that stuff runs through Wynne, although I found two through trains, 41 cars, all loads, minimum one hour, maximum 104 hours and 50 minutes; one went out in two other trains and the other went out in four trains.

Q. That is practically all interstate?

A. It might be anything at Wynne, it might be state or interstate, or anything else; that was moving from the north into Wynne.

On the Helena Branch points from the south into Wynne, I found three trains, 54 cars, all loads, minimum time, 1 hour and 20 minutes, maximum 66 hours and 15 minutes. In between, I found cars ranging from nine to 34 hours up to 66; those trains, of which there were three, one went out in four trains; another in three trains, and another in four trains. That cleans up that

proposition, with the exception of the Little Rock figures,
3452 and as I recall, we didn't find any trains that came through Little Rock without stopping; that will be ready after lunch, if you want it.

Q. That finishes all of those?

A. Yes, sir.

Q. While we are on this trans-state proposition, there is some talk about the various facilities that were used for trans-state business—it was said that the trans-state freight did not use the facilities, and there was some testimony that the cattle traffic is practically all interstate? Have you any data there showing what facilities there are for the cattle traffic, interstate traffic, whatever it may be?

A. I think I have, yes, sir. The Company's official list of station and agents—I had the list of the Company effective in 1907 when I made these figures; I haven't it here now, shows the stationary live stock facilities in the state, shows where they are located, the number of pens, and their capacity in cars, and details, as to whether the water is accessible. Do you want the details?

Q. No.

A. I found that stock pens are located at 65 stations, and equipped with stock handling facilities; that 187 pens, having a total capacity of 504 cars are maintained, as stated in the Company's official list.

Q. The cotton platforms, I believe that is already in evidence, that all stations are equipped with them?

3453 A. I don't know as to that.

Q. Have you in your possession, the data from which you have deduced these figures you have read into the record, the car numbers and details of it?

A. Yes, sir, it is one step from our sheets which I have here to the Company's wheel reports.

Q. You have those ready for inspection of these gentlemen, if they want to inspect them?

A. Yes, sir, with the exception of Little Rock.

Q. We will take that up after lunch.

Mr. McPherson said that strictly speaking, no part of the yard organization cost, nor of the switching service, is chargeable to trans-state traffic.

Mr. MOORE:

Q. What page is that?

Mr. HILL:

Page 343 of Volume 1 of the printed record.

Q. "Strictly speaking, no part of the yard organization cost, nor of the cost of switching service is chargeable to trans-state traffic." Do you know from your experience in terminal work, where these trains would be and what service would be performed to these trains that you have shown laying in yards for days?

A. I have no first hand knowledge of conditions in Arkansas, and was never employed around an Arkansas terminal, but from

my experience in other terminals, I should say that they were moved around a good deal, kicked around a good deal, as
3454 the switchman call it; a car staying in the yard 50 or 60 hours would undoubtedly get moved around a good deal.

I base that on this, it was at one time, at intervals, a part of my duty, to take a check of the yard when I was employed by the L. & N. in East St. Louis; we used to go out and take a check of the yard over the Yardmasters' head, every once in awhile, and I have done that sometimes on four or five successive days; I acted in that capacity when the work was light on the bill desk, helping the chief clerk; I used to have it very forceably impressed on me, that I never found the same cars on the same track, indicating that the cars were moved around a good deal; I don't know whether the local conditions in Arkansas are the same; I do know that cars left in the terminals will get shifted a good deal.

3455 Q. Have you now before you the results of the investigation of the Little Rock terminals?

A. Yes, sir, that is, of the handling of through trains in those terminals.

Q. I wish you would give them in the same way you did the other terminals.

A. This is for the yard at Argenta, Arkansas——

The MASTER:

Q. Trans-state?

A. No, sir; through trains.

It covers the first five days in October, 1907, the same that was covered by the data given for the other terminals.

I find 18 trains running into Argenta from the north, hauling 822 cars, 797 of which were loads and 25 were empty. These cars went out of the Argenta yard in various directions in from three to eleven other trains and none of them got through unbroken.

I find that the time spent in the yard varied from 3 hours and 40 minutes to 189 hours even.

I find at the minimum figure, 42 cars.

I find 26 cars remained 7 hours and 40 minutes.

40 cars remained 11 hours and ten minutes.

3 cars remained 16 hours.

17 cars remained 19 hours.

3456 18 cars remained 29 hours.

17 cars remained 42 hours.

Ten cars remained 60 hours.

That is along the lines of the information given as to the other terminals—that is, from the north.

Now, from the south into Argenta:

I find in the same period 15 trains hauling a total of 444 cars, of which 367 were loads and 77 were empties.

Those cars were forwarded out of Argenta yard in their various directions in from two to seven other trains,——

Mr. HILL:

Q. You did not find the onion train?

A. It did not show up in those five days——

The time consumed in the Argenta yard varied from 2 hours and 30 minutes to 104 hours 55 minutes. Only one car consumed the minimum time.

I find 25 cars stayed in the yard 10 hours; 20 cars stayed 11 hours. 16 cars stayed 15 hours; 25 cars stayed 50 hours; and so on up. Some few cars stayed a shorter time; for instance, two cars four hours; three cars stayed five hours and one car stayed six hours.

The bulk of the cars were in the yard 15 hours and over, some of them as long as 104 hours.

3457 Q. I want to call your attention to the testimony of Mr. Frank May, on page- 332-3, volume 2 of the printed record:

"Necessarily the revenue basis is dependent upon how nearly the rate is based upon the cost of service, isn't it?

"A. Yes, sir.

"Q. If the rate does not reflect the cost of service, then this, as a basis for ascertaining the respective expenses intrastate and interstate, would not be of value?

"A. If that was true, if the rate did not reflect at all the cost of service, of course it would be of no value.

"Q. Its value is entirely dependent upon how nearly the rate reflects the cost of service?

"A. Yes, sir."

Now, have you made an investigation of the rates prevailing in Arkansas upon the leading commodities, to ascertain how nearly that rate reflects the cost of service?

A. Yes, sir, we have made an investigation of actual movements under the rates prevailing in Arkansas, during the period which is the subject of our inquiry here, but we have arrived at our conclusions as to their relation to the cost of service, rather on a comparative basis, than by any attempt to segregate the rate into cost and profit.

3458 Q. Let's take up in detail the result of your investigation; what is the first one we have?

A. I see here on the top of my pile, Exhibit #40, which was the rate map prepared by us and approved by Mr. Perkins, and filed by him, showing the zone rates on pine and cypress lumber, and articles taking the same rates from certain producing territory in Arkansas and Louisiana to St. Louis, Cario and Thebes.

Q. Take that lumber map and explain it and the practical operation of the same?

A. The map was intended to show the size of the zone from which rates apply on a flat or blanket basis, and we undertook to ascertain what the actual movement was from the various points in that zone to the receiving territory at St. Louis and Cairo, indicated on the map.

Just a word of explanation before we go into the results of our examination.

To explain the map a little further, the producing zone shown on the map, circled by a heavy black line, marked "A" includes stations shown in the St. Louis, Iron Mountain & Southern Tariff #4903-A, Inter State Commerce #5057, from which a blanket rate of 18 cents applies on pine and cypress lumber, carloads, to St. Louis, and the blanket rate of 16 cents to Cairo and Thebes is applied.

Q. Just a word of explanation of the blanket rate; you mean by that a rate which is simply a flat price from that zone to the point of destination?

3459 A. Yes, sir, I will say that this 18 cent rate to St. Louis applies from each of the 584 stations in that zone, some in Arkansas and some in Louisiana.

Q. Some in Texas too, aren't there?

A. Not shown on this map, no, sir. That is another tariff, and the map confines itself to one tariff, and the similar rate from the same stations, 584 in number, but 2 cents per one hundred pounds lower, applies to Cairo and Thebes.

The most northerly point in the zone that is nearest to Cairo and St. Louis is Little Rock; the southern extreme of the zone is at Lake Charles, Louisiana.

Q. How far apart are those?

A. The business would not be moved from Lake Charles through Little Rock, and the comparison would fall to the ground there, it would follow the route through McGehee, Wynne and Knobel.

Little Rock is 345 miles from St. Louis. Alexandria, the junction of the line which takes freight from Lake Charles to the Iron Mountain rails, is 599 miles to St. Louis, short line mileage.

That explains in a general way what the map is for, and explaining further the blanket rate feature, I would say that of the 584 stations I have described as being in this zone, and from which that rate applies to St. Louis, 319 are located on 36 other lines, which connect with the Iron Mountain, and which necessarily would receive for their haul, a varying proportion of the blanket rate,

3460 shrinking the Iron Mountain earnings by the amount of the allowance for their haul.

As an illustration, the rate from Lake Charles to St. Louis is 18 cents, according to the tariff, and so shown on the map; out of that, the divisions of the rate current during the period of our inquiry, would allow the St. Louis, Watkins & Gulf Road, for its haul from Lake Charles to Alexandria, six cents, leaving for the Iron Mountain haul from Alexandria to St. Louis 12 cents. If a car of lumber originated locally at Alexandria, even though it were hauled in the same train as the car from Lake Charles, it would earn for the Iron Mountain 18 cents per hundred pounds for exactly the same haul. In other words, the Iron Mountain will get just two-thirds of the earnings on a car of similar weight originating at Lake Charles, that it will on one originating at Alexandria.

Q. The cost of service is less when they received it from another line than when they haul it on their own line?

A. Yes, sir. There seems to be a question as to whether a car originating at Alexandria would not entail a heavy terminal ex-

pense, on account of the car being placed on some industry track or placed for loading, and taken away when loaded; that is the most unfavorable condition that could prevail, the most expensive condition that could exist, first the placing of the empty, then the removal of the loaded car, and hauling to the train track after
3461 it was loaded; it has been assumed,—I think Mr. Perkins made the statement, that there would be a greater terminal expense in connection with the last car than the one coming from the connecting line, the Watkins and Gulf, for instance.

Without questioning the accuracy of that statement, I would like to call attention to the fact, that moving out of Alexandria in the month of October, 1907—and our investigation covers the period ranging from the 1st to the 15th of the month—we took half the month just to get a line on it, moving out of Alexandria during that period, I found 22 cars going from the Louisiana Railway & Navigation Co. to the Iron Mountain, the Iron Mountain's proportion of the rate being 12 cents a hundred. I found 22 cars coming from the Louisiana Ry. & Navigation Co., of which the Iron Mountain got 13 cents I should have said, and 16 cars coming from the Watkins & Gulf at Alexandria, on which they got 12 cents, both connecting lines at least; it appears to me on the fact of it, that a similar service would be rendered for 22 cars on which they got 13 cents, and for the 16 cars on which they got 12 cents, but there is one cent a hundred pounds difference in the cost; one of those rates is not based on the cost of service.

Alongside of that movement, I have 18 cents flat, nine cars, showing that the assumption I started my statement with, is borne out by actual movement.

3462 Just along that line, I have the whole movement that we found under this tariff for the 15 days I spoke of. All of this business is handled to St. Louis. We start at Little Rock, the most northerly point in the zone, and I find 11 cars on which the Iron Mountain got 18 cents, a hundred, a haul of 345 miles; down the Main Line of the Iron Mountain 24 miles at Benton, we find a movement of 18 cars, on which they got but 14 cents, although the Iron Mountain's haul on its Main Line over the same track, the Benton cars passing directly through Little Rock on their way to St. Louis, was 24 miles further in the case of the Benton shipment, and the rates 4 cents less for the shipment. If the Little Rock rate is an index to the cost of service, the Benton rate is not, and vice versa. The reason the Iron Mountain got but 14 cents was that it allowed the Little Rock & Hot Springs Western Railroad four cents per hundred pounds for its haul, for freight originating on its line.

I find 14 cent rates, comparing them with that Benton rate, applying from Pine Bluff, 36 cars moving 387 miles to St. Louis, and necessarily moving through Little Rock on their way to St. Louis. The other four cents of the blanket rate, in that case, went to the Pine Bluff & Western.

I find again 4 cars moving from Malvern, originating there at flat 18 cents, 389 mile haul to St. Louis; I find cars originat-
3463 ing on the Iron Mountain rails at Saginaw, below Malvern seven miles, moving at 14 cents; the other four cents went to the Saginaw & Ouachita Valley Railroad.

I find a movement of three cars from Donaldson, still on the main line 400 miles from St. Louis, at 18 cents, originating locally at Donaldson, and the Iron Mountain getting all the rate; ten miles below, I find a movement from Daleville, coming from the U. T. A. & M. Ry. for which the Iron Mountain accepted 12 cents.

As a parallel for the illustration I gave at Alexandria, I find movements from Montrose, on the Valley Division of the Iron Mountain, business coming from the Crossett Railway, five cars, 14 cents, eight cars from Montrose proper, at 18 cents.

7 cars coming from the Mississippi, Hamburg & Western at 14 cents. Wherever the rate I am quoting is less than 18 cents, the difference between the rate quoted and the 18 cents, went to the connecting line originating the business, or at least delivering it to the Iron Mountain.

Q. Whether it was a railroad or tap line?

A. They are all connecting lines to me; I don't know whether they are common carriers or not, but they are getting divisions of the rates.

3464 At Prescott on the Main Line, 442 miles from St. Louis, I find 9 cars coming from Prescott & Northwestern, of which the Iron Mountain got 13 cents, having allowed 5 cents to the connecting line; there is a movement 97 miles further than Little Rock, directly through Little Rock, at 5 cents less rate than a car can be shipped from Little Rock; if the 13 cent rate indicates the cost of service from Prescott, surely the 18 cent rate cannot indicate it from Little Rock 97 miles closer to St. Louis.

I find at Warren, Arkansas, the end of the Warren Branch of the Iron Mountain, the haul to St. Louis from Warren being 455 miles, two cars originating locally, on which the Iron Mountain got 18 cents a hundred; 41 cars coming from the Warren & Ouachita Valley Railroad, on which it got 15 cents, there being an exactly similar haul for the Iron Mountain after it got the cars; and one car from the Wilmar, Johnson & Saline Railway, via same junction, same haul, on which they accepted 13 cents. There are three rates covering a total of 43 cars, two of which moved at 18 cents, 41 at 15, and one at 13. Some two of those rates are not based on the cost of service; one may be.

Q. The cost of service seems to have been a little mixed up when it got to Warren?

A. Yes, sir; the strongest contrast there is between the two rates applying on cars coming from two connecting lines, where the service would be similar; there might be that difference in service

3465 on stuff originating locally that I spoke of in the first instance.

Q. Have you ascertained the different divisions that the Iron Mountain makes with its connecting lines, or tap lines, as the case may be?

A. Yes, sir, the difference is between the 18c rate and the rates I have been quoting.

Q. Have you a separate tabulation of the division sheets?

A. Yes, sir, I have a memorandum that will afford that infor-

mation. I don't know that it covers the division sheets, because we simply got enough information to cover the cars we had on our sheets.

To draw a comparison between the extremes on this statement, I find that 18 cent rate applying from Little Rock 345 miles from St. Louis, and 12 cents from Alexandria, 599 miles: Those two movements would be over different portions of the Iron Mountain road; that is, the Alexandria shipment need not come through Little Rock, very probably wouldn't, but comparing the extremes on one line of road, I find 18 cents from Little Rock and 11 cents from Hope, which is 458 miles from St. Louis.

Q. Passing over the same tracks?

A. Yes, sir, necessarily passing through Little Rock on its way to St. Louis.

Again on this division, I haven't the division sheets here, they are not open to public inspection, we were given the information I desired.

Q. You made a memorandum from these?

3466 A. Yes, sir; speaking now of St. Louis business under the 18 cent blanket rate, the Little Rock & Hot Springs Western got 4 cents.

Q. That is four cents of that 18 cents?

A. Yes, sir, that is the proportion they got for their haul up to the Iron Mountain rails?

The Gifford & Southeastern, 3 cents.

Pine Bluff & Western, 4 cents.

Perla & Northern, 3 cents.

Malvern & Freco Valley, 3 cents.

Saginaw & Ouachita River Railway, 4 cents.

Elmore & Southwestern, 2 cents.

U. T. A. & M., 6 cents.

Arkansas Southwestern 6 cents.

Clark & Pike County 3.

Q. How much of a railroad is that Clarke & Pike County?

A. I made some inquiry, and my information is that during the latter half of 1907, it was something less than half a mile in length; previous to that time, the Interstate Commerce Commission report shows it to be 12 miles, but the steel had been torn up. Three cents for a one mile haul would be 60 cents a ton a mile.

Q. How much would it be a ton a mile if they still had twelve miles of rail?

A. It would be 1/12, 5 cents.

Q. That is a pretty juicy division sheet itself.

A. I don't know the conditions which dictated the di-

3467 vision.

Crossett Railway got 4 cents.

Miss. Riv., Hamburg & Western, 4.

Prescott & N. W. 5.

Q. How long a road is that?

A. In the year ending June 30, 1907, which is the last issue of

the Interstate Commerce Commission report that has been gotten out, the Prescott & Northwestern Railroad was 41 miles long.

Q. What was its division?

A. On St. Louis business, they got 5 cents.

Q. How much did that Clark & Pike County get?

A. 3 cents; of course that 5 cent division allowed the Prescott & Northwestern applied from all stations on its line.

Q. Whether they picked it up a mile out of Prescott, or whether they went 41 miles?

A. Yes, sir, to the terminus of the road.

Q. Go ahead:

Lester & Ouachita Valley allowed 4 cents.

Arkansas & Gulf, 3 cents.

Warren, & Ouachita Valley, 3 cents.

Wilmar, Johnson & Saline, 5 cents.

Arkansas & Louisiana, 3½.

Q. How long a road is that?

A. It runs from Hope to Nashville, in that direction, I cannot find that in this report.

Louisiana & Arkansas, 6 cents, which connects at the same junction as the Arkansas & Louisiana road.

3468 Q. Is that the one that runs way down to Minturn, La.?

A. Yes, sir.

Dorcheat Valley Railroad Co., got 6 cents.

Louisiana Ry. & N. Co., connecting with the Iron Mountain at Selma, La., got 3 cents.

Boston & Little River Ry. Co., connecting with the Iron Mountain at the same junction, got two cents.

Schwartz & Ouachita City, got 4 cents.

Monroe & Southeastern Ry. Co. got 4.

Louisiana & Pine Bluff 5.

Ouachita got four.

Natchez, Urania & Ruston got 3 cents.

Texas & Gulf via Rochelle, two cents.

Enterprise Ry., a Louisiana Railroad, 4 cents.

Natchez, Ball & Shreveport, got four cents.

Louisiana Railway & Navigation Co. got 5 cents, and the St. Louis, Watkins & Gulf, 6.

Those cover the divisions allowed these roads, whose billing we found moving during that period; we found movement covering all those, aggregating 566 cars.

The divisions which we have used here were furnished us by the Assistant Auditor of Freight Receipts of the Missouri-Pacific, whose duty it is to make a settlement with their connecting lines on this through business. They were given us, taken from the division sheets in our presence, as being the divisions current at the time these shipments moved.

3469 Q. Summing that up, it runs from one cent up to seven?

A. Yes, sir.

Q. You have some other lumber maps there?

A. Yes, sir.

On the Cairo movement, also shown on this map, we find practically a similar condition, the divisions being the same, and the length of the haul varying relatively, not in the same figures, because Cairo is further south from St. Louis; we find a movement of 215 cars from the same territory, ranging from the 16 cent rate from Little Rock to 11 cents from Alexandria, Little Rock being 254 miles from Cairo and Alexandria 507.

Q. It seems to me the cost of service out of Little Rock is pretty heavy on lumber?

A. I am just stating the fact; I find a nine cent rate to Cairo from Hope 296 miles from Cairo.

Q. Who is it that got the nine cents?

A. The Iron Mountain, and the Dorcheat Valley got seven.

Q. They have the same division to Cairo that they have to St. Louis?

A. Yes, sir, the division sheets give the same division to these two points.

That takes up the map known as Exhibit 40, filed by Mr. Perkins.

Q. There is another lumber map there, isn't there?

A. Yes, sir.

3470 The other map is Exhibit 39; it is gotten up along the same lines as Exhibit 40, tending to show in more or less graphic form, during the time the exhibits cover the rate applied from and to certain places.

There are three receiving or consuming zones shown on this map, one of which extends to Coffeyville, Kansas on the south, to and including Omaha, Neb., on the north; it extends as far east on the main line of the Missouri Pacific as Etlah, Mo., about 80 miles west of St. Louis, taking in Kansas City, Atchison and St. Joe and stations between those points and Omaha, and between those points and Coffeyville.

The rate to that zone from the producing zone, marked "B" is 23 cents, from all points in the zone to all points in the other.

The other zone marked "C", embraces some territory in middle Kansas, the rate being 28½ cents to all stations in that zone, from all stations in zone "B".

The third zone, marked "D" begins just west of Hoisington, Kansas, on the Missouri Pacific line, crosses Kansas and Colorado and extends to the western terminus of that line at Pueblo, and takes in the Denver & Rio Grande from Denver to the south end of the road below Trinidad, in Colorado. The rate to Zone "D" from all stations in Zone "B" is 34 cents.

These rates were taken from Missouri-Pacific, Iron Mountain joint freight tariff 5116, Interstate Commerce No. 6228, effective during the last six months of 1907.

3471 Q. Explain the practical operation of that?

A. Zone B, the producing territory, covers 236 stations on the St. Louis, Iron Mountain Southern, and 300 stations on other connecting lines, just as we have been discussing in the case of the St. Louis rates.

Zone A the consuming territory, includes 390 stations on the Missouri-Pacific Railway in Missouri, Kansas and Nebraska, to which the 23 cent rate applies, from the 536 stations in Zone B.

Zone C, the consuming territory, covers 42 stations on the Missouri Pacific Ry. in Kansas, to each of which a 28½ cent rate applies from each of the 536 stations in Zone B.

Zone D, consuming territory, covers 52 Missouri-Pacific Stations in Kansas and Colorado, and 80 Denver & Rio Grande Railroad stations in Colorado, and to each of these 132 stations in Kansas and Colorado, a 34 cent rate applies from each of the 536 stations in Zone B, in Louisana and Arkansas.

We found some movement under those rates; I haven't the waybill numbers here; this is a summary we have; the numbers of the waybills, the dates, the stations making the waybills, and the car number for each of these movements.

Q. What is the extent of that movement?

A. From producing territory Zone B, to Zone A, we found a movement in the first fifteen days of October, 1907, under the rates shown in Exhibit, of 426 cars.

3472 The movement from Zone B to Zone C was 57 cars, and to Zone D, 61 cars.

Q. It was not a paper tariff?

A. No, sir, and the divisions of those rates vary with the allowance made the originating lines in Arkansas and Louisiana, as they did in the case of the lumber zone.

Q. What division is also made with the Denver & Rio Grande at the other end of the line?

A. There is a division made, but that information is not available at this time; I didn't attempt to show the Missouri-Pacific figures, except what was allowed the originating line, and treated the Missouri-Pacific and D. & R. G. as one proposition; we made some other figures in that connection, showing the allowance at both ends.

Q. The cost of service seems to be very nicely reflected there—we will go on to the next item you have.

A. Where the hauls are similar, and the rate differs, one rate does not reflect the cost of service; of course, which one, I am not prepared to say.

We have a map, exhibit #42, which covers Texas common points, approximately 2600 stations in Texas, to which a blanket rate applies from large territorial zones.

The map does not show all the zones in what are known as defined territories, because it would have been so confusing you

3473 could not have told where one zone began and one left off; we elected to show the Pittsburg territory, Chicago-Cincinnati territory, and St. Louis territory, and those are shown on the map respectively as Zones A., B., and C. The receiving territory is shown as Zone D, which includes the common points in Texas.

Q. That is all movement towards Texas?

A. Yes, sir, this is southbound movement.

The St. Louis rate territory extends from Southern Mississippi and a portion of Southwestern Alabama to Central Illinois, extending

west almost to the Missouri-Kansas line, taking in the major portion of Missouri, and some sections of northern Arkansas; the result being that the same rate applies from St. Louis to any of the 2600 common points in Texas, as from Newport, Arkansas, for example, or the same rate applies from Jefferson City as from Whitehall, Illinois. In the case of the Jefferson City shipment, the shipment is Missouri-Pacific, that company performing the haul to St. Louis, and in the case of the Illinois shipment, the division would have to be allowed the connecting line east of the Mississippi River, and some provision has to be made for the absorption of the bridge transfer at St. Louis either by the Missouri-Pacific or the connecting line; that would probably be taken care of, in arriving at the eastern line's division.

Zone B, Chicago and Cincinnati territory, takes in Frank-
3474 fort, Kentucky on the southeast, and extends out to Omaha;
its connects with the St. Louis Zone near St. Louis, the boundaries of the two zones being the same line, but the rates from Zone B territory are made by adding a fixed differential on each class, to rates from St. Louis, and those rates do not, as Mr. Watson has testified, divide as they are made; in other words, business from Chicago, where a certain differential is added to make the through rate, added to the St. Louis rate to make the through rate to Texas—say the Chicago and Alton Road bills a shipment from Chicago to St. Louis or East St. Louis, for delivery to the Iron Mountain the C. & A. would give a fixed part of the rate, more than was added to the St. Louis rate to make the Chicago rate, resulting in a shrinkage of the Iron Mountain earnings south of St. Louis on a shipment for Texas, as compared with the rate which they would get from St. Louis on an exactly similar shipment from St. Louis, and where they would do the same service from St. Louis to Texas, on each of the two shipments.

In my particular case, my experience with the terminals at St. Louis and East St. Louis, and from my practical experience in handling business through these terminals, would lead me to say that the terminal expense on shipments crossing the river, say one
originating in Chicago, would be greater than on the one orig-
3475 inating locally, and for this reason, if the western line absorbed the transfer charge, while that would not be charged to operating expenses but deducted from its freight earnings, in fact, it is done automatically in making the waybill, nevertheless, it would be the cost of getting the goods to its railroad in St. Louis or to its warehouse, in the case of L. C. L. freight; a shipment originating locally in St. Louis would be dumped at the warehouse door very close to the car in which it was to be loaded, if the freight house was properly operated.

There would be less revenue to the Iron Mountain, and they would have to divide the through rate. If one rate reflects the cost of service from St. Louis to Texas common points, the other would not; that is, assuming they were both going to the same point in Texas and not considering the blanket rate feature down there.

The same is true of rates from Pittsburg territory, only the differential is higher.

Q. Take the illustration of the shipment from Chicago, on the Chicago & Alton, and supposing that shipment would go to the farthest point in Texas in the common point group, and the shipment originating in St. Louis would go to the nearest point within the Texas group, what would be the difference in the haul down there?

A. As far as the lines south of St. Louis are concerned,
3476 and that is where the Iron Mountain's interest in the shipment begins, there is a possible variation in the haul of 400 miles, between the nearest and most distant Texas common points; that is in round figures.

Q. How is that division made in the exhibits in this case, of that revenue that has been received on these shipments passing through the state to Texas common points?

A. You mean the division as to the earnings on the Iron Mountain Railroad, on a track mile basis?

Q. Yes, sir, explain what effect that would have?

A. To allot to every mile of the Iron Mountain, the same revenue on that shipment, the same proportion of that rate.

There is another feature in connection with the blanket end of the rate in Texas, and that is the Texas lines get varying divisions, which naturally vary with the length of the haul, so while the Iron Mountain would be performing the same service from St. Louis to Texarkana, its revenue would diminish as the divisions allowed the Texas lines increased.

For instance, I don't know the exact figures, I haven't the T. & P. divisions here, but this seems quite a possible case to me, that a carload of merchandise was loaded at St. Louis for distribution on the Texas & Pacific, that could go through unbroken, assuming such a car moved, and it undoubtedly would get the same service,—each
piece of freight in that car would get the same service on
3477 the Iron Mountain rails, but the Iron Mountain revenue on each piece of freight would be determined by the divisions allowed the Texas lines, owing to the length of the haul in Texas.

Q. And beginning at the first instance, with the division allowed before they get into St. Louis if the shipment originated beyond——

A. That is a variation at the other end; this illustration is for shipments in the St. Louis car.

Q. I believe these gentlemen have testified something about the ton mile reducing every thing to a common level; there seems to be some common level reduction in the other basis that could reduce the revenue from all these shipments originating east of St. Louis and going to varying points in Texas, where exactly the same service is performed from St. Louis to Texarkana, to a common level, when they go to take the revenue to put it into these exhibits, as indicating the interstate revenue?

Mr. MOORE: I want to object to that on the ground that it is a matter of inference, does not involve the facts, and is argumentative.

A. Without having any actual data as to the movement, and we did not consider it necessary because I think it would be admitted by anybody who knows the Iron Mountain road, that it has
3478 a large volume of Texas business, without having any figures; as a matter of common logic, I should say that the service was reduced to a common level, but the operating expenses charged against it on the revenue basis of division, fluctuate as these divisions of rate fluctuate.

Q. Had you finished that Texas common point proposition in that explanation?

A. Yes, sir.

Q. Take up the next map.

A. I have Exhibit 41, covering zone rates on cotton seed products, from Arkansas and Louisiana producing territory to points in Missouri and Kansas; we found that that tariff was actually in operation, and that there was a blanket rate of 17 cents from various points in the cotton belt—cotton oil mill belt, to a lot of stations in Missouri, and we found enough to show us that the rate was a blanket rate, but the movement was light, and I am not familiar with agricultural conditions in Arkansas, so I do not know whether that was due to the fact that we were looking for information in the wrong season, but we confined ourselves to the same month that we made our other figures on, and we found a very light cotton seed movement. I might say that what did move during the course of the fifteen days we figured on—25 cars of that—the blanket rate of 17½ cents was applied, on hauls ranging from 256 to 598 miles. The movement was light, cotton seed was not moving apparently.

3479 Exhibit 43, covering blanket rates on cotton from Arkansas and Louisiana, Oklahoma and Missouri to the eastern seaport points, principally to Boston and Boston rate points, quite a heavy movement of cotton, but the zones from which cotton moves on blanket rates were not large.

There are some striking illustrations, as for instance, out of a 75 cent rate from Newport to Boston, the Iron Mountain got 40 cents to St. Louis; it got 45 from Little Rock, 45 from Pine Bluff, 42 miles further south, and 45 from McGehee, 102 miles south of Little Rock. It got 55 cents from Ft. Smith, and cotton was hauled through Little Rock on its way to St. Louis, hauled about 165 miles further for a ten cent high rate; and there was quite a heavy movement from McGehee and Pine Bluff and Little Rock, and the points I have mentioned, and the range was not so much but it is a blanket rate, as I have stated.

Q. That is the originating end you are speaking of?

A. Yes, sir. That would not affect the Iron Mountain earnings because their portion to St. Louis is fixed, the arbitrary is to St. Louis, and the allowance east is a certain proportion of the rate—it is the balance of the rate.

Q. That would tend to show that the allowance east of the river also reflected the cost of service, by hauling it a thousand miles further to one point than to another?

3480 A. I think I stated that proposition exactly backwards; the lines east get 35 cents and the Iron Mountain gets the balance of the rate.

Q. How wide a zone is that in the east?

A. The short line mileage from St. Louis to New York is 1053 miles, and Boston is a little further.

Q. What is the widest scope of that territory that they got 35 cents for?

A. It has been so long since I have worked on eastern rates, I don't know that I can tell exactly; it takes in quite a large zone around Boston, and points north of Boston.

Q. They get that 35 cents whether it goes to Boston or Portland, Maine?

A. Whether it went to Boston and went through the expensive Boston terminals and went out to some point north; I don't know where the rate breaks, whether it is St. Louis or East St. Louis.

Q. The rate so far as we are interested in it, is 45 cents to St. Louis?

A. Yes, sir, from Little Rock, Pine Bluff and from McGehee.

Q. Take a shipment like this—what did you say was the rate from Ft. Smith to St. Louis?

A. 55 cents.

Q. Rather, that is the division?

A. Yes, sir, the Iron Mountain's proportion.

Q. Suppose instead of that cotton originating at St. Louis, it originated at Paris, Arkansas, 43 miles from Ft. Smith?

3481 A. I don't know as to that; our tariff which we had, only covered Iron Mountain stations, and did not show that, as Paris is not on the Iron Mountain.

Q. Take some other Iron Mountain points to illustrate the question, say Salisaw in Oklahoma?

A. The proportion of the rate from Ft. Smith is 55 cents; the rate from Salisaw, the Iron Mountain proportion of the rate would be sixty cents; as the haul increases the rate increases there; there is not as wide a range in these zones as there is in the lumber zones.

Q. They get five cents from Salisaw to Ft. Smith?

A. Yes, sir.

Our motive in discussing these propositions was this: We had asked Mr. Perkins to put in these maps after comparing the rates; we had no knowledge when we drew these things up from the tariff as to whether there was any movement under them; we did find, as I have detailed, we did find a lumber movement, and I investigated them all to see whether the movement was heavy or light and have made the showing.

Q. In Exhibit 38, the rates on grain and grain products from Missouri-Pacific stations to some Iron Mountain stations, shown on the map, what about that?

A. The forwarding territory, the producing territory, is marked as Zone "A" on the map, and the consuming territory, to which the rate applies, is marked "B."

3482 We found that there is a rate published in the tariff of 19 cents on corn and articles taking corn rates, which I will detail:

From 157 Missouri-Pacific stations in Missouri and Kansas, to each of 369 Iron Mountain stations in Missouri and Arkansas, that blanket rate of 19 cents applies, according to the tariff, on 45 different commodities.

We find a 23 cent rate on wheat and articles taking wheat rates from the same territory to the same territory.

The corn rate covers 45 different commodities, as I stated before, and their comparative weight and bulk, value and casualty risk is rather interesting.

For instance, under the head of casualty risk, a good many of the manufactured or partially manufactured articles, cereal articles, included in these corn rates, take the same rates as raw corn, and they are much more liable to damage in transit, although raw corn is subject to wet and rust; while it is true that new corn will heat and spoil, a car with a leaky roof might ruin a whole car of cereal products. We find under that head, rolled oats, oat meal, rye flour, chop feed, cerealine, and corn meal. It seems to me that those articles—and the tariff did not restrict the shape in which they should be packed, they might be packed in paper boxes for instance—would be much more liable to damage than corn itself, or oats; although oats takes the corn rate, the waste space in loading which has been dwelt on at some length, is marked; oats
3483 takes that corn rate; corn for instance, weighs 56 pounds per bushel; you can load the car's tonnage capacity in a given number of feet of car space, which is less than the space occupied by an equal quantity of oats, as oats weighs but 32 pounds per bushel.

Going back to the time that I was interested in furnishing cars to elevators, I recall that we used to load oats to the roof of the car without danger of overloading, but we did not dare do that with corn; we could not load corn above two grain doors, and that that was expected by the traffic men who made the tariff, is further indicated by the minimum weight specified; the minimum weight on corn is 40,000 lbs. for a car, while the tariff specifies a minimum of 30,000 lbs. on oats; the car's capacity being but 40,000 lbs., they expected to get 40,000 lbs. of corn in there, and but 30,000 lbs. of oats.

Q. And the same rate applies for both?

A. Yes, sir.

Again, on oat hulls, I should imagine they would be lighter than oats. I haven't any figures on that, but they take the same rate.

The movements under that tariff—there was quite a little of it—was found to be from Washington, Missouri, Herman, Holden and Independence, some from Omaha, Neb., some from Leaven-
3484 worth, Kansas, some from Atchison, Kansas.

We took the main line billing on the Missouri Pacific and Missouri River points, and found it moved in quite large volume; it is not quite as large a volume as in the case of lumber, but the

movement was there. The tariff was not what would be termed a paper tariff.

Q. The commodity did move?

A. Yes, sir.

Q. Go ahead.

A. While we were investigating that proposition, we found some other movements through the zone, through the consuming zone in Arkansas and beyond, from these stations up here in Missouri, at lower rates than zone rates.

Q. It cost less to haul it from there.

A. The rate on flour, which by the way took the wheat rate, from Herman, Mo., to McCrory, Ark., is 23 cents. We found flour moving from Herman, Mo., quite a little of it, moving right through McCrory, Arkansas, into Memphis at 12 cents; in fact, it went right through there to Jackson, Mississippi at 22¢, in connection with the Illinois Central.

We found a lot of flour moving from Independence, Mo., on which the rate to Arkansas in the zone was 23 cents; moving to points in the southeastern territory through Memphis—Atlanta, Augusta, Asheville, N. C., and points in Georgia and the Carolinas, at 14 cents for the Iron Mountain's haul from Independence
3485 to Memphis, although the rates to points in the zone through which the shipments would pass, was 23 cents.

Q. The cost of service was very nicely represented there.

A. Yes, sir—not only on the Iron Mountain, but to points in the southeast; I find the same proportion allowed lines beyond Memphis in half a dozen common points in the Southeast, Atlanta, Augusta, Marietta, etc.

Q. Let me see if I catch that; the revenue the Iron Mountain got from some point up in the producing territory to McCrory, Arkansas was 23 cents; if it went to Memphis through McCrory, the Iron Mountain got 14 cents?

A. Yes, sir, when it was destined to Southeastern territory.

3486 Q. What is the next map you have, Mr. Hamilton?

A. That exhausts the maps. Those were put in evidence by Mr. Perkins——

Q. Have you not a citrus fruit map there?

A. Yes, sir.

Q. I believe there are some matters out side of the maps in connection with those movements of which you made memorandum: Probably I had better take those up before we go to the citrus fruit.

A. I have some other items here, some lumber figures——

On the proposition of citrus fruit rates: from the Pacific Coast fruit belt. Applying through Arkansas, to the territories in the East, with the exception of Texas, the same rate applies from the entire Pacific Coast fruit belt, on lemons, to practically every station in the United States East of the Cascade range of the Rockies.

There are exceptions to that, but I have here a tariff which Mr. Perkins very kindly furnished, "The Trans-Continental Freight Bureau Eastbound Special Tariff on Citrus Fruit in car lots."

That tariff bears the Missouri Pacific number indicating that the

rates apply via its line, which I am informed they do, the Iron Mountain number being 5118-R. The tariff was effective during the latter half of 1907.

3487 It names rates of $1.00 per hundred pounds on lemons, to Colorado common points; Missouri River common points; Mississippi River common points; Chicago and common points; Cincinnati; Detroit and common points; Pittsburg; Buffalo; New York; Boston and common points.

The tariff refers to another publication of the same Bureau, which describes in detail the common points or territory of which these are the descriptive titles.

Taking that tariff we find that there are some exceptions to the application of the rate to several points East of the Rocky Mountains, except Texas, in the first instance, but they do apply to all points in Maine, Vermont, New Hampshire, Connecticut, Rhode Island, Massachusetts, New York, New Jersey, Pennsylvania, Maryland, District of Columbia, Ohio, Michigan, Indiana, Illinois, Wisconsin, Minnesota, Iowa, Missouri, Kansas, and to portions of Virginia, West Virginia, Tennessee, Kentucky, Alabama, Mississippi, Arkansas, Louisiana, North Dakota, South Dakota, Nebraska and Colorado.

Q. Now, take the practical effect of that upon our interstate revenues:

Suppose a shipment of two cars of oranges is made from Los Angeles, one stopping at Little Rock and the other at Boston——

A. The rate I quoted was $1.00 on lemons. I would like to add here that the same kind of blanket rates apply on oranges and grape fruit, in car lots, or oranges and grape fruit mixed with lemons,

3488 $1.15 to all of the points I have enumerated, except Colorado common points, to all of which the rate is two and one half cents less, according to this tariff. That takes in the points in Colorado, known as "common points."

Q. Take that illustration on the two cars shipped out of Los Angeles for the East, one stopping at Little Rock and the other going to Boston?

A. As I recall it, Mr. Ludlam put the different mileage on those hauls in evidence. I have not the figures here now.

At any rate, it is apparent that the haul from Los Angeles to Little Rock would be 1398 miles shorter than the haul to New York, passing through St. Louis.

From Little Rock to St. Louis is 345 miles and the short line mileage East of the River is 1053 miles.

Q. What would be the effect of that upon the revenue that would go into their accounts in the case of those two cars?

A. Somebody would have to shrink; either the Southern Pacific, the Texas & Pacific, the Iron Mountain, or the lines East of the Mississippi River. I haven't the division and don't know where the shrinkage occurs.

Q. That is not material. There is bound to be a shrinkage owing to the difference of more than one thousand miles and the difference in the haul for the same price.

A. Yes. For instance, take the lemon rate—I say "lemon rate"

because the Colorado common points take the same rate ex-
3489 cept on oranges—the lemon rate from the Pacific Coast to Denver would be the same rate as to Boston.

The same rate would apply to Omaha, Nebr., as to Portland, Maine.

The same rate would apply to Topeka, Kans. as to Philadelphia.

The same rate would apply to St. Paul, Minn. as well as to Buffalo, N. Y.

The same rate would apply to Little Rock, Ark. as to Trenton, N. J., to Chicago as well as some point in Rhode Island, say Providence; it would apply to Duluth, Minn. as well as Detroit; to Lincoln, Nebr. as well as Washington, D. C.; it would apply to Memphis, Tenn. as well as New York City.

I just want to say in that connection, that that goes to the general proposition of rate making and I think it is only fair to state that there was, during our period here, a light movement of citrus fruits over the Iron Mountain. Whether the season of the year was responsible for that or not I do not know. There was some, but it was light.

Q. Now, Mr. Hamilton, take up the next matter there.

A. There are some other movements from the Pacific Coast of somewhat similar character, such as dried fruits; canned goods and vegetables; dried beans, celery and some fresh vegetables, that
3490 move on somewhat similar blanket rates.

The tariffs are lined up the same way and cover practically the same territory.

I have some movements here over the Iron Mountain rails, but there are not any great majority of them.

Q. Substantially the same kind of rates as the lemon and orange rate?

A. Yes, sir. Just as an illustration: Here is some dried fruit. I have some twenty two cars in the first half of October, and find there is a blanket rate of $1.25 applying to Southeastern points.

For instance, here is a shipment of raisins from Fresno via El Paso, Texarkana, on the Iron Mountain to Memphis and delivered to the Southern Railway there at $1.25 through to Knoxville, Tenn., on which the rate from Fresno to Memphis is 90 cents from the coast to Memphis.

On an exactly similar shipment destined to Atlanta, Ga., the rates from the coast to Memphis was 83 cents, the balance for the line beyond.

Q. Then it depends on what the destination is beyond the River, how much it costs to carry it to the River in those instances?

A. Those are types. I have about one hundred cars, all told, of those various commodities.

Q. You had some lumber illustrations there, outside of the zone?

3491 A. In investigating the movement under the rates carried in our maps, we found quite a large movement where the rate shrank at both ends.

Q. The cost of service got less at both ends?

A. I cannot say as to that, but varying proportions were allowed the lines beyond the Iron Mountain-Missouri Pacific rails, as well as to the lines originating the business and giving it to the Missouri Pacific. The through rates being the same, the shrinkage necessarily came in in the intermediate haul, which in this case was by the Iron Mountain and Missouri Pacific.

Here is a movement of about 184 cars from the same lumber producing territory as we have discussed under our map, to Kansas City, but all of which originated on connecting lines in the producing territory and went to connecting lines at Kansas City.

Q. Kansas City was not in the connecting zone?

A. Oh, yes, but this stuff is going beyond Kansas City and did not move on the zone rate.

Q. It went to some point ultimately beyond the zone?

A. Yes, it went to Sioux City; Denver; Manhattan, Kansas; Colorado, and Nebraska points; Missouri points—those catch my eye from the detail here.

As showing the non-relation to cost of service of these rates, or at least some of them—I do not know which ones—I would like to make some comparisons from possibly 200 cars I have here.

3492 We found a movement from Alexandria to Kansas City, 812 miles, originating on various lines beyond Alexandria and destined to points on various lines beyond Kansas City.

The shipments were all of like character, consisting of pine and cypress lumber.

The Iron Mountain haul in each instance was the same, but its revenue ran the scale like this—these are cents per hundred pounds: 11 cents, 12 cents, 12½ cents, 13 cents 13½ cents, 14 cents——

Mr. MOORE:

Q. Can you not give the destination in connection with each of those?

A. I can, sir, but it will take some time to dig it out of here.

Mr. MOORE:

Q. Well, never mind then. We can get that later.

The WITNESS: Each of these is indicated here by the number of the waybill under which it was transported.

To continue with these figures—13½ cents, 14 cents, 14½ cents and 16 cents.

Mr. HILL:

Q. For exactly the same haul on the Iron Mountain rails that was the varying revenue received?

A. The Iron Mountain hauled 812 miles from Alexandria to Kansas City for those varying rates:

3493 Two cars of lumber at 11 cents; two cars at 12 cents; one car at 12½ cents; eleven cars at 13 cents; three cars at 13½ cents; seven cars at 14 cents; one car at 14½ cents; two cars at 15¼ cents, and two cars at 16 cents. Which of those rates reflects

the cost of service I am not qualified to state, but it appears, even to a layman, that all of them, as a matter of logic, cannot.

Q. You have a memorandum of the way bills reflecting each one of those movements?

A. The number, date and full description, showing the destination and the division allowed the line at both ends. That is the Alexandria illustration.

Now, this is a case, Judge Hill, where all these cars were received from connection at Alexandria and all were delivered to connections as Kansas City. Absolutely no difference in the service required.

The difference, if any, might be in the cost of service in delivering the car at Kansas City as between one line to another, but I do not know that that exists.

Q. It is not provided for in the tariff, if it does exist?

A. No, sir.

Now, take Smithton, Ark.; 600 miles from Kansas City:

3494 We found two cars moving at 9 cents; three cars at ten cents; seven cars at eleven cents; nine cars at twelve cents; four cars at thirteen cents; one car at fourteen cents; three cars at sixteen cents, running from nine to sixteen cents.

We found at Prescott, Ark., 618 miles to Kansas City:

Sixteen cars at eleven cents; one car at twelve cents; six cars at thirteen cents; nine cars at fourteen cents.

Now, comparing the differences in the haul, those are similar hauls at different rates.

We found the thirteen cent rate from Benton, Ark., 545 miles:

The same rate from Perla, 565 miles;

The same rate from Smithton, 600 miles;

The same rate from Prescott, 618 miles;

The same rate from Hope, 633 miles.

Now, each of those shipments that I have indicated—and there were several cars on most of them, moving at a thirteen cent rate for varying lengths of haul, from 445 to 633 miles—would cover the most distant ones—in other words, they are on the same main line of the Iron Mountain, Benton being the most Northern and Hope being the most Southern, the rate being level.

Q. It did not cost them anything to move it from the various points until it go to Benton——

3495 A. I found fifteen cent rate on four cars from Benton, 445 miles, and an eleven cent rate on two cars from Alexandria, 812 miles.

Except for twenty four miles, from Benton to Little Rock, those cars beyond Little Rock will travel over the same track. There is no difference so far as I know, in the operating conditions. There are many other illustrations here, and here is the other side of the proposition showing a much higher rate than even the Benton rate: 20 cents from Texarkana, 665 miles, as against eleven cents from Alexandria, 811 miles.

I have not enumerated them all (there are 184 cars on this sheet) but those are typical of the others, and they are all repre-

sentative of actual movements of lumber for which we have the waybill number, the date and the billing station.

I found along similar lines business moving from this same producing territory at Pueblo, and a comparison of the length of haul there would be interesting, I think.

I found stuff moving from Smithton, Ark., to Pueblo, 1022 miles, short line mileage, on a rate of 16 cents.

I found a 16 cent rate from Smithton to Kansas City, but 600 miles.

I found on business moving to Milton, Kansas—the Iron
3496 Mountain accepted on lumber for delivery to the Kansas City, Mexico and Orient, hauled from Monroe, La., at rates varying in proportion from 16½ to 19½ cents.

I found traffic moving through St. Louis, originating beyond the Iron Mountain, from the small lumber roads, and destined beyond St. Louis, moving from Hope, Ark., 458 miles, at 7½ cents, 11 cents, 11½ cents and 13 cents.

The total rate from Hope is 18 cents alongside of the 7½ cent rate——

Q. There could not be very much parity of rates between seven and eighteen cent lumber, hauled side by side.

A. The only explanation I can see, if they both represent the cost of service, is that the terminal service ate up pretty nearly two-thirds of the rate.

That covers the lumber situation. I have not given all of the detail. It is rather lengthy, but that typifies the rest of it.

Q. You have for inspection the data showing those movements?

A. Yes, sir, it is all here.

Q. What is the next?

A. We went into the cost of service proposition.

Q. Mr. Hamilton, there has been a great deal said in this testimony about the parity between the state and the interstate rates, the relation that exists between state and interstate rates:
3497 Have you made any examination as to that parity or relation, or whatever it may be called, existing between state rates and interstate rates?

A. Yes, sir.

Q. Give us the results of some of your illustrations?

A. Mr. Watson, and perhaps Mr. Perkins, or Mr. Flippin, one of the gentlemen from the Traffic Department of the Railroad interested here, as I recall it, said that the Arkansas distance tariff issued by the Commission dominated the rate from Memphis into Arkansas points, and that the Memphis rate was a bridge toll higher. That is, to get a rate from Memphis to an Arkansas point, they added a bridge toll to the distance tariff from Bridge Junction on the West side of the River opposite Memphis.

Taking that proposition first, I have made a graphic chart covering the rates from Memphis to the line of the Iron Mountain, extending South from Little Rock, some seventy miles, to Arkadelphia (actually to Gum Springs, the station beyond) and commenting upon the statement that Memphis rates were based on the Ar-

kansas rates, plus a bridge toll—that they were made that way—I found that the first class rate ran level across the chart———

Q. That is interstate?

A. Yes, sir.

That is, that the rate is seventy cents from Memphis to
3498 each of these twenty seven stations shown on this chart, which are seventy miles apart. That is, the most Northerly one is seventy miles from the Southern extremity of the route.

I found the Commission distance tariff beginning at sixty cents and mounting step by step until it reached seventy six cents, a fluctuation of sixteen cents.

Q. Owing to the distance?

A. Owing to the distance. It is graduated according to the distance. The rates are made in five mile graduates.

The rates published by the railroads from Memphis to these points, on first class, are absolutely level. That is, the seventy cent rate applies to the entire group.

The distance tariff rate, which I have compared with the Railroad interstate rate, is the rate from Bridge Junction, and would be, according to Mr. Watson's statement, the railroad's rate less the bridge toll. The bridge toll does not fluctuate. There is no distance element in it. It is an arbitrary toll. So that if the interstate rates published by the Railroads were based directly on this state rate, they also should fluctuate. As a matter of fact, the chart shows they do not.

The same is true of second class, which is absolutely level across the chart, on the interstate rate, and goes from fifty three to sixty eight cents in the standard distance tariff of state rates.

3499 On third class, the interstate rate goes 37 miles before it begins to climb, and then climbs, the last time thirty three miles, some six points; while the state rate begins at 45 cents and climbs in the direct relation to the first and second class state rates until it reaches 57 cents at the last station in the group.

The fourth class interstate rate runs 52 miles level before it begins to climb, although its predecessor, the third class rate, began to climb after thirty seven miles, and it ultimately climbs four cents; while the state fourth class rate, which is now, as it starts with the first station, a cent higher than the interstate fourth class, although the first, second and third class interstate rates begin on a higher level than similar state rates.

This state fourth class rate climbs all the way and is graduated according to distance, starting at thirty seven and reaching forty three.

Now, on Class A, which in these tariffs is higher than fifth class, and is therefore mentioned first, we find the interstate rate again absolutely level, although some rates between it and second class, which are absolutely level, have been graduated.

We find the state Class A rate graduated according to distance.

3500 The same is true of the interstate fifth class rate. It is level, while the state fifth class rate is graduated according to distance.

The state Class B rate is graduated almost exactly, relatively, to the other state rates, while the interstate Class B rate goes some 37 miles before it begins to rise.

3501 The state Class C rate is graduated, as is also the interstate Class C rate. There is some resemblance to the graduation on that one rate.

The same is true of the Class D, on the state, but not the interstate. It travels level for fifty-nine miles before it begins to rise.

The two Class E rates are most relatively graduated.

I should say that it is apparent there that there is no relation in that set of rates, between the state rate and interstate rate, for the reason that while the interstate in most instances is level—that is, is the same to the first station as to the last station in a group, the extremes of which are seventy miles apart, the state rate is graduated according to distance.

Now, as to the other phase of it, as to there being an internal relation between the interstate rates:

Something has been said here, for instance, that the fourth class should be a certain percentage of the first class, if rates were scientifically made—take these interstate rates: we found first-class absolutely level: second-class absolutely level; the third class graduated; the fourth class graduated; Class A absolutely level; fifth class absolutely level; Class B almost so, rising at the last two stations on the group.

3502 If there is a relation between the level rates, there certainly can be none between them and the graduated rates.

I am speaking from the chart—in this chart we have shown the names of the stations to which the rates applied.

Q. Have you carried any commodities on that chart?

A. Nothing but class rates on this chart. Down the side we have shown the rates per hundred pounds, in cents; each square across the chart represents a station; the graduations are shown in that way——

Q. I wish you would attach that chart as an exhibit.

The chart referred to is accordingly marked "Defendant's Exhibit C-1, T. A. Hamilton, 6/17/1910. M. J. C" and is in the words and figures following, to wit:

For Exhibit "C-1", see Volume 9, page 5853.

3503 Q. Have you made any comparisons of the relation to the St. Louis rates?

A. These are St. Louis rates that I have in this (indicating) chart. On the other chart we have shown only class rates and have shown the state and interstate rates on the same chart; that is, on the same page of the chart.

Here we have shown both class and commodity rates and have shown the interstate rates on one side and the state rates on the other.

The St. Louis rates, of course, are interstate rates, and are for the whole distance from St. Louis to these points in Arkansas indicated on the head of the chart.

For purposes of comparison, we have set against them state rates which apply for the distance that these interstate rates would cover, in the state of Arkansas. That is:

Here is the rate from St. Louis to Arkadelphia. The haul in Arkansas on that is 226 miles. Against that I have set over here (indicating on chart) the 226 mile distance tariff rate.

Inasmuch as the division of the rate is not in question, but only its relation, and further, inasmuch as the Iron Mountain in dividing the revenue derived from these St. Louis rates, divided on a track mile basis, the comparison holds good for any mile that the freight travels over.

3504 Q. Now, please explain what you have on that chart.

A. The first class rate from St. Louis to stations—from the asylum in Arkansas, which is the first station south of Little Rock, to and including Gum Springs, the first station south of Arkadelphia.

The first-class rate is $1.00 to all those stations from St. Louis.

Q. That is represented by a level line?

A. Yes, sir, and so marked on the chart.

The state rate for the same haul in Arkansas is set opposite that and graduates from 64 to 77 cents.

Q. Graduating according to distance?

A. Yes, sir.

The second-class rate from St. Louis to these points is eighty-five cents, to all of them—a level line across the chart.

The Distance Tariff state rate graduates.

The third-class rate, interstate, travels thirty-seven miles before it is graduated.

The third-class rate, state, closely follows the first and second-class rates, state, graduated all the way.

Mr. MOORE:

Q. You mean interstate?

A. No, the interstate does not. The state rate preserves, in a measure, the relation, but the interstate does not—two of them are flat and the next one is graduated on the interstate.

3505 The fourth-class interstate rate runs out a distance of 214 miles before it begins to rise.

The fourth-class state rate is graduated all the way, although not so markedly as its predecessors, the other three rates.

The fifth-class rate, interstate, is absoluely level.

The fifth-class rate, state, is graduated. Not as markedly as its predecessor, but graduated according to distance, nevertheless.

The Class A rate, interstate, parallels the fifth-class rate and is absolutely level.

The Class A rate, state, is graduated.

The Class B rate, interstate, does not begin to rise until it has traveled thirty-seven miles.

The Class B rate, state, is graduated in the first eight miles and goes up—that is, the first ten mile group.

The Class C rate, interstate, runs forty miles before it begins to graduate.

The Class C rate, state, is graduated exactly as is the Class B rate, beginning in the first ten miles.

These other rates speak for themselves and show that while a great many of the class and commodity rates, interstate, are blanket rates or level rates, the state rates are all graduated, preserving a closer internal relation between the various state class and commodity rates than there is preserved between the interstate, and lacking
3506 a proper internal relation of each, I fail to see how there can be any relation between the two sets of rates.

Judge HILL:

Q. Have you some commodity rates there?

A. The commodity rates are on agricultural implements, less than carload. That is an absolutely level rate, interstate. In fact, it is really the second-class rate, although it is published as a commodity rate. The same rate, state, is graduated exactly; that is, the second class rate follows it all the way, step by step.

Q. That is, a relation of a flat rate with a graduated rate?

A. Yes, sir.

The carload rate on agricultural implements, interstate, is graduated all the way, but the less than carload rate on these implements is a flat rate.

If the relation between carload and less than carload, interstate rate on implements, at the first station, was correct, then the relation at the last station is distorted, because there is not a level rate on the less than carload, while there is on the carload. To put that into figures:

The less than carload rate from St. Louis, on agricultural implements, say to Mabelvale, Arkansas, is eighty-five cents. The carload rate is thirty cents. Now we go to Arkadelphia and we find the less than carload rate still eighty-five cents, but the carload rate has gone from thirty to thirty-nine cents. In either one
3507 of those cases there is some distortion of relation.

Q. I expect there is a physical condition down there that makes the handling of carloads very much more expensive than less than carloads over that particular piece of track.

A. I should say that there was some commercial necessity for a lower carload rate to some of those points near Little Rock that there was further away. What it is, I do not know, but that may be the cause in the change of the relation.

Now, comparing carload and less than carload and showing that this tariff is not related, the same statement holds goods on "bagging and ties."

The carload rate is a level rate of nineteen cents to each of these twenty-seven stations, while the less than carload fluctuates from thirty-nine to forty-six cents.

If there is a definite relation, whatever it is, between that carload and less than carload "bagging and tie" rate, it is not apparent at just which of these two points that relation is.

Q. The parity has gone awry?

A. If it is there to begin with it is not there as you go down the line; or if it is there at the end, it was not there in the beginning.

Q. You don't know whether the parity belongs to the first or the last end——

A. No sir. We have a similar condition on the "canned
3508 goods," but in this case instead of it being the carload rate that is level, as in the case of the "bagging and ties" it is the less than carload; the carload fluctuates and disturbs the relation.

We have a level rate on salt, less than carload, the same to each of these stations, while the carload rate fluctuates, just as in the cases of others I have spoken of.

Now, in the state rates it is true that the implement rate, for instance, less than carload, is not graduated exactly as the carload is, but there is some graduation in both and they more nearly approach a relation of some character than the interstate rates do, because they — both graduated, while in the case of the interstate one is level and the other graduated. That is the point I had in mind. The lines on the chart speak for themselves.

Q. Will you attach that chart as Exhibit D-1? Are the numbers there?

A. Yes, the tariff numbers are quoted on each chart. I have the tariffs here. They were very kindly furnished by Mr. Perkins.

Q. Mr. Hamilton, summing up your investigation of the reflection of the cost of the service in the rates, I wish you would state what conclusions you have reached as to how rates are made, as the result of your experience before you began investigating these cases, and the result of your experience after going through these cases to which you have heretofore testified?

3509 A. Before doing that, I will attach this chart as an exhibit.

The chart last referred to is marked, "Defendant's Exhibit D-1, T. A. Hamilton, 6/17/10, M. J. C." and is in the words and figures as follows, to wit:

For Exhibit "D-1", see Volume 9, page 5855.

3510 A. Now, answering your last question, I would like to say in that connection, Judge Hill, that except in a perfunctory way, I have never been charged with the duty of making freight rates for promulgation to the public.

In my experience with the L. & N., I have been called upon in the daily exercise of my duties as a rate clerk and bill clerk, to make a great many rates on a combination basis, defeating published through rates.

I gave a great deal of thought and study to the rate conditions in that territory—southeastern territory—for a good many years. I had to do it to earn my bread and butter. I saw those rates in their daily application, covering practically all the territory east of the Mississippi River and south of the Ohio and Potomac Rivers, and

I do not believe that there is a more complex territory, from a rate-making or rate-applying standpoint, in the world.

Rates were made down there—or at least they appeared on their face to be made—so no sane man could understand the reasons for them. Certainly a great many of them were made without any relation to the cost of service. I would like to illustrate that just a little:

The Mississippi Valley tariffs to common points in the New Orleans group, carry from St. Louis a great many commodity rates.

For instance, the rate on soap from St. Louis to Mobile,
3511 was twenty-eight cents. The rate applied from the west bank of the river. The L. & N. paid the river transfer, as did all of its competitors, the Illinois Central, the Mobile and Ohio and the Southern Railway.

The rate to points directly north of Mobile, through which Mobile traffic would pass on its way from St. Louis, were almost double the Mobile rate.

The shippers here in St. Louis would secure what we called "combination rates." They had the privilege of shipping their stuff to Mobile at twenty-eight cents and shipping it back at the local rate, making a much cheaper rate than the local rate to any intermediate point. As I recall it, those rates reached clear back to Montgomery. That is, we could make a combination rate cheaper than the straight of way local as far back as Montgomery, and not only that, but when you made the combination on Mobile, you made a St. Louis rate which absorbed a transfer. Your local rate was an East St. Louis rate, which did not.

That is just one illustration of a great volume of rates that we made in that way.

I recall that we had a considerable movement of stoves into interior Georgia points, and we found that in the every day application of the rates we could make a cheaper rate by applying the rate
from St. Louis to Jacksonville, Florida, and the local rate
3512 back into the interior of Georgia, than the published straight rate to the interior point. That came about by the fact that the rate from St. Louis to Jacksonville is built on the rate from St. Louis to New York, plus the water rate down——

Mr. MOORE:

Q. Were those rates in force in 1907 and on these roads involved in this litigation?

A. I think that the Iron Mountain—in fact, I know that at that time the Iron Mountain was a party to the same Mississippi Valley and southeastern rates. The Mississippi Valley traffic of the Iron Mountain passed through Arkansas, but their southeastern stuff went largely through Belmont, Missouri, or Columbus, Kentucky. I know we used to compete with the Iron Mountain for traffic——

Q. When were those rates in force?

A. When I last handled them was in 1905. I was explaining my familiarity with the application of rates.

Q. You are stating facts here now in regard to rates. I do not think it is competent to state such facts as this— —

Mr. HILL: You had your witnesses stating their experience in Minnesota, Wisconsin, Canada and other places.

Mr. MOORE: But I did not have them stating details such as Mr. Hamilton is stating.

Mr. HILL: I want Mr. Hamilton to show he had some dealings with rates.

3513 Mr. MOORE: I have no objection to that, but he is going into detail as to what the rates were on these lines——

The MASTER: That is the only way to show his familiarity.

Mr. MOORE: I want to note my objection to his going into such details.

The MASTER: Very well.

The WITNESS: Another instance of making rates to meet the necessities of traffic, regardless of the cost of service, was a set of rates we had in another matter, East St. Louis to the Ohio River, on grain destined to the southeast.

We got grain delivered to us at East St. Louis that originated west of the Missouri River, as I recall it, and if it was properly reconsigned through the Southern Freight Committee—virtually a milling-in-transit arrangement, we hauled it to Evansville, Indiana, for one cent, and if it originated in Missouri locally we got four cents for the same haul. If it originated in an East St. Louis elevator with no indication or surrender of tonnage beyond St. Louis, we got 6½ cents for the same service.

We had what was known as a proportional rate on grain, which was the same as that. We had a connecting link between Henderson, Kentucky, across the river from Evansville and Louisville, which was much shorter than our own line through Guthrie——

3514 The MASTER: The witness is now stating what occurred two years before, in the actual operation of another road.

Mr. HILL: Just leave out the illustration and state, generally, your experience.

A. It was along those lines, the handling of rates, not the making of them, their practical application to the every day traffic, and applying that division of them between our line and other lines; work of that character. The building up of rates where we found that the fabric of our through rates could be defeated by combinations. It required quite a study; not only of the railroad I was with, but all of our competitors in that territory.

That lasted some five years, that actual every day experience in meeting these problems and applying them to the freight traffic of my employer, the railroad company.

I have listened with a great deal of interest to what has been said by the gentlemen in this case regarding rate-making and it coincides quite a little with my experience in applying rates, and I would like to summarize that with my best thought on the matter.

When a railroad traffic man states that the cost of service is considered in making rates, he undoubtedly has in mind the ideal con-

dition. But as a matter of fact, the basis of his rates, owing to the manner in which they are adjusted from time to time—patching a new rate on to the old—must necessarily be tradition and precedent, and it would be necessary for the origin of that tradi-
3515 tion and precedent to go back to the very genesis of railroad rate-making. Assuming that even at that time the first schedule of rates had a cost basis; that the road knew its costs and added a certain percentage of profit to that in making its freight rates—we would have to assume it knew its cost by actual commodties, but even that is doubtful, because the first railroads had to meet stage and wagon competition, as well as canal boat competition. Stages and canal-boats were there before we had any steam engines, and if they had to meet that competition they had to meet the cost ideas of the canal-boatman, the stage driver and the man who drove the freight wagon.

If that is the basis of the present rate fabric, and rates are made by readjusting and re-arranging, patching, extending and contracting existing rates, I feel that any traffic man will bear me out in my statement.

That does not seem to be cost foundation, to begin with. If a traffic man has any idea at all as to the cost of service, it must necessarily express itself to him in some specific terms—he must have a unit, a yardstick to measure by.

The freight service rendered by a railroad consists of the movement of weight over distance, and as a usual thing, he takes a ton, or a fraction of a ton, as his weight unit, and a mile as his distance unit, and from those two he secures the ton mile. That is,
3516 if he has any idea as to cost, it is ton mile cost, and unless special tests are made, he has no specific ton mile cost by commodities. He has the average cost. He has the total operating expenses of his road, or the division of his road, divided by the ton mile of all classes of traffic, silks and satins, baskets and bar iron, etc., as the case may be, and that is, under present day railroad statistics the only information he can have as to cost unless he makes a separate test as to the cost of each individual commodity on which he makes a rate.

Now, if we assume that the ton mile cost of transporting each individual commodity on a given line of railroad was known to the traffic manager of the road and he desired to make his rate based on that cost, plus his percentage of profit, it is a grave question how far he could go in that direction. Certainly, he could not go beyond the first junction where he met short line competition. He would have to meet his competitor there, and his cost ideas, or go out of business. He could not go beyond the first navigable stream where he would meet boat competition with rates made on a package basis in many instances, as in the case of many commodities between St. Louis and New Orleans, and St. Louis and Memphis.

The traffic manager's duty to his road is to build up the traffic of the road. That is what he is there for—to get something to put into the car, and to get out of the traffic all that he can, not only
3517 currently, in dollars and cents, but in future traffic.

He must foster the industries on his own line and protect

them in marketing their product. He must equalize not only local labor and raw material, supply conditions between industries on his own line, but protect them in their competition along those lines with industries on other lines. He must put them in the market if he wants to live, and if they want to live. If I may make the comment that would be excellent rate making to do that. That is what the railroad is there for, to handle traffic, to get traffic, and get out of it what you can. You have a plant there: make the fullest use of it. The fuller use you make of it the more you spread your overhead and fixed expenses. It would perhaps pay you to take stuff at what might be, in conjecture, an unremunerative rate, rather than run the empty car. The traffic man should preserve to the jobbing centers, their natural distributing territories. He aims to do that. Whether it is good public policy, I do not know. I am not competent to say, but from a railroad standpoint he aims to do that. He tries to protect them in their markets and considers their geographical location one to the other, not only with relation to the consuming points which they serve, but also as to the manufacturing centers that they draw their supplies from.

It is a great question whether a traffic man could solve all these problems and meet so many different conditions of operation
3518 and cost on other lines, and so many other traffic men's ideas of what rates are profitable, and still adhere to a basis of actual cost plus a percentage for profit.

Another thing we must consider is the question of reciprocal loading for his company's cars. He must endeavor to create traffic to reduce the empty car movement; and balance his tonnage movement as far as he can; keep his power balanced on the road and keep his empty cars filled.

To create traffic he must offer inducements to the shippers and his most potent inducement is a favorable rate, one that will open up new industries and produce traffic to fill up the empty cars.

As a matter of fact, a traffic man gets out of such traffic as high a rate as he can, but he must be satisfied with what the traffic will bear, or the industries will not open and his cars will come back empty.

This reciprocal traffic must be considered, too, in making rates on business in the opposite direction where the volume of traffic is, where the predominating traffic is, as the fewer empty cars you have to haul back, the less burden of that empty car movements cost your outbound traffic will have to bear.

Rates to and from large territorial zones are made by freight committees and tariff bureaus, for all the roads operating in the territory affected, and while each road has nominally a voice in making the rates so promulgated, still the views of all or the majority of
3519 those roads interested must be met and harmonized. If they did not do that they would not promulgate the rate.

Rates made in this way are applied by divers routes and the length of haul, and general operating conditions, I would say are seldom, if ever, the same on any two roads between any two given points. For instance, the rate from St. Louis to Kansas City, first class, has been for years and still is 60 cents:

The same rate applies, via the Alton, Wabash, Rock Island, Missouri Pacific, and even via the Burlington, via Hannibal—there is a difference in the mileage and in the way the roads are operated—that is the point I was trying to illustrate.

Surely rates made on the bureau plan are not based on the operating cost of any one railroad interested. Rates so made often operate to keep down rates to an intermediate and strictly local points where the conditions and cost of operation are entirely different. I can think at the present time of no better illustration of that than the trans-Missouri rate. Many rates on the Wabash, for instance, from St. Louis to points between St. Louis and Omaha, are absolutely dominated by the Omaha rate.

The interstate commerce Act prohibits the charging of a greater rate for the shorter haul than for the longer haul over the same road, in the same directions.

3520 The Omaha rate of 60 cents from St. Louis is based on the Hannibal, St. Joe rate—at least, so I am told, and in any event, it is the same as the St. Louis-Kansas City rate.

Combination rates are authorized by many railroads. That is, the through rate to a given point for a longer haul, plus the local rate back to an intermediate point makes a combination that is lower than the rate published direct to the intermediate point.

It is plainly apparent that the cost of service is not considered in making both these rates. It may be considered in making up one.

That sums up what I gathered from the situation and listening to the testimony of traffic men in this case.

Q. Those are the reasons, as you understand them, why there are other conditions and considerations than the cost of service that produce the rate factor?

A. Yes, sir.

Q. I believe you started with the assumption, or the theory that the rate did not represent the cost of the service, and you have given your reasons why it did not?

A. Yes, sir.

Q. Now, to go one step further: take the evidence that has been introduced in this case as to the rates—principally this which you have been developing—which it is apparent does not represent the cost of service in the instance given: I will ask you what is your opinion as an accountant, based upon the experience that

3521 you have had in the accounting problem, of using the revenue derived from these rates, or rather, these two sets of rates, interstate and intrastate rates, to measure the cost of operation of business, state and interstate?

A. I would say in that connection that I agree most heartily with Mr. Nay. As I heard him say in this case, the value of the revenue basis is predicated or is dependent entirely on the assumption that the rates are based on the cost of service.

I think that it is a plain proposition, and as a matter of plain logic, if your revenue is derived from rates which are not based on the cost of service, it is mathematically impossible to accurately divide those expenses on the basis of factors derived from that revenue. If there

is no relation between the revenue and cost, I cannot see how you can use the revenue to divide cost.

Q. In your experience as an accountant, have you known the revenue basis to be used as a method of ascertaining the cost of production?

A. No, sir, never.

My first acqauintance with the revenue basis for dividing operating cost or cost of production was in the Missouri rate case where it was presented by the railroads.

3522 Q. I call your attention to the further statement made by Mr. Nay, that the revenue theory was not only dependent upon the cost of service, but also dependent upon their being a proper relation of cost between the state rates and the interstate rates, and ask you, from your experience with the rate situation in Arkansas, whether there is such a relation in the state and interstate rates so that those could be used as the two yard sticks with which to measure the cost of service of that respective kind of business?

A. There may be rates published effective in Arkansas, which are built in that way, but they are few.

When you consider the whole rate fabric as I have found it in going through the company's way-bills, which are records of actual movements, as I have been illustrating from these lumber and other movements, considering it all, there is not any such thing. If there is, we have not been able to find it.

Q. Take, for instance, this: What relation could there be between the lumber moving interstate on these various tariffs that you have put into evidence and the lumber moving within the state on standard distance tariff?

A. I think I have made illustrations this afternoon to the effect that the further you haul the lumber the lower the rate you can get. I know the standard distance tariff increases the rate according to distance.

Q. That makes the relation or parity between those an impossibility.

3523 A. Yes, sir, that is a good instance of it.

Mr. HILL: That is all of the direct examination at this time, but I will reserve the right to recall Mr. Hamilton later, if necessary.

3524 CONWAY W. HILLMAN, a witness of lawful age, being duly produced, sworn and examined, testified on behalf of the defendant as follows:

Direct examination.

By Mr. HILL:

Q. State your name, age, residence and occupation?

A. Name, Conway W. Hillman; age 53; occupation Public Accountant and President of the Mutual Audit Company of Louisville, Kentucky; place of residence, Evanston, Illinois; place of business, Paul Jones Building, Louisville, Kentucky.

Q. How long have you been in the business of a public accountant, Mr. Hillman?

A. For about four and one-half years.

Q. Prior to your work as a public accountant in what business were you engaged?

A. I left college——

Q. Just give a brief biography of your work, if you please. I will not interrupt you but ask you to go on and state in your own way.

A. In 1873, graduating from Dickinson, at Carlisle.

I went to Lafayette College in Easton, Pennsylvania, and took a course in civil engineering, graduating from there in 1874.

3525 In the Fall and Winter of 1874 and Spring of 1875, I was engaged in engineering work on the Cumberland Valley Railroad, one of the Pennsylvania lines running southwest from Harrisburg, Pennsylvania, to Martinsburg, West Virginia, and also some engineering work for the Quincy, Alton and St. Louis railroad, then an independent line and now part of the Burlington system, I believe.

I then determined to enter the operating department of the railroad and went into the office at Carlisle, Pennsylvania, and acted as messenger in order to learn the business of telegraphing.

I then went to Harrisburg, Pa., as telegraph operator for the Cumberland Valley road, in 1876—the date, I believe, was the first of May. I served the Cumberland Valley Railroad in various positions, as ticket agent, freight clerk, scales clerk, yard clerk, agent and as assistant dispatcher stationed at Harrisburg, Pa.

I then went to Chambersburg, Pa., the headquarters of the road, and was the superintendent's clerk, transferred very shortly to the position of assistant dispatcher at Chambersburg, the headquarters of the road.

I retained that position until the Fall of 1880, when I resigned and took a position in the treasurer's office of the Northern Pacific Railroad, in New York City. My duties there were that of stock bookkeeper. I mean by that, keeping the record of the transfers of the capital stock of the road.

3526 Six months afterwards I was made transfer agent of the road and had charge of the transfers of both stocks and bonds.

I worked in various capacities in that office for seven years, when I was elected assistant treasurer of the Northern Pacific road, with headquarters in New York City.

In 1891 I was transferred from the New York office to the Chicago office of the Northern Pacific road, the Northern Pacific having then leased the Wisconsin Central and obtained control of the terminals in the city of Chicago, now principally known as the "Chicago Terminal Transfer Railway."

Their express business was transferred from St. Paul at the same time and placed under my charge.

I served the Northern Pacific in this capacity at Chicago until 1893, when they went into the hands of a Receiver.

I then served the Receiver for eighteen months, until 1895, when

the control of the road having passed into other hands, I left there and took the auditorship of the Metropolitan West Side Elevated Railway Company in Chicago, which is an electric road, and the first—or almost—of its kind in the country.

I devised its system of accounting and placed this system in consonance, as far as possible, with requirements of the Interstate Commerce Commission.

3527 In 1903, the management of this road changing, I left there.

I went back to the Rock Island road for a year—probably a few months longer than a year. I went to work in the Assistant Comptroller's office, under Mr. J. L. Kramer, who is now comptroller and vice-president of the C. H. & D. road of Cincinnati.

I had special charge in that road of the insurance matters, having been in that line when I was connected with the Northern Pacific.

I left there and attempted to establish myself as a public accountant.

After varying fortunes in this regard, I became connected with the firm of Baker-Vawter Company in their accounting department. These gentlemen have a large manufacturing interest in loose-leaf ledgers and labor saving devices, and incidentally to that they have found it necessary to establish an accounting department.

I stayed with them a year and four months and left them to take the position of Cost Accountant for the Indiana Audit Company, at Indianapolis, Indiana.

I left the Indiana Audit Company after 60 days, owing to the fact that the Company was, as I found, an insolvent concern. They are out of business now so there is no harm in mentioning this

3528 fact. That is the reason of my having left them.

I then established, in connection with Mr. William H. Gleason and some Indianapolis men. The Mutual Audit Company, the present incorporation.

At this time we obtained the work of the Kentucky Railroad Commission in their suit over the two cent rate and the reduction in freight rates and we found it desirable to move our headquarters to Louisville, Kentucky, where we have since remained.

From that time on I have been almost continuously in the railroad accounting business for various railroad commissions, the exception being about three months of an interval when this work not being active, I engaged in our other branch of business, the general accounting work.

Q. Mr. Hillman, what railroad commissions have you represented, if you have no objection to stating?

A. The Kentucky Railroad Commission, North Carolina, Alabama, Florida, Minnesota, Illinois and Ohio.

I have at present also been engaged (but have not yet done any active work) by the Commission of Indiana.

I was also called into consultation for a short time in the Missouri Rate Cases, but my work for them was merely advisory and in the nature of stating what we could do provided we could have the time

to obtain the necessary information. But as Missouri was unable to obtain this extra time we practically did nothing for them.

3529 Q. Your work has necessarily made you familiar, I presume, Mr. Hillman, with the "revenue theory," as it is commonly called, that has been adopted by the railroads in this case:

That is to say, they seek to divide the property devoted to state and interstate business on the basis of revenue received from each class of traffic and seek to divide the expenses of operation between each class of business—from the revenue received from each class of business:

I will ask you if you have given that theory any investigation and thought?

A. Yes, sir; I have.

Q. I wish you would state your views in regard to it.

A. I consider the earnings or the "revenue basis" as an illogical proposition.

I consider that it has been adopted in a number of cases and decisions rendered upon it because it was the only factor bearing upon that subject which had been presented to the courts, and necessarily the court, as I understand it, not creating its own factors, it was used. I, therefore, feel that in making this criticism I am not putting myself in antagonism with any decision of any United States court in making these criticisms.

3530 The first reason is that in the use of this factor, the earnings equalized the operating expenses; all matters are handled on the same percentages.

This leads to the second point, that an unjust rate, one which is producing too high an operating revenue, would be enabled to perpetuate itself by having assigned to itself a high operating cost, and the converse of that proposition, which is that a non-renumerative rate, one causing a loss, would also tend to perpetuate itself by having assigned to itself a low operating percentage.

Also, the contention on the part of carriers of the inadequacy of a rate and the contention on the part of the State of the unjustness of a rate, would necessarily in each case, be measured by the yard-stick that is in dispute, which is the earnings.

We can illustrate that, perhaps, by taking the comparison of roads having a longer mileage than other roads between certain points; that is, a road which is in competition for a large portion of its business with short line competitors. This road must necessarily spend more money in handling trains because it has a longer haul and, therefore increase the cost of what you might call the "haulage expenses" and it also must offer extra inducement in the way of equipment in order to obtain the traffic over its longer road, or it must have more expert traffic men solicitors who can obtain

3531 the business for them, even under these adverse conditions, and such men come high and must be paid higher salaries than the average run of trafficmen.

Yet, under this plan of the gross earning basis, the relative expenses on these two roads would be measured by the earnings and it alone.

This is quite forcibly illustrated in the Minneapolis and St. Louis road, which is one of the parties to the rate case in Minnesota.

This road is in competition with other roads for Chicago business. The route from the twin cities to Chicago is over the Minneapolis & St. Louis to Albert Lea; from Albert Lea to Chicago over the Illinois Central.

In handling the grain business from the west the Minneapolis & St. Louis, together with other roads, are compelled to grant a mill-in-transit privilege at the various mills along the road, principally those at Minneapolis.

The result is that on this rate the Minneapolis & St. Louis will take a carload of grain and haul it to Minneapolis at its local rate. If this car is destined to Chicago, or the product of this car after milling is destined to Chicago, the road is then compelled to haul this car from Minneapolis to Albert Lea, 113 miles, without receiving any compensation whatever, the entire proportion of that through rate going to the Illinois Central road. Therefore, on the carload
of grain passing locally from a point in Minnesota to Minne-
3532 apolis, the M. & St. L. will collect the full rate. On another
car going the same way, to Minneapolis, being milled in transit and then proceeding on its way to Chicago, they will obtain exactly the same rate, plus two dollars per car for the privilege of milling-in-transit.

As the expense of milling-in-transit amounts to something, the practical result is that the earnings on a car from the western part of southern Minnesota to Minneapolis, and the earnings on another car from the same point to Minneapolis and thence southward to Albert Lea,—a distance of 109 miles—are the same, while the expense of handling must necessarily be larger.

This condition of affairs is borne out by the analysis of the M. & St. L. accounts and is used by me as an illustration of the unfairness and inadequacy of the earnings basis for a division of expenses.

Where this method is used, as it is often used by railway companies for the division of expenses, first adding an arbitrary varying from 15 to even 100% as an extra charge, or an extra cost of carrying intrastate freight over interstate freight, this inadequacy and unjustness of the earnings method is accentuated.

The usual method of applying that is to consider that it costs 15% more of the gross earnings to do one class of business than the other,
regardless of how those gross earnings may be made up,
3533 whether on a ratio of intra, two and inter, one; or whether
that ratio is intra-1¼ and inter-1.

To the earnings, intra, will be added the arbitrary percentage of 15% or more. To that result will be added the entire earnings and a repercentage taken of the total, and that repercentage is used in the case of this arbitrary addition of the amount which we assume to be 15%, as the percentage of expenses which should be charged to intrastate.

This is the method adopted by the Chicago & Northwestern Railway Company in their exhibits, in the case against the state of South Dakota.

Q. Mr. Hillman, you are stating the matter too modestly for the railroads in this case: they charge from one to four hundred percent on the freight and 25 to 50% on the passenger, intrastate, extra expenses.

A. I left a little margin. I said "15 per cent or more."

Q. It is the "more" proposition we are up against here. Did you finish?

A. I have finished concerning the expenses. I believe your question, if I recollect it correctly, also asked concerning the apportionment of the property——

Q. Before you go into that, I want to ask you a question on the subject of expenses:

Has your attention been called to a claim of a parity or relation between the rates, state and interstate as affording a mean by
3534 which the two classes of traffic could be measured, the revenue produced from these rates? Have you made any investigation as to that phase of the question?

A. I have given no investigation to that phase of the question, personally. Of course, in the hearings where I have been, that matter has been up, more or less, and has been discussed, and I will say here, very much in the same manner of the showing of Mr. Hamilton yesterday on the stand.

As an illustration, in showing graphically the rates which were in existence on railroads and which were proposed by the Minnesota Commission, I had made a graphic representation of those, using first class only, to show how they would work out. I had not presented it in the Minnesota case, but it was referred to in that by me in my testimony.

Q. Is there any such relation between them, so far as your investigation as an accountant went——

A. No, sir; I should say there was not.

Q. This chart that Mr. Hamilton exhibited as showing the non-relation of the two, is in conformity to investigations you have made along the same line?

A. As I said, my investigations in that line have been quite limited. It is in conformity to other testimony which has been given and in which I was an auditor—or rather, a listener.

3535 Mr. Moore: Do you think that is competent evidence to bring into this case, testimony of what Mr. Hillman has heard in other cases?

Mr. Hill: No, not testimony, but information which he has gathered from the testimony.

The Master: He refers to that as being the foundation, the source of his knowledge.

Mr. Moore: Very well; if you take it that way.

Mr. Hill: I am not seeking to introduce testimony given in any other case——

The Master: No; but the source of knowledge.

Mr. HILL:

Q. I wish you would express your opinion, as you started a few moments ago to do, about the division of property the reveuue basis, and what in your opinion would be a proper basis on which to divide it.

A. In the division of property I do not consider that the revenue basis is the proper one to show the amount of the property used in the transaction of the different classes of business.

I do consider that the expense basis is the proper basis for the division of the property.

The reason for that is, that in making up the expenses which go against the different classes of business, I, in my methods, have used those factors which reflect the use of the property. I have used the tons, ton miles and train costs, under the varying conditions of local and through.

3536 I have used passengers and passenger miles.

I have used the terminal expenses and endeavored in each case to use the factor which expressed the use of the property, the result being that when the operating expenses were assigned between the different classes of business, intrastate and interstate, passenger and freight, that those expenses reflected the use factors and therefore the property which was in use by the railroad company. However the value of that property may be determined as an entity is reflected by the expenses and by that factor only.

Q. Mr. Hillman, have you read any authority that represents your views upon this subject of the revenue basis, that you can endorse as a correct statement of it?

A. Yes, sir.

Mr. MOORE: I object to the question.

Mr. HILL: We have read into the record on both sides authorities to support opinions. Mr. McPherson commenced it by reading a good many statistics and statements from well known authors. There are several instances where you have done it and we have done it.

Mr. MOORE: That is all very well as to statistics, but not as to authors. The authors themselves are more competent witnesses as to their views. I could cross-examine the authors but I could not cross examine——

Mr. HILL: Both of us put in Noyes' work—I don't remember the name of it.

3537 The MASTER: That was not objected to. I think this would be incompetent in this connection.

Mr. HILL: What we want to read into the record is an opinion that Mr. Hillman called my attention to, what he says reflects his views on this subject, delivered by Judge Farrington, as an analysis of the figures practically as Mr. Hillman has analyzed the figures here, and it seems to me that it is very competent for a matter of that kind to go into the record in support of his views.

The MASTER: I do not think there would be any objection to his stating simply that he had read an opinion of Judge Farrington sup-

porting his views. Go that far with it, but I would not read the opinion into the record.

Mr. HILL:

Q. Is this the opinion you have in mind—I will give the page number here—the Southern Pacific vs. Biatine, 170 Federal Reporter, page 725?

A. Yes, sir.

Q. Mr. Hillman, having given your reasons for discarding the revenue basis or theory of dividing expenses between state and interstate, I would like for you to state, without going into detail, the general principles upon which, from the standpoint of an accountant—by that I mean a practical railroad accountant—that such division should be made?

3538 A. The general principles, as I have stated are to use those factors which show the use of property. I have taken each operating account, 108 of them I believe, and have assigned each of those operating accounts upon the use basis between the inter and the intra—do you want the detail?

Q. No, first the general principle, and then we will go into the detail a little later. I want the underlying principle for doing that.

A. The underlying principle is that when an expense is intrastate, it is incurred for a certain purpose. That purpose necessarily is reflected by some portion of the railroad by the movement of a train, by the movement of a switch engine, by the work of the men on the platforms, in freight; the work of the men across the ticket window in the passenger; the agents' general work of way-billing, ticket reports; the telegraph man; dispatching; the operation of signals; repairs to the track; the maintenance of equipment, and each one of those is undertaken according to the work which is on hand, interstate or intrastate, and is measured by a certain factor which shows the relation of the inter and intra business accomplished under that special heading, and, therefore, it is divisible upon some factor which represents it, which factor we have taken in detail with each account.

Q. In other words, you would not use any one factor to determine the whole division, but use each appropriate factor for what you consider the appropriate sub-division?

3539 Yes, sir.

Q. And work it out in detail in that way?

A. Yes, sir.

Q. Have you gone over the accounts filed by the State's accountants in this case; if so, I will ask you if those accounts recognize these underlying principles which you have just referred to and are made in conformity therewith?

A. Yes, sir, they do. They have taken into account the use of the property by the different classes of traffic which passed over, and while I do not arrive at my results exactly by the same route that these gentlemen have taken I have, in the very short time which was at my disposal and the very limited amount of information which I had, roughly figured over the matter in this St. Louis Iron Mountain & Southern matter (which is shown on Exhibit "I-O")

and have roughly arrived at a result which adds $30,000 to the intrastate expenses as figured by the accountants of the state.

I will say that this amount, of course, might vary if I should work into the details of the account, but on this rough figuring basis I should say that I would increase their expenses not to exceed $30,000, intra, for freight business, I should say. On the passenger business it would be practically a parity with their figures.

Q. On the whole, that would be an inconsequential matter, in the matter of percentage in making the calculation?

3540 I should judge it would make a difference of about probably one per cent in the return which they have figured on the property. It might be less than that, but I should judge, just thinking it over, that it would make about that difference.

Q. As I understand you, you in your work along this line and the state's accountants here have followed the same principle:

You have worked yours on a different detail from which they have, but they would reach the same result, with that difference you have referred to?

A. Yes, sir.

Q. I want to take up some of this detail: take the first account there—in the first place, I will say that in the first division the accountants just took the railroad company division of freight and passenger on a train mile, accepted their division and commenced their work after that, and then divided between the local and through: take "freight trains" and take "Maintenance of way and structures"; and car miles—what use is made by railroad companies of car miles as a factor?

A. In apportioning the divisions of the maintenance of joint tracks, yards and terminals, and very frequently in apportioning the operation of joint yards and the operation of joint tracks, what is called the "wheelage" basis is used.

3541 They count the number of wheels. By that, I mean the number of cars, in and out of the station.

The reason that "Wheelage" was used is that it is one of the relics of old railroading, when they had four wheel dump cars against the eight wheel trucks; and we had some six wheel cars; so we got to counting "wheels" instead of cars. Now that is obsolete. We count cars but the old nomenclature of "wheelage" still hangs to the division.

Q. The car is the modern use of the same principle, is it?

A. Yes, sir.

Q. Is that an accepted basis among accounting officials of railroads for such work as this as it was used here?

A. Yes, sir, I should say, generally, that that is the basis upon which the joint maintenance is divided. There may be some exceptions to those, but that is the general principle.

Q. I am speaking of the general principle: did you mention leased tracks from one road to another as one of the places where this factor is used?

A. No, sir, only where the tracks are in joint use. The lease would be upon a track contract between the roads as to valuation,

and other matters, but where it is in joint use these expenses would be divided upon the wheelage basis.

Q. Now, Mr. Hillman, I wish you would take up this "Maintenance of equipment": that seems to be the proposition that
3542 our friends on the other side are criticising very much. I would be very glad to have you go through that with some detail.

A. On this "Maintenance of equipment" I find that the accountants for the state have first taken the expenses and divided them between yard, local trains and through trains.

This method of handling it altogether, with their percentages which they have added to each of these, is, to be a little trite, a "new one on me."

I had made the division of those accounts recognizing the switching but dividing the switching in the freight on the basis of the handling, counting it on the tons.

I had divided the rest of the expenses which are the road expenses, on the basis of the ton miles. I was anxious to see how that would pan out here and with the information I have, I ran that up. I find they charge on this basis to intra, in the neighborhood of $76,000 for those "maintenance of equipment" items, included in locomotives and car repairs.

In my basis it amounts to a trifle over $73,000.

Q. A difference of how much?

A. A difference of $3,000, or approximately 5%, between the two methods.

Q. Our accountants were——

A. Your accountants' figures were higher than those that I would have placed had I been making the division.

I was very anxious to see how this would come out, as it
3543 struck me that they had allowed very liberally for the extra expense incurred by the damage done by yard locomotives to the equipment in the switching process. They have made a further allowance for extra switching done by locomotives on local trains, amounting to 75%. This is quite heavy, and in my opinion, it is a very liberal allowance to this factor.

Q. It is in evidence here that they attempted to take the maximum on all of these allowances that are shown in this head, and I will ask you if in your judgment that is true, that they were high enough to be the maximum for these various items?

A. Yes, sir. I should say they are. I would further say that I have considered in the matter of allowing the switching, in my own division, upon the ton basis, that I was giving an allowance to the contentions of the railway Companies, and I have always felt in doing that that I wanted to place my figures beyond criticism and have therefore made that allowance on the ton basis. In doing so, of course, we ignore to a great extent the fact of switching of interstate tons at terminals, in making that division, but I think it is the best factor that we can get, unless we absolutely take the cars and their loading, which are switched at a terminal, and then apply that switching over the average length of haul, the ton mile basis,

which would be almost an impossible work to pick out after you have gone over an account. It could be kept at the time.

3544 Q. In other words, it would be reducing it to an exactitude that the effort would not justify?

A. I don't think it would justify it.

Q. Take this proposition on "Maintenance of Equipment":

I believe you say that you use the same principles in arriving at it, but you follow a different detail:

Is this a sound proposition, the way they followed it—not whether it is the soundest or best—but is it a good accounting proposition the way it is handled?

A. Yes, sir, it is.

Q. By "accountant" I am always referring to railroad accounting, Mr. Hillman.

A. I understand.

Q. I am not certain, but I believe you referred to that 50% extra switching of local engines: did you refer to that when you were referring to these others or not?

A. Yes, sir, I did. I referred to the allowance of 50% and I understood that that was a maximum allowance. The only factor that I have to check to see if that is proper or not would be taking the time of a local train covering the same distance as the time of a through train on the road.

I find, looking casually at it, on the Arkansas Division, that the average of the through train runs there is a trifle over eight hours on the schedule time.

That the length of the local run over the same division is

3545 10 hours and 15 minutes, which is practically an addition of 25% to the time of the through train.

Supposing, of course, that those trains as a general proposition make their schedule time, or their relative schedule time, it would be the proposition that the entire extra time consumed by switching along the line, which the local freight does and not the through, would be 25%.

Q. They have allowed 50%?

A. Yes, sir.

Q. You got those matters from the official time card of the Iron Mountain Road?

A. Yes, sir, from the official time card.

Q. That should represent the judgment of the man who arranged the time card as to what should be done, should it not, Mr. Hillman?

A. Yes, sir, and would represent to a certain extent what is done on the road, as a superintendent making up his time cards would not keep a time card in force wherein the train could not make its schedule. It requires too much work and entails too much expense, and you would naturally suppose that that had been the result of operating conditions as judged by the superintendent of that division.

Q. Now, I would like to call your attention to sub-division (C) there, under this "Maintenance of equipment, which is called "Supervision and General":

They are divided between local and through service on the
3546 basis of the direct charges for "Maintenance of equipment," and ask you what you think of that principle?

A. It is the correct principle. That is, that the superintendence in any block of accounts such as "Maintenance of way and structure"; "Maintenance of equipment"; "Traffic expenses"; "Transportation expenses", should be divided upon the basis of the other expenses which had been incurred in that division.

To this superintendence would be added such items as "Stationery and printing" and other expenses.

Under the block of "Transportation expenses" such items as superintendence; repairs of track tools and machinery; other maintenance of way and structure expense; stationery and printing; and injury to persons.

Under the block of accounts "Maintenance of way and structures"——

Q. I do not care so much about the detail of that.

A. They should be divided upon the basis of all the other accounts in that division which we have been able either to allocate directly to the account or divide between the different accounts on an approved——

Q. That is the principle which you have applied?

A. Yes, sir.

Q. I understand that these matters that you have enumerated are all there, so there is no difference in the detail?

A. No, sir.

3547 Q. I would like you to explain that. That is used here in all of these applications and is also used in the—I believe it is the fifth sub-division, the "General expenses"?

A. The same principle is applied to the block of accounts called "General expenses" for the reason that the duties of those officials and their assistants whose expenses are mentioned in that block of accounts, are to supervise and run the expenses which have been incurred up to that point, and therefore they are divided properly upon the expenses which have been brought from the other four blocks.

Q. Is that a recognized accounting proposition?

A. It is not, no, sir, generally recognized by railroad acountants. They still adhere to the arcade train mile basis.

Q. How is it in business and other enterprises?

A. That is understood in cost accounting that the overhead should be applied upon the basis of actual expenses incurred.

Q. Among what accountants is this principle usually and generally applied, Mr. Hillman?

A. The cost accountants, although there is a notable exception to what I mention, concerning railroads using it, which has just been filed in the Alabama case, or the L. & N. Railroad against the state of Alabama, where the principle of the division of these general accounts on the basis of the allocated or divided accounts has been applied in that case by Mr. Colson, the assistant comptroller of that system.

3548 Q. Then the railroads seem to be getting away from the prehistoric method of handling that?

A. (No answer).

Q. Now, take No. 3 "Traffic expenses":

You see there that these have been divided on a straight revenue basis although it is stated they are of the opinion that this unduly burdens the intrastate business:

I wish you would express your views as to a proper method of division of "Traffic expenses."

A. If I express my views, I would read exactly from this paper, which I happen to have before me.

Q. You mean the state's exhibit?

A. Yes, sir.

We have a set of expenses here for which we have no basis of division, unless a cost accounting method is introduced right into the traffic department and tab kept on the time that the men put in on interstate and intrastate work, and having no other basis for that, we are practically driven to the basis of dividing it upon the gross earnings.

I endeavored to get away from the gross earning basis where I can, but there is one case where I see nothing else but to use it, and certainly we are doing no injustice to the contention of the common carriers, the railroad companies, when we use that basis of division of the accounts.

Q. What are your reasons for making that statement, Mr. Hillman? Will you please explain the matter.

3549 A. A very large proportion of the intrastate business comes to the road without solicitation, or without being hunted for. The duties of the traffic department are to go out and obtain traffic for the Transportation department, to handle, and for the production of revenue.

In that, they go into competition with other lines, much more extensively in the interstate business than in the intrastate business for the reason that I have just stated that a very much larger percentage of intrastate business naturally falls to the road than does interstate business. For instance, in the case of outside agencies, they are maintained outside of the building which is attached to the track, you might say, and as a general thing, the roads have a large force even at points their lines don't reach; the roads maintain in all the eastern cities, large forces to obtain this traffic for them, and for that reason, I have stated that these expenses when divided upon the revenue basis, are unduly burdening the intrastate expense.

Q. Take the next item, four, transportation, the first item there is the station expenses; I will ask you what you think of the division that has been made there of the station expenses.

A. The station expenses as divided here, have been divided on the basis of two and one,—two to one, against the interstate; that is, the intrastate has been taken as two, and the interstate as one, re-percented and upon that basis, the division of station expense has been made. Where I have not had any other factor to go on, I

3550 have used this basis always, in dividing this expense.

Q. That uses the ton as a factor, I believe?

A. Yes, sir.

Q. Is that a proper factor there?

A. Yes, sir, that would be the proper factor for station expenses. I have at times gone into further detail upon this point, in order to determine how much of this expense was due to interstate and intrastate.

In one case, I went over the freight records, consisting of agents' abstracts principally, supplemented where necessary by the waybills, and made a calculation as to how many times——

Mr. MOORE: I object to the statement of the results of an investigation on another line of railroad; I understand Mr. Hillman is going to state now the results of an investigation upon another line of road.

The MASTER: I don't think it would be competent, except as a source of general information.

Mr. MOORE: I mean the result of it, that is what I object to.

Mr. HILL: Mr. Moore put into evidence at Chicago a lot of investigations made out in Iowa, Minnesota and other places, to re-inforce the judgment of his witnesses about the case.

3551 Mr. MOORE: I was taking the testimony of operating men, to show what their views were upon their experience.

Mr. HILL: They were making tests just like this gentleman was, to find out the truth about it.

The MASTER: Just keep within the lines of your experience and knowledge, what you have found out in those investigations is a matter of experience, and do not give the results.

A. I took the handlings of the less than carload lots, and upon the result of that investigation, I divided what is called our station labor, consisting of, as far as the freight portion of it goes, the freight handlers, for, as you may know, very little of the carload lots are handled by the employees of the railroad company. There was exceptions, of course, but those exceptions are not great and can be ignored, and I took these for the absolute number of times that the labor would have to handle this freight. I made the division on that basis for two of these roads, and from the result of those investigations, I would not——

Mr. MOORE: That is what I object to.

A. I am not going to tell the results, I don't know whether it is competent or not, that is what I am going to see; from the results of those investigations, I would not hesitate to indorse

3552 the method which has been followed here in the division of station expenses, with the statement which I have already made, that where I do not have that detail, I have followed that method myself in dividing the station expenses.

Q. That next item is yard and terminal expenses, divided between local and through business on the basis of the number of cars handled at terminals; are you familiar with that method and that factor of reaching that item of expense?

A. Yes, sir. I have not always gone into that detail. I am doing it now in one case that I have on hand, but I have not always gone into that detail where I have not had that factor; I have divided that, as I stated before, upon the ton basis.

Q. Which is the nearest factor, in your judgment?

A. The handling of cars at terminal stations, switching at stations, is undoubtedly the factor to be taken into consideration.

Q. When you cannot get that, you take the next best, as you have in some instances?

A. It really is not necessary to go into that much detail.

Q. The next item here is fuel and expenses; that matter was handled in this way, on the Iron Mountain; they took the fuel that was ascertained by a test made by the Cotton Belt Railroad, and the gentleman who had been general manager of both railroads,
3553 said that the fuel conditions should be practically the same upon those, and they have applied the factors obtained in the Cotton Belt test to the Iron Mountain in the absence of any data from which they could get the actual fuel consumption. What is your opinion of the proper way to divide that expense, or the way it has been divided?

A. The way that it has been divided seems to me to be proper. Of course, it depends to a certain extent, upon whether the conditions between the two roads were on an equality; if there is testimony to that effect on file, it should receive its confirmation, as far as that test only goes to confirm it.

Q. If you were confronted with a statement made by a witness introduced by the carriers, who had been general manager of both of the railroads in controversy, that that was a fact, would you feel justified in using his figures?

Question objection to and not pressed.

A. I would say further, that in the absence of the testimony of the character of which I have spoken, I have taken that consumption of fuel on the straight engine mile basis, as between the local and the through trains; I mean by that, when I have not that percentage available, I have taken it on the straight engine mile basis.

Q. The next item is engine house expenses, road; which are divided between local and through, on the basis of engine
3554 miles of each class of service, during a given month, where the test was made; there was an allowance, however, made of 12% more engine house service per engine mile on the local than the through, owing to the difference in the mileage; what would you say of that factor of dividing that item of expense?

A. Engine house expenses depend upon the engines using the facilities; necessarily, if the run, or presumably if the run of the local train was 12% shorter than the other, they would use that facility so much more than the other, and therefore, I would say that in the absence of absolute accounting of the engines using the facility that the factor which has been used here is correct.

Q. Loss and damage, that is an ascertainable quantity, and was

ascertained in this case, so there is no matter for discussion there; you recognize that as an ascertainable quantity?

A. Yes, sir, to use the phrase coined by Mr. Plant, comptroller of the Southern Railway, that is a question that is capable of allocation.

Q. That was allocated here. I want to call your attention to the exhibit, Division 7, this work has been done on a division between local and through expenses, and then the ton mile state and interstate taken care of on each respective train, and the division between state and interstate arrived at on that basis.

I will ask you your opinion of that, as to whether that is a sound method of ascertaining the state and interstate result, after
3555 working it out through the local and through train?

A. That is the method which is in vogue upon all roads, in determining this expense, and going upon the subdivision which the accountants for the state have done, I would say that if there is no discrimination in the handling of traffic upon the part of the railroad companies; that is the correct method; I mean by discrimination, it is a possible thing for all state business to be regulated as far as possible, to a local train, although it might be entitled by its length of haul, extending over an entire operating division, to a through movement, or the converse might be true, that interstate freight might be regulated to a local train; in other words, they might fill up their local trains with either inter or intra exclusively, to fill up the train to its capacity exclusively, when really it should be upon an apportioned basis, but that would require, to my mind, too much handling in examination, and I would therefore say, that I consider this method which is taken here, which shows the absolute facts which existed, and the method that it was handled, as sufficiently accurate for the determination of that matter.

Q. I will state as a matter of information, that witnesses both for the carriers and the State in this case, have testified that
3556 state and interstate freight has been carried indiscriminately, and handled indiscriminately, upon cars and upon trains; that is an established fact in this record, of the traffic conditions in Arkansas; there is no such thing as separation between state and interstate cars or state and interstate trains.

In view of that established fact then, what would you say of this division?

A. Considering that a fact, the method employed in Exhibit 7 is correct.

Q. There has been a great deal of testimony in this case, directed to an attack upon the ton mile basis of division of expense between state and interstate; I presume you are familiar with what is commonly called the ton mile or flat ton mile division of expenses between state and interstate, and I will ask if this division here, between local and through trains to reach the state and interstate, is subject to the objections that you are doubless familiar with, that have been urged against the flat ton mile as a division between state and interstate?

A. No, sir, I should say not, for the reason, that in this number

7, on these train expenses, these train expenses are incurred in making the train mile, and while the train mile is not a proper factor for a large part of the expenses, it certainly is the factor for these expenses, which consist of the train movement.

3557 Q. It is the proper factor to use at this particular division; the other factors have been taken care of before they reach this point?

A. Yes, sir, we have not used this ton mile in dividing all our expenses; the criticism on the ton mile basis is where we use that as the basis for all expenses, not for the expenses to which the ton mile properly applies; you could criticize the general use of a factor, and yet its use in a special case would be perfectly proper, while its use in a general case would not be.

Q. What do you say as to the general use of the revenue factor all the way through?

A. I have expressed my opinion on that subject.

Q. I wish you would turn to the passenger side of this exhibit, and without going into detail, just express generally what you think is the proper basis of dividing passenger expenses?

A. As a general proposition, all items on the passenger list—those that pertain directly to the train movement, are divisible upon the passenger mile; those which pertain to the station expenses,—I mean by that, the handling of those passengers before they get on the train, are divisible upon a passenger basis and not a passenger mile basis.

In making that passenger basis, we must also recognize the fact that there are two terminals on an intra passenger, and one

3558 terminal to the inter passengers.

We also should recognize the fact, that as a general proposition, an inter passenger requires more attention for his one service than does the intra for his one service.

I have therefore taken, almost invariably, the position taken here, as regards station expenses, that they accrued on intra passengers in passenger miles, intra passengers, t-o, and inter passengers at one.

Q. You used the passenger as a unit where you used the ton as a unit before?

A. Yes, sir. There is a slight exception to this, but the amount is so small that it can be considered a neglible quantity; that is there is a switching movement of passenger trains; that switching is for the train itself, not for the passenger, and when you have switched the train at a terminal, you have undergone an expense which prepares that train for its run over the entire mileage made by the train, and as such, that expense of switching should be divided upon the passenger mile basis, as preparing the train for that, there is a slight difference between that and the ton handling; if you will think of the inertness of the ton as against the activity of the passenger, you will see the reason why we leave the

3559 freight on the ton mile basis, and extend the passenger mile basis to cover the switching in the passenger business.

Q. I call your attention here to the division of the train between the coach, Pullman, mail, express and baggage, without going into

detail, you are familiar with the way that has been divided in this case?

A. Yes, sir.

Q. I will ask your opinion of that?

A. That is the refinement of the case that I have never gone into, but it is a basis which is correct, provided the information upon which the space in the cars which are used for joint mail, express and baggage is correct, the basis taken here is a correct basis for setting up those expenses.

Q. As I recall the testimony, information was obtained from the contracts with the express company and the contracts with the Government for the mail, as to the space allotted to each; of course, you know nothing of that, and have to assume that is correct information.

A. I want to add here, that I have never in my handling of these questions, set up mail and express cost. I have proceeded on a different method which gives, however, practically the same result, if you will think of it for a moment; and that is, I have taken the earnings which accrued from these various operations of the
3560 passenger department, and allowed the through expenses to remain in with the other passenger expenses, but apportioned the earnings upon the basis of the passenger expenses already determined. That amounts to the same thing as we have here.

Q. As a principle of accounting, what would you say of the division that has been worked out here?

A. As a principle of accounting, the divisions that have been worked out here, have been worked out on a basis that is fair and reasonable.

Cross-examination.

By Mr. MOORE:

Q. What do you mean by determining these questions on principles of accounting?

A. That would mean the correctness of applying the factors of use which we have added to the expenses.

Q. Isn't that a matter though, that depends in the first instance, upon the manner in which the business is conducted, and the uses that is made of the various instruments that are engaged in the transportation of freight as well as passengers, rather than upon the method of accounting, isn't that the underlying thing?

A. Certainly, and only as accounting is based upon those underlying principles, is it correct as an accounting proposition.

Q. In other words, an accountant, in order that the
3561 methods he adopts may reflect the result correctly, say in this case, the divisions to be made, he must first get the business on that basis, and that basis must be the actual operations of various accounts involved in the handling of traffic, and when I say that, I am including instruments of transportation, cars, and equipment, that is correct, isn't it?

A. Yes, sir, he must apply to his basis of accounting, the factors of use; otherwise, it is not a correct proposition.

Q. In other words, the system and method of accounting is simply the application of the facts, so to speak, which characterize the service, and the different varieties of service, in the division of the expenses or the earnings, as the case may be?

A. Yes, sir, it is the proper recording of those factors which you have mentioned.

Q. What is included under the division of passenger expenses in the exhibits to which your attention has been called, what is included under the third item there, traffic expenses, what character of expenses is included in that?

A. The expense of the superintendence of traffic, the outside agencies, the traffic associations, and the necessary stationery, printing and so on, that go with those.

Q. Now, what connection has that service, and what benefit
3562 accrues from that service to the mails carried on the trains?

A. The traffic manager, in all probability, would be called into consultation as to the making of those contracts with the Government, and as to the usual triennial checking of the amount of mail carried over the road; he would have something to do with that.

Q. Are not the terms of those contracts prescribed by the Government, and are not modifications in them governed by certain rules prescribed by the Government?

A. Yes, sir, but nevertheless, he would have something to do with that; at each checking and at each contract letting, they are the subject of more or less correspondence and controversy between railroad officials and the Government, or sometimes they are the subject of competition between different roads, to obtain the contract from the Government, and there the traffic manager would have something to do with it.

Q. The great bulk of that traffic expense is advertising and travelling and getting up matters of that kind, isn't it? I say, the great bulk of traffic expense, is in travelling, advertising, and matters of that sort, and in maintaining agencies in other states?

A. Yes, sir, in obtaining traffic.

Q. The consultations which you say the traffic officials may be called into, would be a very small proportion of the expense, wouldn't it?

3563 A. Yes, sir, it probably would not require as extensive an outlay of time on the part of the traffic manager as the other business would; either in proportion to the return which he would get on it, and it would have very little to do—about the same to do, with the clerical effort of his force.

Q. When they have a regular traffic organization on a railroad, aren't those consultations and correspondence handled rather with the operating officials, the manager of the road and the executive officials?

A. It is very hard to draw the line where the general manager and the traffic manager's duties end and commence; the traffic manager would not be justified in making a contract with the Government of mail, or with an express company for express, without consultation with his general manager; there is no question about that.

On the other hand, the general manager would not be justified in taking the matter in his own hands, without consultation of his traffic men.

Mr. HILL: I think your question assumes a fact that is not in evidence here; I understand their mail department is under general expenses.

Mr. MOORE:

Q. Isn't that service, making contracts, and the matters you mentioned in your last answer, in charge of the mail agent who
3564 represents the railroad company in making all contracts with the Government?

A. That is possible, that might be done.

Q. Isn't that expense carried in another branch of the service?

A. I should think not.

Q. Is that included in traffic expenses?

A. Yes, sir.

Q. You base your impression you have given here, upon the assumption that that is charged in the traffic expenses, and not in other accounts?

A. I believe, since you speak of it, the superintendent of mail is under the general officers.

Q. That being the case, what do you think about the propriety of charging part of that to mail?

A. How is that?

Q. Charging part of that expense to mail, charging 11.63% of the traffic expense to mail?

A. I don't see any particular objection to it, excepting that as I stated, in that amount there might be some difference in the amount of work which that man did under the mail contracts.

Q. You say there might be, but assuming now, and taking it from the standpoint of the orderly methodical conduct of the business of a railroad, and the division of the duties among the different departments and different officials, what would you say about it?

3565 A. In that matter, the division of those expenses, it is possible that there may be too much percentage charged in there, in that special case, to the mail department, of the traffic expense, but if it leaves the traffic expense here, it will go under the item on the next page of supervision in general, upon which the percentage is 10.95 as against 11.63 here, a difference of seven tenths of one per cent, in whatever amount you would transfer from one to the other; I should think it would be a matter that would be inappreciable and negligible, as there are really some duties in connection with the mail that are correctly charged to the traffic department.

Q. Assuming that all matters in connection with the mail is under a separate department, the mail department, that the expense of that department is charged to general expense, would you say it was proper under those conditions, to charge any part of the traffic expense to the mail?

A. No, sir, not under that supposition.

Q. What service is rendered by the agents of the Company in the traffic department to the superintendence of the business?

A. That comes under the traffic official to a greater extent than does the mail.

Q. What service is rendered by traffic officials in connection with the handling of express matter on the railroad, assuming that
3566 the expense business of the railroad is conducted by an entirely different and distinct corporation and is not under the control and is not conducted by the railroad company?

A. There are questions constantly arising between the express company and railroad company, which are referred to the traffic officer for adjustment. As those matters come up, they are taken and decided and adjusted by him.

Q. What do you mean by the traffic officer.

A. I mean the man, say like J. M. Haniford, 4th Vice-President of the Northern Pacific.

Q. Is his salary and expenses included in this item of traffic expenses?

A. A certain proportion would be.

Q. You assume that to be the case, but assume that the officers' salary is charged to general expenses.

A. Then it should be charged to general expenses.

Q. And should not in that case be charged to traffic expense?

A. Only if the supervision of that matter is removed entirely from the traffic department, and removed to the general department, then there should be no charge here.

Q. Suppose your assumption made a moment ago, that the traffic manager would have occasion to adjust some difficulty between the express company and railroad company, suppose that traffic
3567 manager is charged against general expenses, should that charge then go into traffic expenses?

A. Not if the officials should have absolute charge of that matter; if it is all charged under general expense, there is no question that the traffic expense should not be put in here at all; there is no question of that.

Q. That being a fact, the assumption you made a moment ago, the basis of what I have stated, that that business is conducted, but the expense that there may be goes under the head of general expenses, should not this expense be divided in the same manner that you did the direct traffic expenses on the gross earnings of the business, as you stated awhile ago? together with the passenger business in this department of service?

A. Yes, sir.

Q. Now, there is 19.33 per cent of the traffic expense charged on this exhibit to mail and express; if that view is correct, that would be an improper charge to that account, would it not?

A. That would be an improper charge to mail and express, and what has been charged there would necessarily be divided between interstate and intrastate.

Q. In the same way that you divided the freight?

A. In the same way as it is divided in the first two lines of that station which you are quoting.

3568 Q. What service accrues to mail, which would justify the charge made on this Exhibit of 12.82% of supervision and general expenses to mail?

A. The repairs of the mail cars, the repairs of the locomotives, necessitated by the proportionate weight of the mail cars on the train, would necessarily be included in this supervision in general, and reflected in that, the same as they are in locomotive car repairs and train car repairs.

Q. What other expenses are included in that account, supervision in general, if any?

A. Superintendents, shop tools and machinery, stationery, printing, injuries to persons, and what we used to call other general shop expenses, and other maintenance of equipment expenses would be included in that supervision in general.

Q. Take the Pullman cars, what service which should be charged to supervision in general, is rendered to Pullman cars?

A. That is the supervision rendered necessary by the superintendence of the maintenance of the motive power, the engines, on which repairs were necessitated by the pulling of the proportionate weight of the Pullmans in the train.

Q. Do you feel that 13.88% of the total amount charged would be a proper charge.

A. Yes, sir. If you will note on division A of that same #2, the prior page, page 1, you will note that the $35,000. is the

3569 Pullman mileage proportion of the expense to engines. No Pullman car repairs have been charged by the accountants on this basis; it is simply a question of figuring the percentages from the figures here.

Afternoon Session.

Q. You were talking about the division of general expenses under the head of maintenance of way and structures when we adjourned at noon; as I understand the basis of the division of this expense is the direct charge contained under the head of maintenance of equipment, under the head of locomotives, that is correct, isn't it?

A. No, sir, I understand your question to say, general account of maintenance of way and structures, did you not?

Q. No, sir, I was talking about maintenance of way and equipment, this item of supervision in general; it states it is on the basis of the direct charges as apportioned, and that is under A locomotives, isn't it? I think you explained that to be the case this morning.

A. It includes all the accounts in that division, maintenance of locomotives, passenger train cars and everything else.

Q. Going back to the basic matters, I will ask you if you

3570 think it is proper that a charge of this character of expense should be made to the Pullman, when the railroad does not in fact maintain the Pullman cars?

A. This is supervision in general; this is for the reason that that Pullman expense, if you notice it is marked there in direct charges,

that is the expense of the repairs to the engines, the motive power, which is caused by the strain of pulling the Pullmans.

Q. Does it cost as much per car per mile to maintain Pullmans as it does mail, express or passenger cars?

A. No, sir.

Q. If that is so, is it proper to divide that on that basis, because it is divided on the basis of the car mileage arranged there?

A. Yes, sir, you will note there are two divisions, the first is locomotives divided in Pullmans, coach, mail and express.

Q. I am speaking of cost of maintenance of locomotives, if it doesn't cost as much to maintain the Pullman, and if the Pullman doesn't run in a great many trains, and if the express cars do not run in a good many trains, and the mail cars do not run in a good many trains, if it is proper to charge them up on an equality,—I mean in the locomotive expense, on the basis of the car mile.

A. Yes, sir, because locomotive expense here, is divided, if you will note, upon the basis of the mileage made by the cars, and, of course, that would include the differences in the mileage made by the respective equipment, coaches, Pullmans, mail and ex-
3571 press. When I said that it did not cost as much to maintain a Pullman as the other equipment, I referred to the fact that the Pullman charge only accrues in locomotive repairs, and does not accrue upon the passenger train cars.

Q. After you have ascertained the percentage of the maintenance of locomotives that is chargeable to Pullmans on a car mile basis, assuming for the time that that is correct, then you divide the expense of supervision in general on the basis of the charge on the locomotives per locomotive, these direct charges, locomotives and passenger train cars?

A. Yes, sir.

Q. The Pullman is not included in passenger train cars, therefore, it is on the basis of locomotive expenses, isn't it?

A. It isn't on the basis of locomotive expenses, but it is on a basis which includes both maintenance of the locomotives and maintenance of the train cars, and as it only enters into one of those expenses, it is upon the expense which accrued under locomotives only.

Q. That is what I meant to call your attention to; I will repeat the question I asked you awhile ago; the railroad company does not maintain that class of cars, why should you enter a charge here against the Pullman car, under the head of supervision in general, why should you base a charge there against that class of cars?

A. We base a charge against supervision on account of that class of cars, for this reason——

3572 Q. Wait a minute, let me explain what I want to call your attention to. I understand that you assume that the expense of maintenance of locomotives is divided between the different classes of cars under sub-division "A", I understand that, and you state that is properly done because the damage is inflicted in part by the Pullman to the extent that car is used on the track. What I call your attention to is this; assuming, that is correct and that that is a proper direct charge, what I want to know is, is it proper that you

should make the fact that it is subject to that direct charge under subdivision "A", on account of the locomotive maintenance, is that fact any reason why you should charge an equal amount, that is an amount of expense proportionate to the mileage of the Pullman car, under the head of supervision in general, when there is practically no service to amount to anything, rendered under that heading to a Pullman car?

A. If you will notice, we do not do that; if you will take "A" under this division, maintenance of equipment, you will notice that the amount charged under that percentage to coaches is $94,500.26; if you will now turn right over to "B", the passenger train cars, you will see that the amount charged there to coaches on the percentage, and Pullman is omitted from that $62,711.39; the same is true of the $94,500.26, and that and the $62,711.39 make up the amount of $157,211.65 shown in the first line under the heading, direct charges, in division "C", supervision and general. If you
3573 will then refer again to maintenance of equipment, division "A" locomotives, you will see that the Pullman is there charged for its proportion of the repairs of the locomotive, with $35,206.63. It is charged with nothing in Division "B"; the total with which it is charged under direct charges in "C" line 2, is $35,206.63. If you will then, in the same way, refer to the mail cars, you will see that under Division "A", they are charged with $19,559.24; in division "B" they are charged with $12,969.06; in division "C" they are charged with the sum of these two, $32,528.30. The same way with express cars, under division "A", $17,195.48. Under Division "B", $11,418.70; under Division "C", the sum of the above, $28,614.18, these accounts, coach, Pullman, mail and express coaches have two items charged against them in Division "B", the Pullman having but one item charged against it in Division "B"; mail having two items charged in Division "B", and express charged it in Division "B", they are then added together, and the percentage which these charges show to coach, Pullman, mail and express are percented, and the expense is charged for the supervision and general expenses on the basis of those percentages, which is correct.

Q. I understand all of that perfectly, and I know that you have added the expenses of "A" and "B" together, so far as the coaches are concerned, and you have charged the per cent, the percent of Pullman expenses under Sub-division "A" was 21.15 of the total, and the percentage under Division "C" arrived at in the way
3574 you have described is 13.88; an explanation you have made accounts for that difference in percentage; I understand that; assuming that to be true, I repeat the question, in view of the fact that there is practically no service of the kind that is included in the expenses, supervision in general, applicable to Pullman cars, is it proper to charge that percentage of the total maintenance as shown by Sub-divisions "A" and "B" to Pullman cars?

A. Yes, sir.

Q. Explain to me what service it is that justifies that?

A. As I have said, the superintendence, and speaking of the superintendence, I mean the supervision of these general accounts, they

find it necessary that they look over and direct all of the operations and the conduct of this block of accounts, maintenance of equipment. In this block of accounts, we find that there is a percentage of those repairs which they supervise, which is due to the fact that Pullman cars are pulled upon the train; it applies only to the locomotives, the Pullman Company taking care of car repairs save certain little odds and ends. Therefore, in the supervision of his locomotives, this superintendence is necessarily devoted to these locomotives and a certain proportion of his time, of which 56% accrued upon the coach time, because of the coaches pulled by locomotives; 21.15% upon Pullmans, because the Pullmans were pulled by the
3575 locomotives to that extent, 11.75% on the mail, because the mail cars and cars carrying mail were pulled upon that percentage, and 10/23 to the express, because the express cars were pulled upon that basis. Therefore, of the time that he spent in supervising the locomotive business, 21.15% was chargeable to the Pullman service.

Q. You are overlooking the fact when you go to apply that to supervision in general expense, that there are a great many other kinds of service in the auditing department rendered to the coaches and even to mail and express, that are not to the Pullman, are you not?

A. In what department is that you say?

Q. Expense under the head of supervision in general; the only expense I could conceive of that would accrue against the Pullman car is that which would occur in the auditor's office, excluding locomotive supplies and expenses; what is the character of service rendered to the Pullman car under sub-division "C"?

A. It is the percentage of the locomotives. I think you mistake in that matter, that this supervision and general is only the supervision and general items under the head of the block of maintenance of equipment; it is not general expense which accrues in general expenses and the expense of the auditor's office; that accrues at the end of the accounts, further on.

Q. I will ask you what the general expense under sub-division 5 to Exhibit M represents?

A. Under maintenance of way and structures, you will note
3576 that the Pullman——

Q. I asked you under sub-division 5 of Exhibit M, general expenses.

A. That is the proportion of the general expenses which have been incurred on account of the pulling of Pullman cars; if you will note under #1, on page 1, that there is $106,021.02 incurred on account of Pullmans. Under #2, maintenance of equipment, division "A"——

Q. That is direct expense that is made the basis of it?

A. Yes, sir.

Q. You do not understand my question, I understand that; I asked you, what does general expense under that heading include; what is the meaning of that as used there?

A. As used in division 5?

Q. Yes, sir.

A. The expense of the general officers and their clerks, and what they call other general expenses, which are included in that block of accounts.

Q. On the basis of direct charges to other classes of expenses, 18% of general expense is charged on this sheet to Pullman cars, what, in your opinion, will justify that charge of 18% to Pullman cars?

A. It is justified by the fact that in charging directly to the expense which had preceded this block of accounts which is headed general expenses, that there have been $273,188.56 of expenses which has been shown to have been charged to this expense on
3577 account of the Pullman cars being hauled over the line.

Q. That is the way you have ascertained the ratio is it not,—what the percent is?

A. Yes, sir.

Q. What justification is there for charging any part of the item of general expenses there to the Pullman cars?

A. For the reason that the expenses have been incurred by the operation of the Pullman cars on the line.

Q. The particular character of services represented by this item is services in the general office, isn't it?

A. Yes, sir.

Q. What have the general offices of a railroad to do with the Pullman car?

A. They have to do, not with the Pullman car perhaps, but with the expenses which are caused by the Pullman car, as I quoted in maintenance of way and structures on page 1, there was $106,021.02 of the expense incurred on account of the hauling of Pullman cars over the line. Therefore, to that extent, whatever supervision was given by the officers in block 5, general expenses for maintenance of equipment, 21.15% of that was charged to Pullman service in the same way, under maintenance of equipment——

Q. I think that illustrates what you mean. The question I am trying to ascertain is, if the services rendered under these various headings, and part of it which pertains to Pullman cars, in
3578 view of the fact that the Pullman car is charged with 21.15% of the maintenance of way and structures, it pays there for its charge of the injury that may be allotted to maintenance of way and structures; the same is true of maintenance of equipment; it is charged with 21.15% of the expense of locomotives, and so on; that illustrates it without tracing it through; it pays its own way along through; it is not that expense you are talking about now, we are talking about expense of the general offices. Now, there is no expense of the general offices incident to Pullman cars except may be the time of one clerk to keep the accounts in the auditor's office, and that would be a very small portion of his time; assuming that fact, is it justifiable to charge 18% of the general expense to that account?

A. Yes, sir, for the reason, that when a Pullman has paid its share or there has been a charge to the Pullman of its share of the maintenance of equipment expenses and maintenance of way and structures, conducting transportation and so on, it has not then paid all

the expense which has accrued by reason of its use; there is still the general expense, which is coming on another account, of which it has not paid its proportion, and therefore, as these charges were made against it, it was simply paying under block 5 its proportion of general expenses which were incurred by reason of its use in prior accounts.

3579 Q. If I understand correctly, you stated in your examination in chief, speaking of the apportionment of expenses of switching as against the movement of through trains, you said that expense was in regard rather to the trains and not the passengers; please explain that to me; my recollection is a little indistinct as to that.

A. I meant by that, that when a passenger train is made up at a terminal station, it is switched at that time. It has on it just so many passengers starting out from a terminal, but the switching which it gets at the terminal lasts during its entire run, or to the next terminal, the end of its run, therefore, that expense which prepared for every passenger that gets on, should be on the basis of passenger miles, and not on the basis of passengers who happened to be on the train at the terminal when it is switched, and therefore, is an expense which is a train expense and not a terminal expense, although it is incurred at the terminal.

Q. What is the difference between that character of switching service to a passenger train and the switching of freight cars?

A. For the reason that the freight train car switching, lasts, you can say, for the life of the car only; the freight has to be put out; it has to be absolutely handled itself; the passenger handles himself after his train is once fixed for him, and in that respect, the ton basis, the number of tons handled, would be the factor for

3580 the switching charges, and not the ton mile basis; if the passenger were inert, and compelled to be handled as a freight car is,—that is, if it was necessary to switch your passengers when you take them off and on, it would then be necessary to take them on the passenger basis and not the passenger mile basis.

Q. Doesn't the handling of the freight though, doesn't that enter into the station service rather than the switching service?

A. The handlings, yes, sir, enter into the station service; I am speaking simply of the switching in that regard, and not the station service; we handle our passengers upon the basis—we handle that expense I mean—upon the basis of passengers and not in passenger miles.

Q. That is terminal expense you speak of?

A. Yes, sir, as when a ticket is sold, it is sold without reference to the fact whether it is a five mile run or a fifty mile run.

Q. You divide the terminal expense with regard to freight the same way?

A. The station terminal expense, yes, sir.

Q. If you adopted the same method in regard to station expenses, and in regard to passenger train and station expenses which are analogous, why not adopt the same handling or same method in regard

to switching service which is similar; you do not handle and
3581 do not render station service, switching service, to the contents of a freight car any more than you do to the contents of a passenger car; it is switching service I am talking about; you do not handle the contents in a freight car any more than you do the passengers in a passenger car?

A. Yes, sir, for the reason that as soon as it is necessary for that ton of freight to leave the train, that carload of freight, it doesn't handle itself as the passenger does, it has to be handled by the appliances of the road.

Q. Isn't that charge under another heading than switching expenses, the handling of the carload or car?

A. No, it is under the switching expenses; it is switching expenses of which I am speaking now, that when you get a freight car out, you have got to handle it; when you get the freight out, you have got to handle it with the road's appliances, making it rather a ton matter than a ton mile matter, while the passenger, as far as switching goes, his train is ready for him and he handles himself. I would be very much pleased to have it, for this contention, on this ton mile basis, as it would accrue a little to our advantage.

Q. Taking up, under Exhibit "M," under sub-division "B" of maintenance of equipment, the state's accountants have divided the
expense of passenger train cars as between coaches, mail cars
3582 and express cars, on the car mile basis; I want to call your attention to the difference of the use and the service on this; the coaches are loaded with passengers, the mail and express cars are loaded and used in a different way, do you think that it is proper to divide that expense as between those cars, in view of that to which I call your attention, on a car mile basis, thereby attributing the same character and amount of use in every way, to mail and express cars, that you do the coach?

A. That percentage existing there, should be taken upon the allocations of the repairs of the different classes of cars used in passenger service; if the amount of annual repairs per mail car is only 75% of the annual repair to a passenger coach, the mileage of the mail car should be reduced to that percentage of coach miles; that is a matter that is subject to the creation of the absolute allocations of repairs to the different classes of cars.

Q. Has that plan been followed in the division of that class of expense in the exhibit before you?

A. No, sir, that has not been done; in there, there is an assumption of the parity of annual repairs to both coach, mail and express.

Q. Going to station passenger expenses, which you will find under sub-division "A," under transportation expenses?

A. Yes, sir.

3583 Q. The expense is divided in the formula filed by the state's accountants, between intrastate and interstate business, on the basis of the number of passengers of each class handled, assuming that each passenger intrastate makes two uses of terminals, and an interstate passenger makes use of one terminal; that leaves out of the question, doesn't it, the fact that trans-state passengers

who should happen to be on these trains, are not handled at all at terminals in that state?

A. They may or may not be, depending upon the method.

Q. Assuming that they are not, then would that be a proper division of the expense?

A. No, sir, it would not, considered directly in that way. As I stated before, I think I stated it in my direct testimony, I have adopted this method of division myself, of station expenses, intra two and inter one, ignoring what we might call the bridge work of interstate passengers, considering that it was fully off-set by the extra amount of labor entailed when an interstate passenger did receive attention at a terminal.

Q. What additional attention do you have in mind when you speak of additional attention to interstate passengers at terminals.

A. The bulk of the intrastate passengers are served with tickets which are called by various names, general, simplex tickets; they are readily handled, require little time, the rates are well
3584 in the agent's head, and known; an interstate passenger is more, to a greater extent, served with a coupon ticket, in which it is necessary to write in the name or to punch the name of the station from and to; it has to be stamped and the limit punched on the ticket. This requires considerable time; the fact is, that with the card tickets or simplex tickets, probably ten passengers could be served and gotten out of the way, while one coupon ticket passenger is served.

Q. Isn't that rather an extreme assumption?

A. There is some assumption to that; I will admit that I am quoting the extreme of the cases, because there are certain tickets which are interstate, which are handled on the line of the road, which are just as familiar to the agent and just as easily handled as the other; on the other hand, there are some interline intra-state passengers which require just as much attention as an interstate coupon ticket passenger, but the percentage of coupon tickets interstate is very much larger than the per cent of coupon tickets intrastate, and for that reason, I have assumed that the bridge work would be thoroughly off-set and more than off-set, in my opinion, by this extra percentage on coupon tickets.

Q. You assume then that the extra service you speak of,
3585 will be equivalent to the terminal service of the interstate passenger, in the case of the trans-state passenger?

A. Yes, sir.

Q. I believe you stated this morning, you used tons as a basis of dividing yard expenses between state and interstate; would it not be better to use that unit there, than to make the division between local and through trains on the car mile basis, and then divide between state and interstate on the ton mile basis, wouldn't it be a more direct way of arriving at the result?

A. I would not like to say that it would be the better way of doing it; it is a method I have pursued heretofore myself, in handling those expenses.

Q. I take it you pursued the method you thought the best?

A. I pursued it because my attention had not been called to this method of handling; I think I stated when I went over it, that it was a new one to me, that it received attention from me as to how it bears out, and it looks very fair on the face of it.

Q. Assuming if your plan is the proper plan, wouldn't it be better to divide the car expenses, I mean the expenses on the basis of the cars, between state and interstate, rather than to divide it between local and through trains, and then on the basis of ton miles between state and interstate, as far as it could be done?

3586 A. I think that the absolute car basis of the handling of the cars would be the best, and if my recollection serves me, that is the way the accountants for the state have taken it up.

Q. If you will turn to page 4 of Exhibit K, you will find that the yard and terminal expense is divided between local and through business on the basis of the number of cars handled at terminals, that assumes, as I understand it, a division between local and through trains, that is the way it is divided between local and through trains; after that is done, then this expense is divided between state and interstate business on the ton mile basis. Now, what I want to ask you is, what is the use—is there any good reason for dividing that expense between state and interstate business upon a ton mile basis, where it is practicable, in so far as it is practical to divide it on the basis of the cars in which the freight is handled?

A. Offhand, without, as I have stated, going into this matter further, as I wish to do, I should say that I would prefer to accrue the switching cost upon the cars at the terminal, and after that amount of money had been determined, I would then, of course, distribute it by the ton mile basis to state and interstate, as that would be the factor, or you might say, not the factor, but the term in which I would express costs. I would not base the costs

3587 on the ton mile, but after I had the cost of this ton and all other expenses, I would then express that in a cost per ton mile.

Q. You would make your division on the car basis?

A. Yes, sir, I think I would, as I see it now, without going further and comparing it further, I think I should fasten it on the car or ton.

Q. The state's accountants, in the exhibits in this case, have divided a large part of the train expenses—of the expenses, I mean of trains—on the car mile basis, and in doing that, the car is a car without regard to its contents, whether it is empty or loaded; if it is loaded, without regard to the weight of the load. Now, what is your view as to the proper method of dividing that character of expense between freight and passenger cars?

A. That is, the expense of switching?

Q. Yes, the maintenance of way and structures and equipment, all that sort of thing, I am speaking now of these large divisions, maintenance of way and structures, maintenance of equipment, and that character of expense which is divided on a car mile basis as between local and through trains; what in your judgment, would be

the better way of dividing that between passenger and freight—I speak of the car itself?

A. The car mile or the car basis, and terminal car basis, as set up here, and dividing it by the ton mile would not enter into the division between freight and passenger.

3588 Q. You do not understand me; I say, after the freight and passenger expense has been divided, then the expense we will say of freight traffic is divided first between local and through trains and that division is made, or the larger divisions made by the basis of car mileage, made by each train; what I want to ask you is, why should not that unit be used as a basis of dividing between passenger and freight, as well as between the two kinds of freight trains?

A. The car miles?

Q. Yes?

A. I would not use the car mileage in the division between freight and passenger, I would use train weights for maintenance of way and structures, the maintenance of equipment is allocated, passenger equipment and freight equipment.

Q. The expense between passenger and freight in these exhibits filed by the state, is divided on the train mile, isn't it?

A. I don't know, sir.

Q. That is the train mile made by each class of train?

A. That is whatever the loads had done, I don't follow that.

Q. Which would you regard as the better method of division?

A. Which two, do you mean?

A. The train mileage or car mileage?

A. Neither of them.

Q. Give me your views upon that subject?

3589 A. My views on that subject would be that the expense of maintenance of way and structures should be divided upon the basis of the train weights in lieu of train mileage.

Q. Explain to me what you mean by train weights?

A. I mean that a passenger train will weigh approximately 250 tons, and a freight train will weigh approximately 900 tons, engine and tender included. The division should be made upon a gross ton mile basis.

Q. You would adopt that instead of the train mile basis?

A. Yes, sir.

Q. When you say trains, you speak of the weight without regard to the contents, do you?

A. No, sir, I mean the weight of the engine and the tender, and the weight of each car, what you call light weight of each car, that is the weight of the car without any load on it, and to that, I add the number of tons which are loaded on those cars, so it would be the weight of the motive power, the weight of the rolling stock and the weight of the live load and also the weight of the caboose.

Q. That is freight?

A. Yes, sir.

Q. On the passenger, you adopt the same method?

A. Yes, sir, the weight of the engine and tender, the weight of

the equipment, the rolling stock, the average passenger miles, taken at the basis of 150 lbs. each, an allowance for 50 lbs. of baggage per person, and the express, varying according to the amount
3590 of express which the road carries, light or heavy; mail the same way, the load of your cars.

Q. What would you think of the propriety of applying that method of division as between trains and cars, local and through trains?

A. It would be practicable to do it, equally as well as it would in dividing between passenger and freight; that weight basis only concerns the wearing out of your track. I probably should state further, with regard to that, that the switching must be included in any computation which may concern the work of maintenance of way and structures; the switching work must be included; I would say that between the local and the through trains that should be—the weights should be taken into question, in so far as they applied; we can only apply that partially, owing to the fact that there is extra switching down along the line by those local trains; taking that into consideration, as has been done in this case, the weight basis could apply.

Q. Your method of division as between freight and passenger, according to the weight of the trains, applies to total expenses?

A. Only the maintenance of way and structures.

Q. The total maintenance of way and structures expense, doesn't that include switching in that division?

A. It includes the weight of the switching movement, yes sir.

3591 Q. If it would be proper to make a division on that basis, including the switching as between freight and passenger, wouldn't it be equally proper in dividing between through and local freight trains?

A. Yes, sir.

Q. You could use the weight basis without any trouble, and so you attach some importan[illegible]o the weight as one of the factors in determining the relative expense; what do you think of a division that totally disregards the weight and puts an empty car on the same basis as a car that weighs 48 tons.

A. It depends on what expense you are treating.

Q. Take first, maintenance of way and structures?

A. I consider that it should be upon the basis of the weights.

Q. What effect would that have with regard to maintenance of equipment?

A. Nothing practically.

Q. You say freight cars is included in maintenance of equipment,—the repairs to freight cars?

A. Yes, sir.

Q. Is that not affected by the loads those cars carry?

A. No, sir, not to an appreciable extent; the cars are liable to injury from movement when empty as well as when loaded.

Q. Are there any other items of expenses besides maintenance of way and structures, in which you would take into account, the

weight of the contents of the cars, speaking of freight cars now?

3592 A. No, sir, none where I would use that factor; there are certain expenses, such as the fuel, locomotives, and so on, that depends to a certain extent upon the weight which is back of the locomotive, but I would not use that weight as the factor for determining that, because there are other methods by which that can be determined.

Q. What are the other methods?

A. The direct allocation of the fuel to engine pulling the train, which is what we call individual engine performance sheets, kept on almost all roads.

Q. When did you undertake the service that you mentioned in your examination in chief, for the Louisville & Nashville Railroad, in its litigation?

A. I first commenced an investigation of the Louisville & Nashville for the State of Kentucky, three years ago, today, I think it is, or at least three years ago this month. The service has been, however, intermittent; since I have been examining for Kentucky, I have worked for Florida, and then for Alabama, and they are under examination for Alabama again the second time——

Mr. HILL: You asked the question, Mr. Moore, when he undertook the examination for the L. & N.; I think he stated that he examined the road for the Commission of Kentucky.

Mr. MOORE:

Q. I think you stated that you were employed by the
3593 Commission?

A. Yes, sir.

Mr. HILL: Your question implied that he had been employed by the Louisville & Nashville Road.

Mr. MOORE: I didn't mean that.

Q. I observe that you suggest the expense as a basis of division, I want to ask you,—I mean as a unit of dividing between the two classes of business, if expense is not a fluctuating quantity itself, with the rise and fall of the cost of labor and material?

A. Yes, sir.

Q. And it is not by any means a stable factor?

A. No, sir, the expenses vary from year to year, and it is also my claim, that the use of the property varies as the expenses which are put upon it.

Q. For instance, you take the expenses today, of operating a railroad, compared with what it was a few years ago, and it would make a great difference in the expense of conducting the same kind of business, in the same manner, would it not, growing out of the difference in the prices of material and labor?

A. Yes, sir, the expenses would be higher, and you must recall at the same time, that advancing step by step with all the expenses,

the traffic has increased, they have advanced together, and
3594 that, therefore, the expenses would advance step by step, and the relation or percentage between these two expenses, would hold stable whether the prices were low or high.

Q. In drawing a comparison between the fluctuating quantity of the earnings and of the expenses, you assume that the rates are more variable than the cost of service and expenses?

A. No, sir, the rates have nothing to do with the use of the property.

Q. Take the revenue then, is the revenue more variable than the expenses?

A. It is not a question of variation at all, it is a question of the proper factor to apply.

Q. The statement has been made here that one objection—I don't think you made it—that there was one objection to the revenue as a unit of division, and the objection is that the rates fluctuate, and that the revenues are therefore not stable; now, what I want to ask you is, what is the degree of variation, if any, between fluctuations in revenues and in expenses of conducting the business; do you find there is any very great difference?

A. There is a difference, of course, in the expense; that is, the expenses would rise with increases in the price of labor and material, while you might not be able to, at the same time, increase
3595 the rates, your traffic figures, but the question of the variation is not a variation from time to time in the amounts, but the inequalities which exist in the rates for the same class of service.

3596 Q. You do not think, then, that the fluctuation in revenue produced by changes in rates, is one of the foundations of your objection to that basis of division, do you?

A. Oh, no, sir. It is only an indicative factor on the general supposition that railroad men keep those rates on a cost basis and that they are based on a cost proposition. As soon as you depart from that cost proposition you depart from their relation to the expenses.

Q. Is it not an axiomatic truth, Mr. Hillman, that in railroads as in any other business, there is of necessity a relation preserved between the cost of producing the service rendered and the compensation that is required for rendering it? I mean, as a whole. I am not speaking in detail.

A. As a general proposition, that is the supposition. That is the reason I say, as I said when I started my direct testimony on that point, that it is an indicative factor, and that it was used by courts in making decisions because no other factor had been presented to them. While it is an indicative factor, it is not the factor. It is better than a guess and that is all you can say for it.

Q. Do you know any business in which the value of the property used in the business is measured by the expense of producing the output of that business?

A. Where the use of that property is joint, yes, sir. Where the use of a certain facility is distinctive to its own class of business,

the cost of that particular facility should be charged to that business.

3597 Where the use is mixed and joint it should be upon the basis of the expense.

Q. I understand that, but the point I want to call your attention to is a little different, I think. It is this:

We are speaking now, first, as to the value of the property:

Can you cite any instance in which the expense segregated from the earnings, the revenue that is produced, is used as a factor of estimating the value of property, unless it may be under some peculiar circumstances, where you say there is some joint interest where it could come in?

A. In cost accounting the expenses of a factory would be set up upon the basis of the use of floor space, machinery, steam heat and power, according to the operations and the expenses of the operations which were conducted by that power and heat and on that floor space.

Where a machine would be segregated from its general use and be used for a particular purpose, the cost of that machine would, of course, be charged against the product which is made by that machine.

As the use of the facilities of the railroad are almost entirely joint between interstate and intrastate, the expense basis governs.

I have had cases in railroads where a facility was undertaken absolutely and solely for the purpose of an interstate matter

3598 or an intrastate matter, and there that account was segregated from the expenses and the cost of that utility charged directly to that account.

Q. That was some special condition, was it not?

A. Yes, sir. I tendered this explanation to vindicate that the same method would be pursued in setting up a cost system in the factory.

Q. You stated this morning that you had taken 108 separate accounts and divided them as between state and interstate business: or, rather, you expressed your views based upon a separation made that way, as to the manner of dividing expenses between the two classes of business:

I understood you that you had prepared a formula but you told me later that you had not. I wish to ask you if you will prepare a formula or outline indicating the method upon which you would proceed in making a division as between state and interstate traffic, and file it as an exhibit in this case.

In saying that, I mean a formula based upon your views as you expressed them in your testimony, as to the proper method of division.

Mr. HILL: I do not think it is right to burden this witness with formulas. You can ask him his views, but I do not think it is a reasonable request to ask him to get up a formula.

Mr. MOORE: I do not ask that he include a great amount of figures, but I say an outline.

1513

3599 The MASTER: It is a matter between the witness and the attorney, altogether. If he volunteers to do so it will be all right, but I will not compel him to do so.

The WITNESS: I will state for the information of the attorney and the court that I declined to do so in the Missouri Case and I think that as the matter stands now,I will decline to do so in this case.

Mr. MOORE:

Q. You stated in that connection that this basis of division in which you took 108 separate accounts, reflected the expense of the state and interstate business, respectively.

Now, I want to ask you this: was the formula that you speak of made in accordance with the statement you have made in evidence today as to your views as to the basis upon which the division should be made?

A. Yes, as a general proposition.

Allow me to state right here that I stated in my testimony, when I started, that this was very general and roughly made, and while there were 108 accounts—I believe that is the number of Interstate Commerce Commission accounts——

Q. I believe that is correct.

A. I did not make 108 computations on it. I lumped them as I found them expressed upon this statement "K"—I believe it is furnished by the accountants for the state—and did it very roughly.

I do not want you to think in that matter that I made 108 computations. Knowing what I could group together, I made
3600 groups of them and roughly divided them, and that is the reason I stated that a more accurate division, and taking them item by item, would produce undoubtedly a result varying somewhat from the $30,000 difference which I stated I had.

Q. In arriving at that result did you divide the expenses between passenger and freight on the train weight basis that you spoke of this morning?

A. Yes, sir.

Q. Where did you get the data for doing that?

A. That was simply from the general idea I had of the weight of a freight train, as I quoted to you today,—a passenger train 250 tons and a freight train in the neighborhood of 900 tons—and take the switching rate into account; that is the reason I spoke of the general application.

Q. Did you think that any allowance should be made in favor of local trains on account of switching?

A. As regards the wear of the track, yes, sir, there should be some allowance made.

As regards the other expenses of running your train, what you would call your "haulage" expenses, I would determine that by the absolute allocation of my train expenses.

Q. Does that apply to road switching?

A. Yes, sir; that is, when an engine reaches its terminus, it has done a certain amount of switching, but the men are paid for their

run. There is no expense though they have done the switching. It is included in the local trains' expenses. Having the
3601 local trains' expenses, you have covered all the switching work that those men have done, but you have not covered this one point, which is wear of the track due to that switching. That is the only point that is not covered.

Q. And that is the only basis upon which you make an allowance for switching?

A. Yes, sir.

Q. Suppose your local train had lost time on account of the large amount of switching and the crew had to work overtime?

A. That is provided for in the rules of the Company. Where there is a detention at a station, the time they are detained is charged up to switching and is treated as a switching movement, included in switching mileage. That is the usual custom and I have no doubt it is so upon the roads in question here.

Q. Now, speaking again of the division of expenses between state and interstate business: I would like you to tell me if, after you divide the cost on the basis that you mentioned a while ago, you make any allowance in favor of the intrastate freight on account of the extra expense of handling, or additional expense of handling that class of freights?

A. Do you refer to train expenses, haulage expenses, station expenses, or expenses in general?

3602 Q. Expenses in general?

A. Yes, sir, we make the allowance for that in our "station expenses," the extra cost of handling. We make no allowance for the haulage expenses—that is the train expense of intra freight, beyond the fact that so much of it was hauled upon a high priced local train and so much of it was hauled upon a low priced through train.

We make an allowance for the terminal switching of intra freight by, in my method, using the ton basis for that, and outside of those we make no further allowances.

Q. How do you apportion your "Yard and terminal expenses" as between through and local trains or between state and interstate business, whichever way you may divide it?

A. I have heretofore divided that directly upon the ton basis.

Q. You do not divide it on the basis of cars handled?

A. No, sir; that is the matter of which I said a few minutes ago, that I proposed to look into and see if the method which the state used in this case is better than my own. If it is, I think—with due deference to the state and their allowing me to infringe upon their patent—I will adopt it.

Q. Does not a division on that basis assume that every car has the same handling?

A. Yes, sir.

Q. Without regard to what the contents may be?

3603 A. Yes, sir.

Q. Or what changes might be brought about by reason of the contents?

A. Yes. In two cases I have used what I call an "equated ton." That is, I have taken my less than carloads on the basis that only on an average 1/7 of the usual carload would be hauled upon a less than carload, or upon what we call the "peddling car," and have, therefore, multiplied my less than carloads, inter and intra, by seven, and to them have added the inter and intra tons handled in the carload basis and made the equasion of my switching between inter and intrastate on that basis.

Q. Does that give proper credit for any extra amount of switching that would be done in connection with intrastate freights do you think?

A. Yes, I think it would.

Q. You think that would take care of it. It is based on an assumption, of course?

A. No, sir, it is based upon an actual experiment, the data for which was furnished to me by Comptroller Gray of the Northern Pacific road, and is part of the testimony in the Minnesota case, in their preliminary papers filed to obtain the injunction.

Q. In applying it to another roads or to a different part of the same road, at different times and different seasons of the year, it would be an assumption that the conditions would be the
3604 same?

A. Yes, sir, we would assume that the conditions would be the same. It would not, however, be what I would consider a violent assumption, although there would be a variation.

Q. You stated a while ago that this division on the basis of cars handled assumes that every car has the same handling: is that a correct assumption?

A. No, sir, it does not have the same handling.

On the doctrine of averages we could safely go on that basis, however, for in handling a large number of cars—while we would pick out specific instances where this would not hold, yet on thousands of cars which they have mentioned here, the doctrine of averages would hold and render that a usable factor.

Q. The state's accountants in this case have made an allowance in dividing engine house expenses, of 12 per cent, on account of the shorter run of local trains:

How about the application of that to state and interstate, as well as to trans-state business? Do you think that would work equitably between the three classes of business?

A. Well, you cannot well apply it that way with the method which they have done, as that engine expense——

Q. It is engine house expenses.

A. The engine house expense is necessarily taking care of the engine after it has gotten in and it would be simply an expense which would have to be set up and then divided upon the
3605 basic factor.

Q. What I mean is this: those different engines are engaged in different classes of service. Some of them do much more work than others. Some of them do work in which there would be a necessity for a greater amount of repairs. Some of them haul state

freight and some of them haul interstate freight. Some of them haul trans-state freight. All of that sort of thing.

Do you believe that that allowance of 12% will work fairly all around?

A. Oh, yes, sir; that would work fairly. I don't know of any engine, though, that hauls specifically any kind of freight, such as interstate or intrastate or transstate.

Q. I understand that and what I am going to ask you is this:

Should there not be some method devised, if you are going to adopt that system, by which the onerous service of the engines, that which applies to the class of traffic which necessitates more onerous service, should not, as nearly as it could be located and fixed upon the service?

Mr. HILL: What do you mean by "the more onerous service?"

Mr. MOORE: I mean increased switching, we will say as between short runs and long runs, and those runs in which the engine is pulling a "peddling" train as against one where it is pulling
3606 a train of full loaded cars.

The WITNESS: That would have nothing whatever to do with the engine house expenses. That is simply a terminal expense. It don't matter if the engine is worked hard the whole trip or run light the whole trip. It goes to the engine house and receives the same attention anyhow. If it has undergone any damage during the time, it is charged up in engine repairs and comes into the accounts through the "Maintenance of equipment" expenses.

Q. The evidence in this case shows that the average haul on one of the lines that is engaged in this litigation, of interstate freight is as to state freight, five to one, and on the other something over three to one:

Will you make any allowance of extra expense in the handling of that state traffic on account of that difference in the haul?

A. Yes, sir, the allowance would be made in this account as handled here by the expense of through train and the expense of the local train and in the division on the ton mile haul.

Q. That is the only allowance it would make?

A. Yes, sir, that would take care of it, with the addition they have made for the extra terminal in each case, which would be required by the shorter haul.

Q. Now, in division 7 of Exhibit "K", the method of dividing train costs is developed and after that division is made on
3607 the basis of the percents that are set out in Exhibit "C", the cost of each kind of traffic is divided between intrastate and interstate in proportion to the volume of traffic of each kind handled in each class of service. This is set out in the same division.

The effect of that is to first divide the train cost as between through and local trains to ascertain the relative tonnage of state and interstate on those two classes of trains, and then divide the expenses between state and interstate traffic on the ton mile basis, is it not?

A. Yes, sir.

Q. In other words, the effect of that is to adopt the ton mile basis

as a unit of division after having made such division and allowances as the accountants thought proper for extra service, for the extra expense incident to different branches of service?

A. Yes, sir, on what we call the "haulage" items, the train service items, yes, sir.

Q. The difference between that and the ton mile theory of division, as it has been heretofore spoken of, is that the extra allowances were not—the extra allowances of increased costs were made before the ton mile theory is applied instead of after?

A. Not on the ton mile theory which has been so severely criticised. The ton mile theory which has been so severely criticised is the application of the ton mile to all expenses, whether mile-
3608 age or cost haulage, and this is simply determining the cost of the local train and then the proper factor, when you have determined that cost of the local train as against a through train, is to take the ton miles on each, as that is the proper factor for the basis of train expenses.

Q. Does that basis of division have any regard to the different kinds of commodities that make up these ton miles?

A. No, sir, it does not. It handles them directly as—that is, a ton of silk has no more to do with it than the ton of coal that is on the train.

Q. In so far as the criticisms that the ton mile basis are founded upon, the disregard of the differences in the commodities carried, this is as open to criticism as the other, is it not?

A. Certainly, the very establishment of a lump cost for both classes of service, through and local, without regard to the loading which as a general thing goes to make up those trains, is subject to that criticism.

The engine, and the fuel burned, as a usual thing do not care much what is back of it: nor does the engineer care what is back of him, whether it is a ton of coal or what, and it practically makes no difference what it is, save in the matter of the bulk which it has and therefore of a heavier load to haul to get that much live traffic over the track. In that case there would be a difference.

3609 I could readily see where a train loaded habitually with high grade stuff, where the weights hauled would be lower per carload than the heavier low grade stuff, if that was continued indefinitely it would be a matter which we would have to take under consideration, and in the commodity rates, which I have had to examine for some time for determining the cost of carrying a single commodity as against the other freight matters, I have taken that into consideration.

Q. The only item in the exhibits filed by the state in this case, in which the cost if actually ascertained from the records of expenditures is "Loss and damage to freight" in transit and wages, I believe every other item——

Mr. HILL: Wages and fuel?

Mr. MOORE: Possibly fuel.

A. It is susceptible of allocation——

Q. Well, we will assume that it is those three, but I think your

examination of the tables will show that merely on the "Loss and Damage" of trains in transit it is actually located. But aside from that, and possibly the other two mentioned, all of these divisions of expenses were made upon assumptions, more or less arbitrary, were they not, Mr. Hillman?

A. No, sir.

Q. Well, let us see——

A. I would like to explain that. I want to answer it in that way in order to make the explanation if you will allow me to do so.

3610 Q. Very well, you may do so.

A. There is an assumption in the cost of the local train that there must be 50% added to the mileage on account of the switching done.

There is also an assumption that the switching mileage is 50% more destructive to the equipment than regular line train mileage. Those two matters are assumptions and do enter into the train costs, local and through, as shown upon this exhibit, and, therefore, each of these exhibits are affected by the matter which you mention, of an assumption being in them.

But the reason I wanted to make that explanation was that having determined this cost of the through and local trains, I consider division of the expenses upon the amount of tonnage hauled of each class, inter and intra, on through and local trains as—I will not say mathematically exact, but I feel very much like saying it—I consider it in the nature of a fact.

Q. You mean after you have assumed that the differences in cost——

A. Between local and through trains, yes, sir.

Q. Now, there are a number of cases there where indirect expenses are divided on the basis of direct expenses of maintenance of way and structure——

A. Yes, sir.

3611 Q. Take the item of "Maintenance of Equipment"; "Locomotives"; and then take "General Expenses" and "Traffic expenses"—perhaps I am mistaken in saying "Traffic expenses"—take "General expenses"; that is on a basis of a direct expense:

All those are based upon the assumptions upon which the original division or the direct expense is based upon, is it not?

A. Yes, they are based upon the divisions which have preceded them. Any error in the figures which have preceded them will, of course, reflect itself in any of those matters which are divided, as you say, upon the basis of all accounts pertaining to that block or to the preceding blocks.

Q. I imagine we all agree, but I will ask your views about it: if it is not a fact that any division of expense of conducting state and interstate traffic is compelled to be founded upon assumptions, more or less arbitrarily?
